INDEX OF CONTENTS,

JANUARY TO JUNE, 1890,

A

ABERDEEN, a museum for, 556; Royal Horticultural Society, 265
 Abies bracteata, male flowers, 578, 672; *A. orientalis aerea*, 578; *A. Webbiana*, 578
 Acacia pulchella, 708
 Acalyphas, 576
 Acer platanoides, 492
 Achillea ptarmica, 705
 Adrianople, vegetable products in, 355
 Aesculus glancis, 682, 746
 Acerides Augustianum, 232, 326; *A. suavissimum* and its vars., 43; *A. vandarium*, 199
 African forest, the great, 586
 Agapetes buxifolia, 261
 Agave rigida, 292
 Age of trees, how to tell, 323
 Agricultural College, Michigan, fire at the, 651; Research Association, 721; Seed Trade Association, 772
 Agriculture, Minister of, 261
 Alexanders, 461
 Allamanda violacea, 797
 Alpine garden, the, 175, 292, 486
 Alpine regions, culture of plants in, 298
 Alpina albo-lineata, 427; *A. mutica*, 427; *A. natanis*, 427; *A. vittata*, 427
 Alstromerias, 325
 Amaryllis, see Hippeastrum
 Amelanchier vulgaris, 619
 Amorphophallus Rivieri, 427; *A. Titanum*, 339
 Amphicarpaea monoica, 796
 Anchusas, 706
 Anemone cafra, 389; *A. fulgens*, 521, 557, 620; *A. fulgens* in Scilly, 493; *A. hortensis*, 424; *A. nemorosa*, 6-pl., 675
 Anemones, 522; Japanese, 523
 Angraecum sesquipedale, 11, 136, 547
 Angraecums, 390
 Ansellia africana, 259
 Antirrhinum, 675
 Antirrhinums, 355
 Aotus gracillima, 364
 Aphis on Peaches, &c., 556
 Apiary, the, 12, 167, 262, 304, 325, 356, 420, 485, 588, 616, 718
 Apple Brabant Bellefour, 46; Gibbon's Rasset, 240; Golden Knob, 205; Mannington's Pearmain, 205; Nanny, 302; Starmer Pippin, 620
 Apple crop, 775
 Apples and climate, 202; chemical constituents of, 612; Nova Scotian, 714; Tasmanian, 719
 Apple-scale, 650
 Apple trade in Denmark, 394
 Apricot, the, 193; on walls, and in pots, 291

Araucaria imbricata, fruiting in N. England, 774
 Arbours in gardens, 550
 Ardisia crenolata, 270
 Arenaria balearica, 675
 Arisema speciosum, 339; *A. Wrayi*, 329
 Arnebia coriata, 52, 86; *A. Grifflithii*, 86
 Arppophyllum giganteum, 578
 Arams in the open air, 170
 Arundinaria Veitchii (as Bambusa palmata), 611
 Asarum, the genus, 420
 Ash, the flowering, 397, 439
 Asparagus, earliness of, 369; as a pillar plant, 591
 Asphodels, the white, 701
 Aucubas, bearing at Chiswick, 443; under trees, 620
 Auricula, Buttercup, 614
 Auricula, the, 326, 481, 611, 674
 Auriculas, yellow, 675
 Australian Association for the Advancement of Science, 234
 Australian plants, 714
 Azalea indica, 651; *A. mollis*, 718; *A. Vaseyii*, 577
 Azaleas, late flowering, 802

B

BACKHOUSE'S nursery, 300
 Baker, Mr. J. G., 770
 Balsams, 355
 Bamboos, treatment of, 719
 Bambusa palmata, 611 (should be called Arundinaria Veitchii); *B. tessellata*, 578
 Bananas, dried, 711
 Barbacenia species, 555
 Baroda, garden of the Gaekwar of, 266
 Barr, P., & Sons' nursery, 391, 419
 Baxter, Mr. W. H., 49
 Beans, Scarlet Runner, 590
 Beauty in colour and form, 579
 Beer, service-tree, 87
 Bees in Germany, 458
 Begonia manicata, 427; *B. socotrana*, 73
 Begonias tuberosa, 380, 492
 Belgian letter, 269, 363, 517
 Belgium, horticulture in, in 1889, 10
 Benary, Herr E., 49
 Berberis, the, 644
 Berberis aquifolium, 20; *B. dulcis*, 644; *B. stenophylla*, &c., 611, 619
 Berkeley, the late Rev. M. J., 712
 Berlin, Christmas flowers in, 77; International Horticultural Exhibition, 114, 293, 298, 489, 552, 773

Berlin letter, 267, 333, 452, 516, 586
 Bertolonias, 325
 Berwick, Shrewsbury, 700
 Bignonia radicans, 115
 Birds and flowers, 297, 364
 Birds, preservation of, small, 386
 Black Currant and Gooseberry hybrid, 585
 Bombay, flower show at, 677
 Books, list of recommended, 14

BOOKS, NOTICES OF.—American Florists' Directory, 265; American Garden, the, 424; Annals of Bird Life (C. Dixon), 715; Bees and Beekeeping (Cheshire), 714; Book of the Farm (Stevenson), 234; Botanical Magazine, 50, 341, 329, 490, 585, 767; Bulletin de l'Association pour la protection des plantes, 425; Cultivated Oranges and Lemons of India and Ceylon (E. Bonavia), 339; Daffodils (Hartland), 772; Days and Hours in a Garden (E. V. B.), 190; English Vegetables and Flowers in India and Ceylon (D. McDonald), 18; Entomologists' monthly, 18; Fallow and Fodder Crops (John Wrightson), 363; Flora of British India (Hooker), 554; Flora of Warwickshire (Bagnall), 522; Fruit Trade Journal, 50; Garden, the (Patnam), 425; Garden's Story, the (G. Ellwanger), 19; Gardening in India (Woodrow), 714; Genera of Pomaceae (Koehe), 491; Glimpses into Nature's Secrets (E. A. Martin), 555; Handy-book for the Young General Servant (Mrs. J. G. Baker), 125; History of Botany (Sachs), 426; Home, Sweet Home (F. Pitch), 51; How to Know Grasses by their Leaves (A. N. McAlpine), 363; Icones plantarum (Hooker), 361, 772; Illustration Horticolæ, 234, 744; Illustrations of British Fungi (M. C. Cooke), 231; Index of British Plants (Turnbull), 229; Insects Injurious to Fruits (Saunders), 617; John Rogers (by himself), 140; Journal des Orchidées, 391, 522; Journal of the Bath and West of England Society, 425; Journal of the Royal Agricultural Society, 490; Journal of the Royal Horticultural Society, 458, 548; Kew Bulletin, 170, 298, 362, 491, 617, 744, 796; Land and Forest-wirtschaftliche Aust-lungs-Zeitung, 744; Lindenia, 644; Malaisia, 490; Manual of Botany of the Northern United States (Ed. by S. Watson), 329; Names and Synonyms of British Plants (G. Warburton), 229; Nature Notes, 298; Naturalien pflanzenfamilien, 234; Orchids, their culture and management (W. Watson and W. Bean), 266, 357, 714; Plant Organisation (R. H. Ward), 714; Practical Gardener (Carter's), 490; Profitable Fruit Growing (J. Wright), 51; Reichenhachia, 713; Rosarian's Year Book, 112; Science and Scientists (Rev. J. Gerard), 363; Tropical Agriculturist, 522; Vegetable and Fruit Farming (C. Whitehead), 551; Vine, the (Thomson), 426; What to Eat, and how to Cook it, 266

Bordeaux mixture, 713
 Botanic Garden, Brussels, 268; Calcutta, 22; Cambridge, 743; Cape Town, 486; Durban, 483; Glasnevin, 329; Jamaica, 518; Manchester, 763; Oxford, 329; Palermo, 234; Queensland, 518; St. Louis, 19; Straits Settlements, 749
 Botanic gardens, &c., list of, 13; recent appointments in, 234; utilisation of, 771
 Botanists, index of British and Irish, 19, 263, 264, 293, 362, 426, 523, 657, 715
 Botanical collectors, 713; figures, 683; press, a portable, 501
 Bougainvilleas, 106
 Bouquets at the Drawing Room, 618
 Bousingault, memorial to, 19
 British Fruit Growers' Association, 320, 391; list of lectures, &c., 458, 553
 British Guiana, 749
 Broccoli, 515; a new, 522; Gilbert's Victoria late, 718, 798; many-headed, 650; Methven's June, 798; Veitch's Model, 652, 719, 775
 Bradiia Leichtlinii, 291; *B. porrifolia*, 291
 Brugmansia sanguinea, 335, 775
 Brussels, Botanic garden, fern-house at, 268; chamber of horticulture, 112
 Brussels sprouts, 261; Northern Prize, 291
 Bunting, rapid, 493, 523
 Bulb garden, 11, 262, 331, 360, 390, 461, 799
 Bulb Mite, the, and its cure, 115, 141, 173, 207; on Eucharis, 399
 Bull season of 1889, 49
 Balis and field mite, 54; at Haarlem, 329; English grown, 719; Outdoor, and the mite, 173
 Bull's, Mr. W., nursery, 134, 581
 Buphane toxicaria, 359
 Burford Lodge, flowers at, 43

Burton, Messrs. T. & Sons, Peach grounds, 555
 Baysman's preparatis, M., 681

C

CABBAGE, Chou de Burghey, 719, 745; Rosette Colewort, 739
 Cacti, hints on, 714
 Caladiums, &c., 391
 Calanthe Mylesii x, 578
 Calanthes, hybrid, 73
 Calceolarias, 774; shrubby, 461
 Calla aethiopica, 493
 Callas, multiple spathed, 142
 Calypurnia lasiogyne, 389
 Calycanthus floridus, 676
 Cambridge Botanic Gardens, Water-Lily house at, 743
 Camellia buds dropping, 55, 143, 240
 Camellia reticulata, 364
 Camellias, 417; at Messrs. C. Lee & Sons, 266
 Campanula isophylla, 430
 Canford Manor Gardens, 524
 Cannell, Messrs. H., & Sons Nursery, 238
 Carex variegata, 23
 Caricas, hybrid, 202
 Carludovica caput medusae, 797
 Carnation and Picotee Union, 232, 744
 Carnation Louis Bernhard, 166; C. Madame A. Warocqué, 19
 Carnations and Picotees, 165, 301, 733
 Carnations, Tree, 165, 239
 Carron House, 427
 Carrot, Early Nantes, 791
 Castilleja indivisa, 291
 Castle Kennedy, Rhododendrons at, 642
 Catasctum Bungei, 618, 735; C. pileatum, 610
 Caterpillars and fruit trees, 328, 386; in fruit-houses, 634
 Catha edulis, 51
 Cats in gardens, 55, 175
 Cattleya Bellantianiana x, 644; C. citrina, 547; C. eldorado creata, 708; C. labiata Rochelleana, 326; C. l. Warneri, 708; C. Loddigesii candida, 236; C. maxima var. Malouana, 236; C. m. Marchettiana, 578; C. Morganæ x, 708; C. Mossiae alba, 708; C. Percivaliana, 78; C. Trianae alba, 230; C. Trianae, forms of, 644; C. T. Mesuriana, 239
 Cattleyas, malformed, 265, 461
 Cedrus atlantica fastigiata, 197
 Celery, 294, 524
 Celery, Standard Bearer, 459, 492
 Centropogon Lacyanus, 397
 Cerasus japonica, fl.-pl., 718; C. pseudo-Cerasus, 650
 Cercis siliquastrum, 718
 Chalky soils, trees and shrubs for, 270
 Chamæcyparis sphaeroides, 478
 Cheal, Mr. John, 755
 Cheiranthus Marshalli, 720
 China-grass in Wenchow, harvesting, 716
 Chinese dyes, 796; gardens, 113; plants, 554; Sacred Lily, 23, 206, 230, 265, 303, 300
 Chironia palustris, 235
 Chiswick House, Camellias at, 397
 Choisy ternata, 645, 682
 Chrysanthemum Etoile de Lyon, 52; C. Jane, 109; C. Maid of Guernsey, 491; C. Mrs. S. Coleman, 52, 240
 Chrysanthemum fever, the, 50; show at Edinburgh, results of the, 80; show at Ghent, 203; show dates, 53, 86
 Chrysanthemums at the antipodes, 10; at Chiswick, 585; groups of, 76; in Vienna, 170; specimen, 109; trained specimen, 271, 303
 Cinchona plantations in Bengal, 22
 Cin-raria centenary, and others, 51
 Cinerarias, 204; at Great Doods, 303
 Citron, the Buddha-fingered, 383

Clay land, heavy, 23, 55, 206
 Clematis, the, 292, 397
 Clianthus puniceus, 430
 Cliveas, 228
 Clover and grass crops, 238
 Clyde disaster, the late, 18, 771
 Cockroaches, to destroy, 518
 Cologyne flaccida, 299; C. Lowiana, 554
 Coffee, Arabian, 74
 Colchicum procurrans, 271
 Colonial appointments and Kew, 190
 Colonial notes, 262, 384, 486, 518, 646, 749
 Coltsfoot, early blooming of, 139
 Columbines, monstrous, 632
 Colwyn Bay, plants at, 397
 Compass plant, the, 51
 Conifers, Japanese, 591
 Consett Park, 554
 Coombe Wood Nursery, 577
 Copper, sulphate of, 798
 Coprosma Baueriana, 265
 Cottonia macrostachya, 234
 Cotton-seed oil, new uses for, 387
 Covent Garden, Floral Fete in, 649; measures, 15
 Crab, the Siberian, 645
 Crabs, Medlars, and Quinces, 678
 Craig-y-nos Castle, 209
 Cranberry, diseases of, 362
 Crinodendron Hookerianum, 430
 Crinum purpurascens, 555, 591
 Crocus Balanus, 262; C. minimus and C. suaveolens, 302; C. stellaris, 390
 Crotalaria Cunninghami, 555
 Crotons, propagation of, 165
 Cuckoo, the, 652
 Cucumbers, culture of winter, 40, 143; grafting of, 139
 Cultural memoranda, 165, 335, 389, 490, 614, 657
 Cuttings, 366
 Cyclamen europæum, 522
 Cydonias, 682
 Cymbidium eburneum, 356
 Cymbidium, 164
 Cyperus alternifolius, 335
 Cypress, the deciduous, 324
 Cypripedium argus, 259; C. barbato x Veitchianum, 578; C. Bachaniana x, 142; C. callosum, 202; C. calceolatum x, 414; C. Elliottianum, 451; C. hirsutissimum, 199; C. insigne, 42, 143; C. Lemnienianum x, 610; C. orphanorum, 16; C. Phœnœum and C. dolare, 235; C. Rothschildianum, 235; C. Spicerianum and C. Morganæ x, 264; C. villosum, 135; C. vittatum breve, 644
 Cypripedium hybrid, a complex, 547; vote, a, 552
 Cypripediums from Liverpool, 198; two-flowered, 617
 Cystanthus obliquus, 450; C. pallidus, 490
 Cytisus Adami, 579.

D

DACRYDIUM Bidwillii, 433; D. laxifolium, 258
 Daffodil Sir Watkin, 355, 396
 Daffodil Conference, the, 323, 394, 458, 462, 488, 493, 520, 526
 Daffodil farming, 452; King, the, 449; natural history and cultivation of the trumpet, 526; selection, 553; a sporting, 491
 Daffodils at Ard-Cairn, 205; double, from seed, 429; for market, 527; from seed, 652
 Dahlia season, the, 590
 Daphne cneorum, 365; D. mezereum and green-finches, 775
 Darlingtonia californica, 50, 84
 Dell, The, Egham, 552, 585
 Dendrobium Brymerianum, 451, 644
 D. ermenatum, 11; D. Devonianum, a specimen, 680; D. heterocarpon x Fendleyanum, 104; D. Mur-

belianum, 326; D. Schneiderianum x, 136; D. a seedling, 365; D. transparent, 136; D. Wardiana var. Lowii, 578
 Decorations, dinner-table, 202
 Diacrium bicornutum, 579
 Dianthus chinensis, double, 366
 Dianthus fungus, 142
 Dielytra spectabilis, 239
 Diervilla Middendoriana, 581
 Disa graminifolia, 452; D. tripetaloides, 766
 Disease of Craoberry, 362; of Dianthus 142; of Hyacinths, 139; of Lilies, 763; of Lily of the Valley, 643; of Orange, 518; of Peach, 518; of Pear tree, 205; of Plums (silver-leaf), 114; of Strawberry leaves, 798
 Diseases of plants, 616
 Dornicum plantagineum excelsum, 577, 683
 Double flowers, 554
 Dracæna Lindeei, 143
 Dracænas, 390
 Dried flowers and the influenza, 328
 Drimys Winteri, 674
 Dropanore, 789; shrubs in flower at, 492
 Drosera cistiflora, 234
 Dublin, weather in, 86
 Dyes, Chinese, 796
 Dykes of Lincolnshire, 590

E

EAST SHEEN Lodge, 765
 Echium arboreum, 450
 Economic botany, notes on, 717; plants in Central Africa, 710
 Edgings in gardens, 608
 Edinburgh Exhibition, 575, 710
 Elder, the red-berried, 57, 106, 175, 206, 378
 Electric light carbons, 23
 Elizabethan England, 164
 Elstead, Phalœnopsis at, 164
 Embotrium coccineum, 716
 Empiricism or rationalism? 298, 319, 353. (See also Gardeners' Problem)
 England, Elizabethan, 164

 Epiphyllum Russellianum Gaertneri, 746
 Epiphyllums and their propagation, 172
 Epping Forest, 202; mismanagement of, 771
 Eranthemum pulchellum, 355
 Eranthus in flower, 646
 Eualedia eminus, 450
 Eucalyptus and influenza, 130
 Eucalyptus citriodora, oil of, 19; E. globulus seedling, 170
 Eucharis amazonica, 192, 271, 302, 333, 365
 Eucharis, Bulb mite on, 360
 Eupatorium odoratum, 657
 Euryclæ species, 556
 Exchange in gardeners, 203
 Exochorda grandiflora, 582, 613
 Exochordas, 614

F

FAGUS Solanderi, 578
 Falkland Park, 700
 Ferns, Canadian, 51; latent life in, 265; a chat about, 362; fragrance in, 225, 302; vagaries of variation in British, 479, 514

Fern-spores, longevity of, 256
 Fernando Noronha, 554
 Fertilisation of flowers, 554; the process of, 491
 Field escapes, 745
 Fig St. John, 719
 Fire blast, 205, 335
 Flora of Mexico, 458; of Paraguay, 266; of Queensland, 332
 Floral decorations, 139
 Floral Fete, Covent Garden, 649
 Florida and New York, 671, 706, 767
 Florists' flowers, 10, 52, 109, 165, 204, 301, 326, 356, 388, 419, 483, 559, 641, 674, 739
 Flower garden, operations in the, 108, 167, 230, 263, 265, 327, 358, 423, 487, 551, 615, 678, 741, 795
 Flower painting, 705; pots, Oetzmann's, 652; sermons in London, 681; and plants for the London poor, 744
 Flowers at Cork, 51; double, 554; in season, 113, 681; preservation of, cut, 23
 Fog, effects of, on plants, 415, 461, 492, 648
 Foreign correspondence, 10, 57, 106, 144, 267, 293, 322, 363, 390, 452, 516, 586, 646, 791
 Forestry, 678; in the Colonies and India, 329; school of, 618
 Forests of North America, 51
 Forsythia viridissima, 582
 Foster's, Professor, garden, 322
 Fraxinus ornus, 294
 Freesias, 165
 Fritillaria acropetala, 490
 Frost in June, 798; in North Wales, 744
 Frosts, and Roses, 366; late, 366; recent, 775
 Fruit at the antipodes, 522
 Fruit crops and weather, 239, 491; report on the, 744
 Fruit culture, 49, 174, 456
 Fruit culture and the Fruiters' Company, 188, 139, 174; farming, 712; growers' grievance, a, 681; market, the, 716; pests, 583; prospects, 718, 774, 798; register, 46, 205, 460; show in the city proposed, 771, 798
 Fruit-trees and caterpillars, 386; mulching, 546; renovating hardy, 390; staking young, 239
 Fruits under glass, work among, 13, 79, 109, 136, 166, 190, 231, 295, 327, 359, 391, 422, 455, 487, 519, 551, 583, 615, 617, 679, 711, 741, 763, 795
 Fruiters' Company and fruit culture, 138, 139, 174, 771, 798
 Fuchsia arborescens, 675
 Fuchsia grandiflora, 490
 Funkias, 431

G

GALANTHUS nivalis Scarthlocki, 329; G. Redoutei and G. latifolius, 206; G. umbrius, 107, 207
 Garden scholarships, 49
 Gardens, Chinese, 113
 Gardénia Stanleyana, 450
 Gardening, a history of English, 74, 197, 258, 417, 482
 Gardening periodicals, list of, 14
 Gardeners' Orphan Fund, 18, 54, 71, 86, 114, 143, 168, 290, 296, 319, 360, 384, 424, 461, 553, 649, 712, 770
 Gardener's problem, a, 16, 48, 54, 86, 116, 140, 161, 174, 194, 227, 260, 298, 319, 353
 Gardeners' Royal Benevolent Institution, 82, 113, 138, 232, 680, 712, 719, 770
 Gaudénia, 390
 Gardiner, Mr. W., 771
 Gaylussacia frondosa, 580
 Geuista scoparius var. Andreanus, 577
 Ghent Chambre Syndicale, 235, 329, 523, 771; certificates, 490

Ghent, rare plants at, 395
 Gilbert, Dr., 265, 329
 Gillyflowers, 366
 Ginger beer plant, 653
 Girdling trees, 651
 Gladiolus, the, 388; *G. Colvillei* alba, 790
 Gloxinias at the Temple Show, 719; at J. Veitch & Son's, 771
 Godwinia gigas, 330, 389
 Gongora maculata, 11
 Good Luck Lily, the (see Chinese Sacred Lily)
 Goodyera discolor, 198
 Gooseberry and Black Currant hybrid, 585
 Gooseberries, large, 53
 Gordon's nursery, 522
 Grafting Cucumbers, 139; effects of, 582
 Grahamstown, weather in, 425
 Grammatophyllum speciosum, 334
 Grange, The, Hackbridge, plants at, 729
 Grape, Mrs. Pearson, 46
 Grapes, colouring of, 511; of Eschol, 362
 Greenhouse, the Amateur's Beeston, 52
 Greivilleas for cutting purposes, 389
 Gurjun oil in skin diseases, 18

H

H. MANTHUS multiflorus, 389
 Hanbury Institute, the, 489
 Hardwooded greenhouse plants, 11
 Hardy fruit garden, work in the, 79, 108, 136, 167, 204, 231, 263, 295, 327, 359, 423, 455, 487, 519, 551, 615, 647, 679, 729, 741, 769, 795
 Hardy, M., 716
 Hardy shrubs, 616, 654, 745
 Hartland, Mr. W. B.'s nursery, 681
 Heather, the, in America, 265, 439
 Heatherbark, mould caves at, 174
 Heaths and clay, 303
Helicodiers crinitus, 459
Heliconia niger var. *angustifolius*, 87, 114
Hemiorchis burmannica, 797
 Herbaceous border, 291; plants, 796; arrangement of, 25
 Herbarium, arranging plants in, 586
 Heredity, 736, 742
 Linden, sacred trees of the, 75
 Hippastrum, the, 386
 Hippastrums, Mr. Veitch on, 329
 Holly, forced, 112
 Holyhock, the, 483
 Hornbeam, with Thorn embedded in it, 682
 Horticulture, a hall for, 18, 49, 86, 111, 142, 206, 264, 279, 298, 361, 458, 529
 Horticultural archaeology, 650
 Horticultural club meetings, 235, 360, 424, 490, 520, 585, 649, 797
 Horticultural College, Swanley, 770
 Horticulture, essentials to success in, 592; in Belgium in 1889, 10; science of, 677
 Horticulturists, list of famous, 19, 203, 265, 299, 362, 426, 523, 657, 715
 Houletia Brocklehurstiana, 326
Humea elegans, 389
 Hyacinths, mucous disease of, 139
 Hybrid between Black Currant and Gooseberry, 585
 Hybrids, microscopic structure of, 543
 Hyde Park, 770

I

 Ice-flakes, 50
 Impney Hall, 790
 India, gardening in, 773; forestry in, 794
 India-rubber, 651

Insect pests, to destroy, 426, 518
 Insects injurious to fruits, 647
 Insects, insecticides, and fruit trees, 386, 518
 Insecticides (fruit pests), 585; use of, 681
 Iris Bakeriana, 76, 106, 292; *I. Bornmüllerii*, 106, 296, 292; *I. iberica*, 646; *I. Persica*, 577; *I. Rosenbachii*, 390, 577; *I. Siedjarensis*, 364, 366; *I. Sophemensis*, 106
 Irises, 768; at Chiswick, 741; spring-flowering, 292, 577
 Ivy, yellow-berried, 714
 Ixias, 11

J

JACARANDA mimosaefolia, 427
Jacobinia coccinea, 75
 James, Mr. J. S. nursery, 297, 482
 Japan, plants of, 714
 Japanese Conifers, 591; eccentricities, 8; plants, a catalogue of, 554
Juniperus canadensis aurea, 378; *J. prostrata nana*, 577
 Justice or injustice, 798

K

KIMPERIAS, 392
 Kenward, Peaches and Nectarines at, 652
 Keroseene emulsions, 387
 Kew and Colonial appointments, 490
 Kew notes, 196, 399, 364, 389, 459, 555
 Kingston Chrysanthemum Society, 386
 Kitchen garden, work in the, 13, 47, 79, 113, 137, 164, 199, 231, 263, 295, 327, 359, 391, 423, 455, 487, 519, 551, 583, 615, 647, 679, 711, 741, 769, 795
 Kitchen garden notes, 388
 Knole, King John's Oak at, 712

L

LACHENALIA pendula, 462
 Lackey moth, caterpillars of the, 654
 Laeken, destruction at, 29
Laelia anceps and vars. at The Dell, 43; *L. Dawsonii* and its vars., 498, 239; *L. a. Hyeana*, 578; *L. a. white*, 239; *L. Crawshayana* and *L. Gouldiana*, 78, 135; *L. Dormaniana*, 578; *L. elegans Blenheimensis*, 108; *L. flava*, 119; *L. glauca*, 356; *L. Gouldiana*, 42, 171; *L. G. var.*, 11; *L. Gouldiana* and *L. Crawshayana*, 78, 135; *L. monophylla*, 136; *L. purpurata* var. *Russelliana*, 798
Laelia species, list of, 107, 256, 333, 355
 Laing, Messrs. J. & Sons' nursery, 356
 Laird, Messrs. R. B. & N. Sons' nursery, 471
 Lamington and its late lord, 270
 La Mortola, frost at, 339, 391; plants at, 395; winter flowering plants at, 322
 Landscape gardening, 426
 Lapagarias at Tretham, 23
Lathraea clandestina, 329
Lathyrus Sibthorpii, 715
 Laurels, pruning, 22

LAW REPORTS.—Harvey v. Kirby (partnership), 175. Nursery and Seed Trade Association v. Wise (obtaining goods under false pretences), 89, 118, 145, 241, 334; Radcliffe & Co. v. Phillips (values), 368; Van Geert v. Carter & Co. (unsaleable plants), 336, 368, 400

Lawns, 462; renovating and managing, 334

Lawson, Professor George, 80
 Leamington, Jepson Gardens, carpet bed in the, 369
 Leaves, chlorophyl in buried, 645; removal of, from Vines, 557
 Lee, Messrs. C. & Sons', nurseries, 266
 Leeks, 262
 Leguminous crops, growth of, 793
Leschenaultias, 730
 Lettuce, the Cabbage, 430; seed, acclimatised, in India, 431; wintering, 339
 Lettuces on north borders, 791
Libocedrus decurrens, 554
 Light, action of, on plants, 236
 Lightning, Turkey Oak struck by, 105
 Lilies, double-flowered, 55
Lilium auratum, 331; *L. Harrisii*, 779; *L. longiflorum*, for forcing, 425
 Lily disease, 763; flowers, 681; *L. Good Luck* (see Chinese sacred)
 Lilies, 771; culture of, 292, 302, 335, 395
 Lily of the Valley, 462, 683; disease of, 643; for forcing, 115; home-grown, 396, 439, 654
 Lindley Library, the, 15
 Linton Park, 639
Lisianthus, 489
 Lockinge, Wantage, 40, 161
 London Purple, 201, 585, 714
 Longford Castle, 619
Lonicera sempervirens minor, 718
 Low, Messrs. H. & Co.'s nursery, 299
 Lycaste Skinneri alba, 236, 399; a fine, 198, 424
Lycobis Lagasce, 292; *L. vespertina* and *L. stylago antherarum*, 27

M

MADRAS, flower show at, 716; forest department, 794

"Mr. GEORGE SCUMMERS, *Gardener to the Earl of Scarborough*—
"DEAR SIR,—I have grown your President Carnot Brussels Sprouts by the side of several other well known varieties, and have come to the conclusion that it is the hardest and best variety grown."
London Wholesale Agents:—HURST AND SON, 152, Houndsditch, E.; COOPER, TABER AND CO. (Limited), 91, Southwick Street, Borough, S.E.

LILIES and ORCHIDS. An immense stock of recently imported Plants, compels a sale of the Established Plants to make room. They have not yet flowered, but are all flowering plants, and must be sold at a great sacrifice. Very valuable varieties are certainly to be obtained, and great bargains; see public journals for high prices recently obtained. The special offer affords a paying investment to anyone with glass at command, which should not be overlooked. Such plants may never again be offered to the public and trade.

My first consignments of LILIUM AURATUM have arrived, prices 4d., 6d., 9d., 1s., and 1s. 6d. each; per 100, 30s., 35s., 43s., 55s., and 70s. Liberal allowance to the Trade.

**THE NEW BROCCOLI
SUTTON'S
BOUQUET.**

Described and Illustrated in the "Gardeners' Chronicle," June 8, 1889.

This new Broccoli differs in character from every other member of the Brassica tribe. The central head is surrounded by several smaller heads, varying from five to twelve in number. The advantage is two fold—augmented produce and an extended duration of the crop, for the principal head is ready for cutting several days in advance of the branches. Sutton's Bouquet is a very late Broccoli, and perfectly hardy, having endured severe weather that has destroyed many other kinds. Our supply of seed is extremely limited.

The Editor of the *Gardeners' Chronicle* says:—"Let me should be thought to exaggerate, we set down the measurements of this Broccoli, 2 feet in height, 3 feet across, 9 feet in circumference; in each case the dimensions were more than we have stated, but we have omitted fractions. The main stem produces 4 main branches each with 5 heads." June 7, 1889.

Price of Seed, 3s. 6d. per Packet,

JAMES VEITCH & SONS, ROYAL EXOTIC NURSERY, CHELSEA.

WILLIAMS' NOVELTIES FOR 1890.

Sold only in Sealed Packets bearing our Trade Mark.

EARLEY'S HARDY CURLED SPROUT.

This new variety was raised by Mr. William Early, of Bford, from whom we have secured the entire stock of this valuable Vegetable. He describes it as follows:—"A cross between the Brussels Sprouts and Kale, Scotch Curled. The latter was crossed with Brussels Sprout pollen. This has produced a robust variety with true Brussels Sprout habit, the foliage being midway between the two parents.

Per Packet ... 2s. 6d.

NEW ORNAMENTAL-LEAVED BEET. (McGREGOR'S FAVOURITE.)

Awarded First-class Certificate by the Royal Horticultural Society, September 25, 1888.

The leaves are of a rich bronzy-rose colour, narrow, arching, about 6 to 8 inches long, and fold inwards, resembling in habit a narrow leaved Dracena.

Per Packet ... 1s.

PRIMULA SINENSIS FIMBRIATA, "FIRE-FLY."

A beautiful semi-double variety. The colour is of a deep crimson, somewhat more intense in shade than "Met-ur." It comes very true from seed, and will be found most serviceable for conservatory decoration.

Per Packet ... 3s. 6d.

PRIMULA SINENSIS FIMBRIATA, "EMPRESS."

This is a very fine semi-double variety. The colour is a delicate pink of a very pleasing tone.

Per Packet ... 3s. 6d.

Illustrated Seed Catalogue for 1890, containing descriptions, Illustrations, Testimonials, &c., will be forwarded gratis and post-free to all applicants.

B. S. WILLIAMS & SON,

Victoria and Paradise Nurseries,

THE Gardeners' Chronicle. SATURDAY, JANUARY 1, 1890.

NOVELTIES OF THE PAST YEAR.

FOLLOWING the time-honoured practice of reviewing the triumphs and gains of horticulture during the preceding year, and taking note of the novelties in plants introduced from foreign sources, or raised by our hybridists at home, we now afford our readers once more a condensed account of the last year's work.

Undoubtedly the greatest object of interest which has passed under review is the *Amorphophallus titanum*, which flowered in the Royal Gardens, Kew, last June, and about which sufficient was said at the time. Among the

ORCHIDS Brought into notice during the past year, Messrs. James Veitch & Son have, as usual, introduced many fine things, their marvellous and extensive collections of hybrids furnishing some of the best plants of the season. Their *Cymbidium churruco-Lowianum* is a noble plant, with large wax-like fragrant flowers, with sepals and petals delicately tinged like old ivory. The *Laelio-Cattleya aurora* and *L.-C. Cassiope* are both fine plants, with forms of *Laelia purpurea* as one of their parents, and whose influence aids greatly in securing plants of dwarf habit, with richly coloured flowers of great size. The beautiful *Laelia Victoria*, raised by Messrs. Veitch, has, during the past year, been awarded a Certificate in the case of a plant shown by Baron Schroder, as well as the chaste *Dendrobium cucullatum leucopetrum* and *D. micans*, the latter a *D. Wardianum* and *D. lituliflorum*, and both of the most beautiful of recent hybrids have received honours from the Royal Horticultural Society. *Laelio-Cattleya Pallas*, for which Messrs. Veitch received a First-class Certificate on December 10, is a fine novelty, with very rich colouring in the labellum. But the plant which attracted more attention than any other during the year was the

same firm's L.-C. Digbyana—Mossie x, that exquisitely formed flower with the colour of C. Mossie, and quaint fringed lip of Lælia (Brasavola) Digbyana, which was exhibited at the Royal Horticultural Society on May 14, and for which the Orchid Committee unanimously voted a Silver Medal.

Another much admired plant is the beautiful white Lælia autumnalis alba, flowered by Messrs. Veitch during last year, and which when exhibited divided attention with the lovely Lælia prestans alba, for which Mr. William Bull the same day received a First-class Certificate, and which is one of the finest and rarest introductions of the year. The handsome *Cypripedium Tautzianum* Lipidum has flowered with Mr. Bull, its introducer, and at the same establishment several fine spotted *Odontoglossums* and new forms of Lælia elegans and L. purpurata—notably L. p. rubicunda have appeared.

Another worthy introduction of 1889, which has not yet flowered, but which was determined at Kew as distinct, is *Grammatophyllum Measurianum*, imported by Messrs. F. Sander & Co.; the plants are stout growers, ornamental in habit, and when they bear the long dense spikes of richly-coloured yellow, crimson, and purple flowers, as indicated by the dried specimens, they will form fine objects. Also with Messrs. Sander during 1889 have flowered their new hybrid C. labiata *Hallantiniæ* x, a good thing, which flowers when "labiatus" are scarce; their *Dendrobium nobile Sandriannum*; one of the largest and brightest-coloured forms of that favourite plant, *D. transparens album*, a very desirable variety. Their *Odontoglossum Wendlandianum* and *O. Hunnewellianum* are pretty introductions, the former very rare, and the latter plentiful, and exhibiting great variety, some of the forms being indifferent, while others are very neat and beautiful. *Cattleya Brymeriana* has also been certificated to the St. Albans firm, who have also late in the year flowered several quite new species, which had better, in justice to them, stand over until next season.

Messrs. Hugh Low & Co. scored in 1888 with the charming *Vanda Amesiana* and *Phalenopsis gloriosa*, last year the companion plants, *Vanda Kimballiana* and P. *Schilleriana alba*, certificated to Geo. Firth, Esq., were two worthy introductions accredited to them. *V. Kimballiana* is a gem requiring a cool temperature, growing freely, and producing profusely its rich flowers with their admirably contrasting amethyst labellums. The pretty specimens certificated to Messrs. Low and Sir Trevor Lawrence on August 13, took the fancy of all, and since that date the beauty and usefulness of the plant have been proved everywhere. The first of the Lowian hybrids, too, C. *Claptonense* x, a cross between C. *Harrisianum* and C. *Villosum*; and another distinct variety, C. de Witt Smith x, between C. *Spicerianum* and C. *Lowii*, has to be recorded from Messrs. Hugh Low & Co.

The *Cypripediums* appearing from many establishments, the result of their hybridising operations, threaten to become confusing, unless some means be adopted for fixing the same names to the same crosses wherever they may have been obtained. One of the prettiest of the season is C. *Niobe* x, which Messrs. Jas. Veitch & Son obtained between C. *Spicerianum* and C. *Fairriannum*. All the forms previously raised with the last named for one of the parents are indescribably attractive, and C. *Niobe* x is no exception; C. *Galatea majus* x, too, a cross between C. *Harrisianum* and C. *insigne* (Chantini), which Mr. Ballantine recently flowered in

Baron Schroder's collection, is a good thing. C. T. B. Haywood, from the same collection, is fine; and the C. *midissimum* of Mr. Norman Cookson, a cross between C. *caudatum* and C. *conchiferum*, is a fine addition to the free-growing *Selenipedium* section, at whose head the noble C. *grandæ* x of Messrs. Veitch yet stands. Mr. Cookson also obtained the stately C. *Pitheirium* x and a pretty hybrid in *Masdevallia Courtauldiana* x; and Messrs. Veitch two more in M. *Elisiana* x and M. *caudata-Estrade*, all of which have been duly described in these columns.

In the hybrid houses of Drewett O. Drewett, Esq., at Riding Mill-on-Tyne, C. *Beatrice* x, a form obtained out of C. *Lowii* and C. *Boxallii*, has flowered, also other interesting varieties, the best of which is probably that resulting from the intercrossing of C. *caudatum* and C. *Schlimii*, though how it is to make way against C. *Schroderi*, which is a step in advance of it, must be left for collectors to determine.

In the famous collection of Sir Trevor Lawrence, Bart., M.P., two long-nursed hybrid *Cypripediums* flowered in 1889, viz., C. *picturatum* x, a flower somewhat resembling C. *Hornianum* x, and of which the parentage is not recorded, but in its production C. *Spicerianum* evidently took part, and C. *Morganæ*, Burford variety, a slightly varying and good form of the noble C. *Morganæ* x, raised by Mr. Seden at Messrs. Veitch & Son's establishment; *Acinetæ*, maculata, *Catasetum barbatum probooscoidum*, *Maxillaria fuscata*, and other new or rare Orchids of especial botanical interest, have been exhibited by and certificated to Sir Trevor Lawrence during the year; and in the same class of plants the interesting collection of A. H. Smee, Esq., at Hackbridge, has contributed a number of quaint and showy things. It is pleasant to note the rising interest in *Catasetums*, several new forms of which have lately appeared in the collection of Messrs. B. S. Williams & Son, one new form of C. *tabulare*, named C. t. *heve*, from its departure from the type, curiously enough flowering in a batch, and all consistently alike. The new *Catasetum galeritum pachyglossum*, of Sir Trevor Lawrence, gives another instance of variability in this eccentric genus.

Among the species of *Cypripedium*, C. *Rothschildianum* and C. *Elliotianum* have both been well exhibited, the former by Mr. Hill, from Lord Rothschild's gardens, and the latter by Mr. Whellans, from the Duke of Marlborough's, from whence, also, some new forms of Lælia elegans are reported.

Other fine new Orchids which have appeared in 1889 are *Sobralia xantholeuca alba*, Veitch & Son; *Cypripedium Minerva* x (Measures), *Odontoglossum grande*, Tautz's var.; *Miltonia vexillaria purpurea*, and the pretty *O. egregium* (F. G. Tautz), *Dendrobium nobile album* (Seeger & Fropp), *Eulophia bella* (W. E. Gumbelton), *Pharus philippinensis* (Veitch), *Odontoglossum Pescatorei Thomsonianum* (Pollott); and among other grand exhibits from Baron Schroder's rich gardens, Lælia *Dellensis*, a natural hybrid, in appearance half-way between Lælia *purpurata* and L. *Peruvia*, and with a richly-coloured violet-purple lip, received a First-class Certificate; also *Miltonia vexillaria Leopoldii*, the highest of the subsera type; and the already noted *Cattleya Mendeli Rothschildiana*.

Among Cape terrestrial Orchids which seem to be getting into favour, two new introductions should be noted, viz., *Disa tripetaloides*, n. sp., N. E. Brown, a most free-growing plant of the *D. grandiflora* type; and *D. pulchra*, a noble

species as showy as a *Gladiolus*, but whose behaviour under cultivation has yet to be proved.

Among other new plants illustrated in the *Gardeners' Chronicle* in 1889, the following of the above-noted appear:—

Cypripedium Pitheirium x, Jan. 19, p. 73.
Lælia Digbyana-Mossie, May 25, p. 457.
Vanda Kimballiana, Sept. 21, p. 335.
Amorphophallus titanum, June 15, p. 745, 748; July 6, p. 12, 20, 21 (in various stages).

(To be continued.)

PLANT PORTRAITS.

BERTOLONIA MADAME ALFRED BLEU.—Ground colour olive-green, densely spotted with crimson, and with the prominent ribs milky-white. *Revue Horticole*, December 16.

PEAR SUCRÉE DE MONTLUCON.—Recommended for its fertility. It is of medium size, does well on the Quince, is juicy, and well flavoured. *Bulletin d'Arboriculture*, &c., December.

JAPANESE ECCENTRICITIES.

THE display at the recent Paris Exhibition of specimens of Japanese patience and ingenuity excited great interest. The illustrations which we now give will serve to show the general character of the results obtained.

In the mountain scene (fig. 1), copied from a book brought home by Professor Moseley—the rocks measure about 18 inches in height, pierced with holes, to imitate caverns, and placed in water. Little ships sail on the water, and various plants such as Bamboos, Palms, and the like are planted at the water's edge. The rock represents a landscape with houses, and little villages with little human figures placed at the foot or at a certain height on it, and planted with groves or single large trees.

The imitation is carried so far that the various forms of the rocks, tufa, stalactites, limestone, &c. are all correctly represented. These "miniature rock-gardens for rooms" are so much in favour in Japan, that they may be found in the dwellings even of the poorest classes. M. Vallon and M. P. Maury have recently devoted interesting articles in the *Bulletin of the Botanical Society of France* to a discussion of the methods employed by the Japanese and Chinese in producing the stunted trees made use of for room decoration. In some instances a Pine tree is sawn across at a little distance above the soil. Adventitious shoots are produced in consequence, and of these one is preserved, the others being cut away. The new shoot is allowed to grow for a little while, and then nearly the whole of it is cut away and replaced by a lateral shoot bent at right angles; a new leader shoot is formed from this, and is treated in the same manner, and so on. The Japanese also cut across the main tap root, as a result of which many side roots are formed, only the tips of which are allowed to remain in the soil, so that what with the continued pruning and twisting of the branches and the suppression of the main roots, a stunted growth is assured, and maintained by continuous attention and prolonged starvation. The trees made use of are mainly Coniferous, but others, such as *Trachelospermum jasminoides*, *Nandina domestica*, Japanese Maples, &c., are employed, the latter plants being grafted. Under this treatment the trunk often assumes the form of a large irregular mound, which may be of a very considerable age—a century or more—though of such small dimensions (see fig. 2, p. 12). Naturally, from the amount of attention and time required to produce them, the price of these productions is high.

M. Maury adds some interesting particulars which he received from a Japanese botanist. The seeds are sown in very small pots, the seedlings are allowed to grow till the pots are full of roots, when they are

shifted into other pots scarcely larger than before. Thus treated the greater part of the main tap-root dies, the remaining portion emitting secondary roots, which are subjected to a similar starving process, with a result that they often project above the surface, and support the plant as on stilts. The branches as they grow are tied down and twisted in all possible directions, something after the approved pattern of a specimen plant at a European flower show! M. Maury states that actual pruning is not resorted to, the starving and bending of the new shoots as they are formed being

NEW OR NOTEWORTHY PLANTS.

AERIDES AUGUSTIANUM. Rolfe, n. sp.

A species of this beautiful but difficult genus has been sent to Kew for determination, by M. Lucien Linden, Administrative Director, L'Horticulture Internationale, Parc Leopold, Brussels, which appears different from any species I can find described, and for which the above name is proposed. It is allied to *A. Roebleinii*. Rehb. t., but differs in

certainly very elegant. The plant is about 9 inches high, and bears eight gracefully arching leaves, about 6 or 7 inches long, and 1½ in diameter, dark green, and unequally bilobed. The arching raceme is about 9 inches long, and bears about thirty flowers of a light rosy shade, and from 1 to over 1½ inches long. Sepals and petals roundish-oblong, obtuse. Lip three-lobed; side-lobes falcate-oblong, rounded, or nearly truncate above, margin entire; front lobe much longer, broadly oblong; margins crenulate, apex somewhat bilobed. Spur decidedly longer than front lobe of lip, measuring about

FIG. 1.—JAPANESE HOUSE-GARDEN. (SEE P. 8.)

ound sufficient for the purpose. Sometimes as a result of this incessant torture all the branches die, leaving only the stump, in the shape of a thick shapeless stock, on which buds are grafted, so that from the same stock numerous different varieties—say of *Nandina domestica*—may issue.

The principles upon which these strange growths are produced are thus easily understood, while patience and perseverance in their application produce the desired results.

As curiosities and illustrations of vegetable physiology they are interesting, but they cannot, to our notions, be cited as illustrations of good gardening.

its longer, stouter, nearly straight spur, also in the flowers being rose-coloured, not pallid greenish-white. It was discovered in the Philippine Islands by M. Auguste Linden, who had the misfortune to lose his left leg by an accident during his travels, and after whom it is named, by request. The materials at hand are a coloured drawing of the entire plant, and a living raceme, said to have been taken from a much smaller plant, which had been sent to Ghent, and the flowers somewhat damaged. The drawing shows larger flowers and brighter colours than the living raceme, but I am assured it is a faithful representation of the species, and it is

three-quarters of an inch, nearly straight, and somewhat stout. It is proposed to publish a figure of the plant in an early number of the *Lindenia*. I may add that there appears to be a rose-coloured plant in gardens called *A. Roebleinii*; whether it is identical with the present species, I cannot say; but it certainly does not agree with the one originally described by Reichenbach. *R. A. Rolfe, Kew.*

CYPRIPEDIUM NIOME, n. hybr.

This is a new and very pretty hybrid, raised by Mr. Seden, of Messrs. J. Veitch & Sons' Nursery, Chelsea, between *C. Spicerianum* and *C. Fairriannum*, the

latter being the pollen parent. It was exhibited at the meeting of the Royal Horticultural Society on December 11 last, when it was awarded a first-class certificate. The flower has been sent to Kew by Messrs. Veitch, who informs me that the leaves are like those of *C. Fairriannum*, only a little broader, 3-5 inches long, $\frac{3}{4}$ -1 $\frac{1}{2}$ inches broad, and of a uniform green colour. The dorsal sepal has the shape and colour of that of *C. Spicerianum*, but in addition to the broad central band, there are numerous narrow purple nerves, which seem to me clearly to show the influence of the pollen parent. The petals are linear, oblong, and quite straight, whitish-green in colour, with about nine purple nerves, of which the central one is broader than the others, and all pass into rows of dots as they approach the base. The upper margin is beautifully undulate, the lower one less so and both are nearly ciliate, so that the influence of the pollen parent is seen to predominate somewhat in these organs. The lip, too, approaches that of *C. Fairriannum* rather than the other parent, it being small, whitish-green, and almost suffused in the front with light purple brown. Stamens sub-orbicular, a little indented in the front, margin whitish, the centre nerved with dark green, in front of which there is a suffusion of light purple. We have now three hybrids, whose pollen parent is *C. Fairriannum*, viz., *C. vexillarum*, *C. Arthurianum*, and the present one, and each of them are very elegant little plants. The seed from which *C. Niobe* was raised was sown in 1854. *R. A. Rolfe*.

FOREIGN CORRESPONDENCE.

HORTICULTURE IN BELGIUM IN 1880.

(FROM OUR SPECIAL BELGIAN CORRESPONDENT.)

HORTICULTURE continues to make progress here; commercial transactions, the introduction of new plants, the raising of seedlings, the publication of reviews and special treatises, the number of exhibitions, are all manifestations of increasing activity.

Exhibitions have been numerous during the year now closing. Their characteristic has been specialisation; and on Roses, Orchids, and Chrysanthemums, the efforts of the principal societies have in a large degree been centred.

The Chrysanthemum, which was somewhat depreciated three or four years ago, is to-day the fashionable flower with us. The public is seized with a somewhat exaggerated liking for this pretty Oriental flower which has been a favourite of the English for so long. It does not require that the amateur—for the Chrysanthemum is before all, in Belgium, an amateurs' plant—should possess costly accessories, or phenomenal fortunes.

We have not here the numerous winter gardens which exist in England, nor the wealth of our neighbours across the channel. With one or two rare exceptions, our amateurs are men of moderate means and modest pretensions; with this it is easy to understand the enthusiasm with which the "golden flower" has been welcomed in our small country.

The blooms which English horticulturists sent us had a decisive influence on our Chrysanthemum growers, who are striving now which shall approach the closest to the English standard.

The Chrysanthemum is not exactly a plant from which the nurseryman will realise great profits, but it has the advantage of creating amateurs, who will, pass on from the love of the Chrysanthemum to that of other plants, and will little by little reconstruct that brilliant phalanx of horticultural amateurs, of which Belgium was formerly so proud.

Orchids do not appear likely to lose the position which they have enjoyed for so long a time. Our nurserymen at the Paris Exhibition brilliantly maintained their reputation with choice collections sent to nearly all the temporary shows.

Our publications have given much prominence to charming introductions from the tropics, both in the text and in the form of coloured plates and cuts. At the meetings at Ghent and at Brussels, the chief

features were, among Orchids, some new introductions, many obtained by hybridisation.

Orchidists are very numerous, and nurserymen who have not, at least, a few specimens of Orchids are thinly scattered, and the *salons* where these fine flowers are not found are rare. A bouquet of natural flowers wherein Orchids are not included is no longer thought worthy of notice. Except for the great auction sales of Orchids which the English have established on the Continent, and especially in Belgium, there is no doubt that these flowers would never have crossed the threshold of the *salon*. These public sales, regarded at first with suspicion by our traders, have finally created an important branch of our commercial horticulture. They have had in our country a considerable influence on science, as we will hope to show some other time.

The increasing taste for flowers which has been manifested by the Belgian public has had its influence on the arts also. A couple of instances will prove this.

At the recent displays of Chrysanthemums at Antwerp, Ghent, and Brussels, especially in the first-named city, many artists showed works in which the Chrysanthemum was the chief object. Many of these pictures had a real artistic value. The tendency of our horticultural societies to attract the attention of artists strikes me as a happy one, as art may thus become the reporter of the progress of horticulture.

We have in Belgium many amateur photographers' societies, and among the members a tendency is growing, which I am happy to observe—it is the portrayal of the distinctive characters of particular flowers. At a recent photographic exhibition in Ghent, two exhibitors had excellent photographs of *Cypripedium*. Photography may be made of much service to horticulture by at once fixing the character of flowers which only endure a short time, and for that purpose it has the advantage over painting.

While speaking of pictures, I should like to mention that capital portraits of Chrysanthemums were executed for the Ghent show by an artist at Yokohama, Mr. Kumehara.

The Chrysanthemum fancy has also had its effect on the ceramic art. In place of the generally seen fantastic plants, we now see good representations of the Chrysanthemum.

FLORISTS' FLOWERS.

CHRYSANTHEMUM CULTURE AT THE ANTIPODES.

ONE of the latest Societies affiliated to the National Chrysanthemum Society is that of the Auckland Chrysanthemum, New Zealand. The culture of the favourite autumn flower appears to have taken considerable hold upon the florists there, and several of the medals of the National Chrysanthemum Society will be offered for competition at their next Exhibition at Auckland. It seems curious that their Chrysanthemum Show should take place in April, but that is an inevitable geographical difference.

The Auckland Society has just published, for the benefit of its members, a pamphlet giving directions for the culture of the Chrysanthemum, and hints on exhibiting it. It would appear that open air culture of this flower is much more common than with us in this country, and exhibition flowers are had from plants growing in the open. The soil in which they are grown is rich; it is highly manured and deeply stirred, so as better to retain moisture during the dry weather. The site selected for the bed is one sheltered from strong winds, but clear of the shade and roots of trees.

Culture in the Open Ground.—Cuttings are taken during October and the early part of November. Healthy root-suckers are also utilized for making plants, and bottom heat is not so generally employed in rooting them as with us, about the middle or end of November, just when our home grown plants are at the height of their bloom. The time for planting out appears to be a matter of great importance,

and stress is laid upon it, as the inclination of growers is to plant out too soon. In planting, it appears usual to place three plants of any one variety in the form of a triangle 6 or 8 inches apart, leaving about 3 feet between each triangle. When the young plants have become established and are making growth, the main stem of each is pinched back in order to induce lateral growths, and of these, the three most vigorous are chosen, the others being cut away; and in course of time they, in their turn, are stopped, leaving three buds upon each.

In reference to this second stopping, there appears to be some difference of opinion among the Auckland growers. Some do not adopt this plan, but allow the lateral buds on the three shoots obtained by the first stopping to break naturally. No stopping is done after January. At the point of each shoot flower-buds will be developed, and of these the centre or top bud is allowed to remain, unless imperfect from any cause. When these are securely set, all the other flower-buds and side-shoots are removed, and all the powers of the plants concentrated upon their expansion. The number of blooms permitted to each plant should not exceed nine, or at most twelve, and of these no two blooms are allowed upon the same shoot. Any shoots not required to carry blooms are removed.

From the first the young plants do not receive any check from want of water. The surface is well mulched in order to keep it moist and cool. The surface is kept loose to prevent it becoming hard and baked, care being taken not to disturb the roots. During dry weather frequent syringings are given, doing this in the evening, and copious root waterings are applied. Little or no liquid manure is administered until the flower-buds are set. Soot-water is preferred, for it is found one of the safest to use, as it helps to preserve the foliage, and imparts a dark green colour to it. But soot-water is applied with caution, and after using it for a week or so, it is discontinued for a fortnight or three weeks, when it is again applied.

Soot is sprinkled over the surface-soil in wet weather, but somewhat sparingly, and on no account is liquid manure applied in dry weather until a good soaking of water has been given to the plants. This is applied a little at a time, weak and often, and it is found to answer better than giving strong doses at longer intervals. From the time the flower-buds are set, until they begin to show signs of colouring, liquid manure is employed; then it is discontinued. From that time the plants must on no account be allowed to suffer for want of water. Each plant is secured to a stake, and when they are planted in triangles, the stake is at the back or outside of the plant.

CULTURE OF PLANTS IN POTS.

It would appear that the main portion of the blooms exhibited are taken from the plants grown in the open, but prizes are offered at the April exhibition for specimens in pots. Cuttings rooted by November are employed for the purpose, and when well established in 4-inch pots and growing freely, they are stopped, or pinched back, the effect being to cause lateral or side-shoots to be put forth. Five or six of the strongest of these are selected—such as are evenly distributed all round the plants, so as to form a good, shapely specimen, all the rest being removed. As they increase in length they are pegged or tied down so as to form a good bottom or framework, and are stopped in their turn. They are shifted on into larger pots as required, care being taken that there is no check through being pot-bound, for lack of water, or any other attention. They are shifted into 6-inch pots, and finally into 9 or 10-inch to bloom. Stopping is done as required, the aim of the cultivator being to form a good bushy and symmetrical specimen. After the plants are stopped, water is sparingly applied until the side-shoots make a good start; but on no account is the specimen permitted to suffer for want of water. The plants are kept tied out as required, only such stopping as is absolutely necessary is performed, and it is not resorted to after January. When the bloom-buds

appear, they are thinned out, the number left on a good-sized plant being from thirty to fifty. The plants are kept in a cool, airy situation out-of-doors, sheltered from strong winds, and where they will not be too much exposed to the effects of hot sun. Some place their plants in an open frame minus the lights, and half plant them in a suitable material. The Japanese varieties, owing to the difficulty experienced in training them, are regarded as the most unsuitable for forming specimens, but that experience is scarcely borne out in the Old Country, where some of the Japanese varieties are grown into admirable specimens.

ORCHID NOTES AND GLEANINGS.

LÆLIA GOULDIANA. VAR.

ONE of the most charming novelties that has come under our cognizance is Mr. Statter's form of *Lælia Gouldiana*. It appears that the plants originally came from Siebrecht & Wadley, New Rochelle, New York, who, by the way, were also fortunate enough in flowering a nearly pure white *Cattleya gigas*, Messrs. Sander, St. Albans, secured a portion of the stock, and from that firm Mr. Statter, Stand Hall, near Manchester, has acquired the five or six established plants in his possession, all of which are either showing flower, or in flower. This brilliant form under observation eclipses that figured in the *Orchid Album*, and as its inflorescence expands during the festive season, when both *Lælia* and *Cattleya* flowers are so scarce, it commands more than usual interest. It apparently is one of those hybrids that have sprung up in a state of nature, showing a large proportion of the blood of *Lælia autumnalis atrorubens* with some little *L. anceps*, and in fact something more which may not yet be known to commence, and the following is our diagnosis of it.*

Mr. Johnson, the gardener who grows this class more than commonly well, has the plant in question in a square teak basket, and judging by the maturing pseudo bulbs, which are on the increase in point of bulk, he fully understands the mode of cultivation demanded to ensure success. J. A.

VANDA KIMBALLIANA.

A charming species, with terete leaves and panicles of flowers, each measuring about 2 inches across, the segments ovate, lanceolate acute, white tipped with rose, the side lobes of the lip yellow, with small purple spots, the front lobes rich carmine. *Lindley*, t. 201.

OSCIDIUM CONCOLOR. *Lindley*, t. 205.

CYPRIPEDIUM ORPHANUM. *Rehder*, f.

A hybrid between *C. barbatum*, or an allied species, and *C. Druryi*. The editor protests against the appropriateness of the name as conveying a false impression. *Lindley*, t. 206.

DENDROBIUM CRUMENAEUM.

A south Chinese and Malayan species, with pseudo-bulbs dilated at the base, and with flowers disposed

* The pseudo bulbs are cono-cylindrical, about half the diameter of the true bulb, and somewhat more of those of *Lælia autumnalis*; petioles together, obsolete, slightly pinkish. The whole being a soft, indurible, suffusion of pinkish-purple, with lines shading with white. Upper portion of the labellum enveloping the column, soft shaded, with pinkish wings. The interior is singularly firm fat, and differing from those with which we have associated it, presenting, in having three very singular and very prominent hooked appendages of petioles together, obsolete, slightly pinkish. The lower portion of the labellum extends itself rather widely, and is of even a redder tint than the combed segments. Column 1 near, arching, oblong convex. In the concavity it is beautifully lined, and spotted with pink on a whitish ground.

in terminal racemose cymes. Each flower measures about 1½ inch in longest diameter, and is white in colour, flushed with rose or yellow in certain cases. The flowering of the plant is noted as taking place simultaneously over a large area. *Lindley*, t. 207.

GONGORA MACULATA.

A similar species, with drooping racemes of flowers, each about 2 inches in the long diameter, the segments deep yellow, spotted with reddish brown. *Lindley*, t. 208.

ANGREUM SESQUIPEDALE.

A healthy specimen of this white-flowered Orchid at Messrs. Seeger & Tropp's Nursery, East Dulwich, is now carrying ten blooms. The plant has a single stem at the foot, and bears three heads or growths of about equal size, and the flowers are large and have exceptionally long tails. On and about the rockery at this nursery were recently noticed varieties of *Lælia prestans*, *Ociscidium raniflorum*, *Epidendrum pallidiflorum*, *Ceologne Gardneriana*, *Cypripedium orphanum* × *C. javanicum-superbium*, *C. bellatulum*, *C. callosum*, and others, especially fine being a large specimen of *Vanda Sandiana*.

ROSES.

THE BEST TIME TO PLANT ROSES.

THE sooner after the semi-maturity of the wood the better for the Roses and all concerned. The old formula and hard-and-fast-line of the sooner after the fall of the leaf must be dropped, in these modern days when not a few Roses hardly shed their leaves at all, may not do so till February or March. The fact is, the disturbing effects of Tea, Bourbon, Chinese, and other blood has been so great among our Roses that growth is more or less perpetual among most of them, and the time of leaf-shedding extends over many months according to soils, sites, weather, and modes of culture.

As a rough guide, however, for amateurs and novices among Roses, it may be stated that the best time to plant all our hardest Teas, hybrid perennials, and the yet harder Moss, Provence, and climbing Roses is included within the six weeks from October 15 to November 30. The Rose leaves may be comparatively green, and the shootlets and branches far from a state of rest. But experience proves that there is something in that season, and more perhaps in the condition of the Roses at that particular time specially favourable to the restoration of suspended animation in the tops, and the prompt, almost spontaneous development of fresh roots. Now these two are really the prime factors in commanding success on the heels of planting, and hence the season that cuts down inaction alike in root and top to the narrowest limits must, of necessity, be the best; that a certain period of suspension of growth must follow transplantation, is a physical and vital necessity. But why the period should vary in length so greatly at different seasons of the year, and under different conditions of growth or maturity, has never been exhaustively nor satisfactorily explained. But the logic of facts is inexorable, and the foundation of our success in practice mostly consists in following their lead; whereas those who attempt to foist their fancies against the grain of natural facts are bound to fail. These causes at least work together during these six weeks to command success. There is a reserve of growing force in the plants, a reserve of summer or autumnal heat in the soil, and the conserving force of a moist atmosphere generally, would most correctly, as well as picturesquely, be designated a wet blanket. Some would find a fourth reason for success in the abnormal sensitiveness and activity of the roots at this particular season, and under their special vital conditions. But this may be included under the reserve of growing force, incident to this abnormally favourable season of planting.

It would almost seem as if this force were dormant unless waked up by root disturbance and trans-

plantation. As the processes of growth and maturity approach nearer to completion, vital force becomes more sluggish, and the roots take more time to gain a grip of the soil in their new quarters. This season a collection of old-fashioned Roses, planted on October 15, were re-rooted in their new quarters by the first week in November, and are now (December 23) the forwardest, most plump-budded Roses in the entire garden.

The respite of summer and autumnal warmth in the soil through October and November, also exerts a powerful influence in securing the disturbed and partly mutilated roots to a fresh start. Even a powerful reserve of growing force in the plants can hardly make much progress towards root growth, in a cold and semi-frozen medium; physical chills often prove more than a match for the energy of vital force. But when the two powers of abnormal warmth and vitality run in parallel lines or couples, a speedy and extraordinary development of root growth is the natural product or result of the two.

Especially is this the case when there is associated with an unusual manifestation of energy, an abnormal conservation of vital force. What practical men so forcibly designate a wet blanket, is a perfect antidote to the dissipation of the energy of vegetable life, and here, as in the domain of capital, a pound saved is a pound got. Possibly in both it is more and better than this, for the frictions and loss incident to the making another pound to make good the lost one is avoided.

Be this as it may, the moist earth and atmosphere, the rains, hoar frosts, fogs, the diluted light, the low temperature, all help to husband and accumulate, and not expend either vital sap or growing force. It is something very much to be thus enabled to preserve plants for days or weeks as they were without sensible loss, or tangible diminution of vital strength or capacity. It may also be logically inferred, that if there is no loss, there will be some real gain, and the gain will be in the direction of life. For in the state of suspended animation natural to plants immediately after transplantation, the tops enveloped in a wet blanket of moist air, can lose little or nothing. Their only outlet for force or energy is through the roots, and any effort put forth in these directions results in the formation of new roots. The moment these begin to move on towards the tops, the safety of the Rose or other plant is assured so far as any risks incident to transplantation is concerned, and all this is but the old axiom, perhaps a little more clearly, but far less tersely expressed, that plants sown before or in November we must succeed plants afterwards in May. D. T. F.

TRADE NOTICE.

Mr. ROBERT WALKER, formerly of the Pine-apple Nursery, Edgware Road; Minlre, Nash & Nash, Strand, W.C.; Clarke & Sons, Covent Garden; and the Lawson Seed and Nursery Co., Southwick, has commenced business on his own account, as seedsman and florist, at Church End, Finchley, London, N.

THE BULB GARDEN.

IXIAS.

ANYONE interested in gardening would welcome a handful of these beautiful flowers at any season of the year, notwithstanding which they are very rarely grown. In the matter of cultivation and cost, there is nothing to hinder anyone growing them, nor is there need for annual renewal of stock, as they naturally increase fast.

Ixias may be grown in pots to brighten the conservatory and greenhouse in late winter and spring and also in the open air on a south or south-west border, where they will furnish flowers in abundance. Although not so hardy as to be left in the ground from year to year unless under special treatment, they are sufficiently so that anyone interested may grow them if

if he has a frame to put over the bed, and sandy loam, about a fourth part of thoroughly decomposed manure, decayed leaf soil, and sharp sand in which to plant the bulbs. In pot culture, put half a dozen bulbs into a 48, and cover the bulbs with about one inch depth of soil, and successional batches of bulbs may be planted from October to the end of January. No attempt to force *Ixias* should be made, but a temperature of 40° or 45° should be regarded as the maximum; admit air freely whenever it is possible, and keep the plants near to the glass and in full light, or they will quickly become drawn. In the open air they may be planted in the months of December and January, and in warm localities even much earlier than the first month named.

By far the most satisfactory way to grow them is on a frame with *Tritonias* and *Babianas*, and the bulbs may be planted in October or November, and 4 or 5 inches deep, but later planted bulbs should not be buried more than 3 inches deep, always using plenty of sand round about the bulbs. For the open ground, a raised border of good rich soil is the best, planting them in December or January, 4 inches deep, and covering the bed with a similar depth of coconut fibre or leaf mould partly decayed, which may be removed in March. They are best when lifted annually in July or August, and dried thoroughly. In a cut state, *Ixia* flowers will last a fortnight, and are invaluable to those gardeners who must furnish large quantities of flowers. *J.*

THE APIARY.

THE NAUGHTY HYBRID.

I WILL venture to say, that had it not been for the offensive end of a bee, there would have been more failures in our business than we can now complain of, which is not a small number in some places. Almost everybody would keep bees, "just a few for their own use," were it not for their poisonous little darts. This is an established and well-known law in Nature which applies forcibly to the "naughty hybrid."

Had it not been for the fact that hybrids, between the black and Ligurian bees, are far more irascible than either of the races from which they sprang, these bees would long ago have been the bees of present agriculture. Now it seems a little peculiar that a fairly good-natured black bee, and a still better behaved Ligurian should produce offspring totally different to either race, but such is well known to be a fact. I have said before, that there are instances of bees crossed as above that are better tempered than either of their progenitors, but these instances are few and far between, like angel's visits.

In this short article, I shall endeavour to point out the reason for these two different conditions of affairs, and how I exchanged one for the other. I began my crossings from not only the best honey gatherers of each race, but also the best behaved, viz., the leather-coloured Ligurians, and also the blacks which possessed similar qualities. It has ever been my opinion that black bees, as a rule, are better tempered than Ligurians. The latter sometimes appear to be quiet, but just as you think how angelic they are going to be, they turn out very demons.

As a rule, when black bees sting, it will be found that it is not the bees that are in the hive that is being manipulated that sting—except a bee is pinched, in which case it is sure to sting—but the stings are from other bees darting about near the operator. On the other hand, Ligurians attack the operator from within the hive being operated upon, and often sting long before smoke could possibly be applied. Where hybrids have done so much mischief, and caused so many enemies, indiscriminate mixing has been the cause, but it seems to be capable of proof that if thoroughly pure and quiet bees of each race are taken and allowed to mix, good working bees will be the result. If now and then it turns out that you get a bad tempered set remove the queen, and put in one of a gentler race, and they will, of course, soon be got rid of. *Bee.*

PLANTS AND THEIR CULTURE.

THE GREENHOUSE.—Greenhouses should, at this time of year, be divided into cool, and less cool, many plants suffering if given the minimum temperature, viz., 45° to 50° day, and 5° to 7° night temperature. *Statices*, *Pimelea spectabilis*, double-flowered *Primulas*, *Pelargoniums* for winter blooming, require a warmth of 10° higher than these figures to grow well; it therefore becomes necessary to divide the plants if space can be afforded them, so as to give those which need it, the maximum temperatures. In some cases a small pit may be utilised for the purpose, and thus enable the gardener to give the cool greenhouse plants the treatment suitable to

in the house, and the pot should be often cleaned. *Tetrathecas* and *Leschenaultias* should be placed at the warmest part of the greenhouse, and where they will be untouched by cold-air draughts. *Boronias* and all other kinds of hard-wooded plants should be staked and tied out, but the fewest possible stakes should be employed. *Chorozemas* growing freely will require efficient watering, so as to get large blooms, and any training required by the plants should be done. Clay's fertiliser occasionally given, is good for *Chorozemas*. *Bouvardias* that bloomed early will now be past their best, and should be kept rather dry for a week or two, and then cut back, when they will furnish the cuttings for the next season. Good bushy stock in 7 and 8-inch pots may be obtained from these if propagation be done early. As soon as the stock of cuttings is secured, the old cut back

FIG. 2.—JAPANESE PINE TREE DWARFED BY ART. (SEE P. 8.)

them. Great care should be taken in watering *Ericas*, *Epacris*, and New Holland and Cape plants generally at this date, as these firmly potted subjects do not absorb much moisture during the foggy, sunless days. Rain-water should, where possible, be used, and it should be afforded in quantities sufficient to saturate the whole ball of earth, and if it is found that any plant is very dry at the root, the pot should be immersed in water and thoroughly soaked; or, if one part of the ball be dry, a basin should be formed with mould round that part, and water poured into it several times. Mildew will also be troublesome, and will spread rapidly if not checked at once. Abundance of air should be given day and night in mild weather, and when fire-heat is necessary to exclude hard frost, a small amount of ventilation will do no harm at the top of the house. Watering should be got over early in the day, so as to allow drainings from the pots to dry up before night. Decayed foliage should never be allowed to remain

plants may be thrown away, and last year's plants retained for planting out, as these are generally found large enough for most purposes. Succession plants which have been kept in a lower temperature will now furnish a supply of bloom if they are placed in a warmer house than that which they have occupied. *Solanums* may be similarly treated for an early supply of plants, cuttings being secured as early as possible, and the plants when rooted kept in small pots. Carnations must be kept free from aphids, and cuttings may be taken from old plants that are past their best; plants raised from these taking the place of the old stock.

Herbaceous *Calceolarias* should not be allowed to get pot-bound, and in shifting them more loam and less leaf-mould should always be employed; a few $\frac{1}{4}$ -inch bones or bone-dust should be added to the compost. If aphids be present on the plants, the latter should be dipped into weak tobacco-water a short time before shifting them. A few cuttings may now be

taken if the stock of the show and fancy *Pelargoniums* is low, and cuttings of them made from side-shoots which strike readily in bottom-heat, and make good plants for early autumn bloom. Some of the earliest *Fuchsias* should be pruned and placed in a warm house to furnish a supply of cuttings. Any *Fuchsias* struck late in the autumn should be shifted into larger pots, and be stopped regularly all over occasionally. The stock of *Chrysanthemums* should be examined, and any deficiencies made good, so as to be able to discard all the old stools, and thus give room for other plants. *Eupatoriums* coming into bloom will take plenty of water and weak liquid manure. *Saltias*, as they get past their best, should be headed down, placing them in a convenient place till cuttings are secured. The cuttings will do better if the old plants are not given too much heat. It is advisable to have young plants each season, and to propagate twice at an interval of two months or thereabouts. *Geo. Wyles, Spout House, Brentford.*

FRUITS UNDER GLASS.

THE EARLY PEACH-HOUSE.—The trees being now in bloom, every advantage should be taken of fine days to set the blossom, and for the purpose use a large cam-el-hair pencil in distributing the pollen, and go over the trees twice daily when the sun shines—at about noon, and at two o'clock. By treating the blooms in this manner, I have not had to complain of the loss of a crop of fruit; the pollen clings to the fine hairs of the pencil, and yet leaves them upon the slightest touch of the bloom operated upon. The brush, it may be stated, must be dry and clean. If the flowers are very thickly placed, it will be advisable to thin out the badly placed ones, that is those on the under sides of the branches, and any which may press against the wires of the trellis, these being in a bad position for swelling and colouring properly. In fine and mild weather every opportunity should be taken of giving air to assist the setting, and strengthen the blooms: shutting up the house with sun-heat early in the afternoon; a temperature of 60° at night, 55° to 60° by day, and 70° with sun and air may be maintained, the paths and wall-surfaces being sprinkled on fine days.

The *Second House* should be syringed twice a day, and kept at 45° to 50° at night, according to the state of the temperature outside, giving air by day, and shutting up with sun-heat early in the afternoon.

Later Houses should be got in readiness by cleaning, and tying the trees, and top-dressing the borders without further delay.

STRAWBERRIES.—As each forcing-house is put in readiness for starting, batches of early varieties of Strawberries to come on in succession may be introduced—a position on a shelf near the glass, where the plants are fully exposed to sunlight, being best for them. The temperature at first should range from 45° to 50°, and as the flowers open, fertilisation as with Peaches should be practised, and the temperature at this stage should be raised a few degrees. Keep the plants well watered, and before the blooms open, give them a fumigation with tobacco, should green-fly be present.

MELONS.—A small hotbed should be formed in the Melon-house and close to the glass, into this some small pots (60s) should be plunged, and two seeds sown in each pot—the weaker plant, when they germinate, to be pulled out. The young Melons will not require much water for some time, and when they do, pour it round the inside of the pot, and without wetting the stem. A good brisk heat will require to be kept up—say, 70° to 75° at night, and 10° higher by day. *W. Bennett, Rongore, Barton-on-Trent.*

THE KITCHEN GARDEN.

DIGGING.—At the present time the chief work consists of digging, trenching, and preparing all vacant plots for the crops of the coming season. If the ground is light, this work should be pushed forward as well as when it is heavy, so that it may become firm and solid before the seeds have to be sown. Heavy and wet soils are sometimes cultivated to better advantage if the digging be done in February, and then they should be turned up roughly. Trenches for Peas may, whenever possible, be got in

readiness. For the early crops of these vegetables, a distance of 6 feet from row to row is very suitable where the Peas are kept to themselves, and between them early Cauliflowers and Potatoes are planted, and the taller kinds stand 1 foot wider apart, and Spinach, saladings, early Turnips, are planted and sown. The trenches should be 14 inches wide and the same in depth, manure being wheeled in and placed at the bottom of the trenches when the soil is hard with frost. By due attention now and later in the matter of getting in readiness the land for crops, so far as may be done, labour will be saved at seed time.

Globe Artichokes.—See to the proper protection of these plants against frost, the long litter or Fern being placed closely round the old stem and above their roots. The Asparagus beds should be heavily coated with rich dung, but the alleys need not to be, or, at any rate, only very shallow, deep digging costing numerous roots destroyed in the work. Spread the manure, and make the sides good, that is all that will be required at this season.

Caneflowers and L. Stocks.—Plants in frames should receive air abundantly in fine weather, keeping the lights off, excepting when there is likelihood of sharp frosts. By doing this a sturdy growth is encouraged, and the premature turning in—buttoning—of the former will be prevented. Collect tree leaves to mix with manure for hotbeds. The materials must be well mixed and allowed to heat, when the heap should be turned outside in, and after heating has endured for a week, the hotbeds may be made up for early Carrots, Potatoes, Radishes, Lettuces, &c. Now is a good time to sow a little Parsley seed in a moderate heat, to be picked off and subsequently planted out when the spring comes in a sheltered part, or in a cold frame. *H. Marshall, Mereworth Castle, Maidstone.*

USEFUL MEMORANDA.

BOTANIC GARDENS, ETC., IN THE UNITED KINGDOM.

- BIRMINGHAM—Curator, W. B. Lutlam.

BOOKS.

A LIST OF ELEMENTARY AND REFERENCE BOOKS suitable for Garden Libraries, and useful for Young Gardeners and Amateurs to select from:—

GENERAL SUBJECTS.

Chemistry of the Fertil. By R. Warrington. (London: Bradbury, Agnew & Co., Bouvierie Street.)
Cultivated Plants, their Propagation and Improvement. By F. W. Burbidge, M.A. (W. Blackwood & Sons.)
Floriculture, Domestic, Window Gardening and Floral Decorations. By F. W. Burbidge, M.A. (W. Blackwood & Sons.)
Gardeners' Assistant. By R. Thompson. (Blackie & Son.)
Gardening, Epitome of. Moore and Masters. (Adam Black & Co.)
Theory of Horticulture. See Cassell's Popular Gardening, articles on "Life-History of Plants."

BEEES.

Beekeeping. By A. Rushbridge. (E. W. Allen.)
" By W. B. Webster. (Upcott Gill, 170, Strand.)

BOTANICAL.

Lessons in Elementary Botany. By Oliver. (Macmillan.)
Botany for Beginners. By M. T. Masters, F.R.S. (Bradbury, Agnew & Co.)
British Flora, Handbook of. By G. Bentham, F.R.S. (L. Reeve & Co.)
Elementary Course of Botany. Henfrey. Edited by M. T. Masters, F.R.S., and A. W. Bennett. 4th ed. (Van Voorst.)
Plant-Life. By M. T. Masters, F.R.S. (Bradbury, Agnew & Co.)
Students' Flora of the British Isles. By Sir J. D. Hooker. (Macmillan.)

COTTAGE AND AMATEUR-GARDENING.

Cottage Gardening. By E. Hobbday. (Macmillan.)
Garden Calendar. By T. W. Saunders. (Adams & Co.)
Paxton's Cottager's Calendar, price 3d. (41, Wellington Street, Strand.)

DICTIONARIES, &c.

Alpine Flowers. By W. Robinson. (Murray.)
Cassell's Popular Gardening, 4 vols. (Cassell & Co.)
Cottage Gardener's Dictionary. (Bell & Sons.)
Dictionary of English Plant Names. By J. Britten and R. Holland. (Trübner & Co.)
Dictionary of Gardening. Edited by G. Nicholson. (Upcott Gill, 170, Strand.) 4 vols.
Encyclopædia of Plants. By London. (Longmans.)
English Flower Garden. By W. Robinson. (Murray.)
Treasury of Botany. Edited by J. Lindley and T. Moore. 2 vols. (Longmans.)

DISEASES.

Diseases of Field and Garden Crops. By W. G. Smith. (London: Macmillan & Co.)
Diseases of Plants. By H. Marshall Ward. (Society for the Promotion of Christian Knowledge.)
Diseases of Timber. By H. M. Ward. (Macmillan.)

FORESTRY, TREES, &c.

Arboriculture. By J. Grigor. (Edinburgh: Edmonston & Douglas.)
Conifers, Manual of. (J. Veitch & Sons, Chelsea.)
Evergreens (Conifers), the Book of. By J. Hoopes. (Trübner & Co.)
Grafting and Budding. By C. Baltet. (London: Garden Office, 37, Southampton Street.)
Forestry, Practice of. By C. Y. Michie. (Blackwood & Sons.)
Hardy Trees, Shrubs, and Herbaceous Plants, Handbook of. By Decaisne, Naudin, and Hemsley. (Longmans, Green & Co.)
Larch, The. By C. Y. Michie. (Blackwood & Sons.)
Manual of Forestry. By Dr. Schlich. (Bradbury, Agnew, & Co., Bouvierie Street.)
The Forester. By J. Brown. (Edinburgh and London: W. Blackwood & Sons.)
Tree Pruning. Des Cars. (Rider & Sons.)
Willow, Cultivation of. By Sealing. (Kent & Co.)

FRUIT.

British Apples, Apple Congress Report. (Royal Horticultural Society.)
Fruit Book, the Hardy. 2 vols. By D. T. Fish. (London: Bazaar Office, 170, Strand.)

Fruit Culture under Glass, Handbook of. By D. Thompson. (Edinburgh and London: W. Blackwood & Sons.)
Fruit Farming for Profit. (G. Bunnard, Maidstone.)
Fruit Garden, the Miniature. By T. Rivers. (Longmans.)
Fruit Manual. By Dr. R. Hogg. (171, Fleet Street.)
Fruit Trees, Culture of. By M. De Breuil. (Lockwood & Co.)
Orchard House. By T. Rivers. (Longmans.)
Pear Congress Report. (Royal Horticultural Society.) (Macmillan.)
Pine-apple, Culture of the. By D. Thomson. (W. Blackwood & Sons.)
Profitable Fruit Growing. By J. Wright. (H. May, 171, Fleet Street, E.C.)
Strawberries. By W. Hinds. (Gardening World Office, 17, Catherine Street.)
Vines and Vine Culture. A. F. Barron, Sutton Court Road, Chiswick, W.

INSECTS.

Manual of Injurious Insects. By Miss E. A. Ormerod. (Swann, Sonnenschein & Co.)

LANDSCAPE GARDENING.

Carpet-Bedding at Hampton Court. By A. Graham. (Hampton Court.)
Gardens of Light and Shade. (Elliot Stock.)
How to Lay out a Garden. By E. Kemp. (Bradbury, Agnew, & Co.)

MANURES.

Artificial Manures. By M. G. Ville. Translated by W. Crookes. (Longmans, Green & Co.)
See articles on "Manures," in Cassell's Popular Gardening. By J. J. Willis.

PLANTS, FLOWERS, &c.

Begonia, The Tuberosa. Edited by B. Wynne. (Gardening World Office, 17, Catherine Street, W.C.)
Bulbs and Bulb Culture. 2 vols. By D. T. Fish. (London: Bazaar Office, 170, Strand.)
Cactaceous Plants. By L. Castle. (171, Fleet Street.)
Cactus Culture by Amateurs. By W. Watson. (London: L. Upcott Gill.)
Carnations and Picotees. By E. S. Doidwell. (Groombridge.)
Chrysanthemum, The. By F. W. Burbidge. (Garden Office, 37, Southampton Street, Strand.)
Chrysanthemum, Tint. By E. Molyneux. (171, Fleet Street.)
Chrysanthemum, National Society's Catalogue. (E. W. Allen, Ave Maria Lane.)
Cinchona Planter's Manual. By T. C. Owen. (Colombo: Ferguson; London: J. Haddon & Co., Bouvierie Street.)
Clematis as a Garden Flower, The. By Moore and Jackman. (Working Nursery, Surrey: Jackman & Son.)
Ferns, Choice British, &c. By C. T. Drury, Upcott Gill.)
Ferns, Select. (B. S. Williams, Holloway.)
Florists' Flowers, Hardy, their Cultivation and Management. J. Douglas.
Flower Garden, The Handbook of. By D. Thomson. (W. Blackwood & Sons.)
Gladiolus Cultivation. By Rev. H. H. D'Ombraim. (Reeve & Co.) [J. Murray.]
Greenhouse and Stove Plants. By T. Baines. (Greenhouse Management for Amateurs. By W. J. May. (Bazaar Office, 170, Strand, W.C.)
Hardy Herbaceous and Alpine Flowers, Handbook of. By W. Sutherland. (W. Blackwood & Sons.)
Ivy. By Shirley Hibberd. (E. W. Allen, Ave Maria Lane.) [Lynn.]
Lily of the Valley Culture. By T. Jannock, King's Lilies and their Culture. By Dr. Wallace. (New Plant and Bulb Co., Lion Walk, Colchester.)
Narcissus, the its History and Culture. By Burdidge and Baker. (Reeve & Co.)
Orchid Conference Reports. (Royal Horticultural Society.) [Wey.]
Orchid Growers' Manual. (B. S. Williams, Holloway.)
Orchidaceous Plants, Manual of. (J. Veitch & Sons, Chelsea.) [Windsor.]
Orchids, Cool. By F. W. Burbidge. (Chatto & Orchard, their Structure, History, and Culture. By L. Castle. (171, Fleet Street.)
Pansy, The, How to Grow. By J. Simkins. (Simpkin, Marshall & Co.)
Primula Conference Report. (Royal Horticultural Society.)
Rosarian's Year Book, The. (Bemrose.)
Rose Garden, The. By W. Paul, Waltham Cross.

Roses, List of National Society's Catalogue. By Rev. H. H. D'Ombraim, Westwell Vicarage, Ashford, Kent.
Rose Conference Report. (Royal Horticultural Society.)
Roses for Amateurs. By Rev. H. H. D'Ombraim. (Gill, 170, Strand.)
Tobacco Culture. By E. J. Beale. (Carter & Co., Holborn.)
Violet Culture. By Heath. (Burkett, Kendal.)

VEGETABLES, &c.

Asparagus, Culture of. By W. Earley. (Bradbury, Agnew, & Co.)
Cucumbers and Melons. By W. J. May. (170, Strand, W.C.)
Farm Market-gardening. By C. Whitehead. (Ellingham Wilson.)
Market Gardening. C. W. Shaw. (37, Southampton Street, W.C.)
Mushrooms for the Million. By J. Wright. (Journal of Horticulture Office, 171, Fleet Street, E.C.)
Potatoes, How to Grow. By J. Pank. (Lockwood & Co.)
Tomato. By W. Iggulden. (171, Fleet Street.)
Vegetable Conference Report. (Royal Horticultural Society.)
Vegetable Culture. By Sutton & Sons. (Hamilton, Adams, & Co.)
Vegetable and Fruit-farming. By C. Whitehead. (12, Hanover Square, London.)
Vegetable Garden. By Vilmorin, Andrieux & Co. (Murray.)
Watercress, Culture of. By Shirley Hibberd. (4 and 5, Ave Maria Lane, E.C.)

MISCELLANEOUS.

Buildings, Horticultural. By F. A. Fawkes. (Swann Sonnenschein & Co.)
Date Palm in India. By Bonavia. (Thacker & Co., Calcutta.)
Church Decoration. Bazaar Office, 170, Strand.
Garden Receipts. By Quin. (Macmillan.)
Parks and Gardens of London. By N. Cole. (Journal of Horticulture Office, 171, Fleet Street.)
Planting and Agricultural Review, Tropical. By J. Ferguson. (J. Haddon & Co. Bouvierie Street, E.C.)
Select Extra-Tropical Plants eligible for Industrial Culture. By Baron von Mueller (Melbourne: S. Bann.)
Sub-Tropical Cultivation. By R. C. Haldane. (Blackwood & Sons.)
Tropical Agriculture. By F. L. Simmonds. (Spon.)
Gardening in India. By G. M. Woodrow. (Trübner & Co.)
Coffee, Tea, Cinchona, Cacao, &c., see Planting and Agricultural Review. Ceylon. (London: J. Haddon & Co., Bouvierie Street.)
Tea. Cultivation of. &c. By Colonel Money. (Thacker & Co., Calcutta.)
Tea Planter's Manual. By T. C. Owen. Ceylon. (London: J. Haddon & Co., Bouvierie Street.)
Indiarubber Cultivation, &c. Ceylon. (J. Haddon & Co., Bouvierie Street.)
Tobacco, All About. (Ceylon, Ferguson; London, J. Haddon & Co., Bouvierie Street.)

GARDENING PERIODICALS.

1787—Botanical Magazine. Monthly. Editor, Sir J. D. Hooker. (L. Reeve & Co.)

COVENT GARDEN MEASURES.

MANY of these are purely local, and used only by those who frequent Covent Garden Market. They vary also in size, some according to the kind of fruit or vegetable they contain, and some according to the time of year and size of the articles they contain. It is, therefore, almost impossible to convey an accurate impression of these measures; but the following will be useful to those who are interested in Covent Garden quotations:—

A sieve is understood to be about 15 inches in diameter and 8 inches deep, and to contain 7 imperial gallons; half-sieve, 3½ gallons; quarter-sieve, 1½ gallon. A bushel basket is 17½ inches in diameter at top, 10 inches deep, and 10 inches in diameter at bottom. When heaped, it is supposed to contain an imperial bushel. Punnet: for Seakale, 8 inches in diameter at top, 7½ at bottom, and 2 inches deep; for Mushrooms, 7 inches in diameter and 1 inch deep; for salads, 5 inches in diameter and 1 inch deep.

A bunch of Radishes varies from one dozen to two dozen roots, according to the season.
 A bundle of Asparagus contains from 100 to 150 heads.
 A bundle of Rhubarb from 20 to 30 stems.
 A bunch of Carrots, 12 and upwards.
 A bunch of Turnips, 12 and upwards.
 A bunch of Leeks, 6 and upwards.
 Bunches of Greens and of herbs vary much, according to kind, size, and season.
 Roll of Celery = 6, 8, to 12 heads.
 A tally = five dozen.
 A score of Lettuce or Endive = 22.

LINDLEY LIBRARY.

This Library is held in trust for the Royal Horticultural Society, in whose rooms, 117, Victoria Street, Westminster, it is deposited. Under certain conditions it is open, and books may be lent, not only to the Fellows of the Society, but also to the general public. The Trustees are the Secretary and Treasurer of the Royal Horticultural Society for the time being, and the following gentlemen:—Dr. Robert Hogg, Dr. Maxwell Masters; W. Carruthers, Esq.; G. Maw, Esq.; and H. J. Veitch, Esq. Donations of books, &c., are solicited, the income at the disposal of the trustees being very limited.

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of to all events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communication should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, and sent as early in the week as possible.

NEWSPAPERS. — Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOW.

WEDNESDAY, JAN. 8. National Chrysanthemum Society (two days).

SALES.

MONDAY, JAN. 6. Dutch Bulbs, Tuberoses, and Lilies at Protheroe & Morris' Rooms.

WEDNESDAY, JAN. 8. Roses, Fruit Trees, Shrubs, Border Plants &c., at Stevens' Rooms (weather permitting). Lilies, Greenhouse Plants, &c., at Protheroe & Morris' Rooms.

THURSDAY, JAN. 9. 50,000 Lilium auratum, and other Imports from Japan, at Stevens' Rooms. Nursery Stock from Sample, at Protheroe & Morris' Rooms.

FRIDAY, JAN. 10. Established and Imported Orchids, at Protheroe & Morris' Rooms.

SATURDAY, JAN. 11. Roses, Fruit Trees, Shrubs, Border Plants, &c., at Stevens' Rooms (weather permitting).

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY THREE YEARS, AT CHISWICK.—36° 4.

A Gardener's Problem. WE have been favoured with an important communication from the Director of the Royal Gardens, Kew, on the conditions requisite for successful cultivation. Of this communication we give an instalment this week, and will give the remainder in our next issue.

In the *Kew Bulletin* for December is published a very important report on the tropical and sub-tropical plants actually cultivated in the open air in the South of Europe. It was drawn up at my request by Mr. WATSON, the Assistant Curator of the Royal Gardens, in order to preserve in a convenient form for future reference the actual results of his observations. I am persuaded that as regards the open air cultivation on the Mediterranean littoral of plants ordinarily grown in this country under glass, it affords by far the most accurate information available.

I preface this report with an introductory note, and inasmuch as the opening paragraph was the subject of some editorial criticism in the last number of the *Gardeners' Chronicle*, I reproduce it here:—“Horticulture is essentially an empirical art. Botanical science can afford but little information as to the cultural conditions which a plant will require or will tolerate; these for the most part can only be found out by trial or experience.” These state-

ments, I am told, are “too absolute.” It may be so; but, as they represent a deliberate and by no means hasty conviction on my part, I trust I may be allowed to discuss the matter at some little length, and to state my reasons for thinking the contrary.

The gardener's problem I take to be this: Given a new and interesting plant, with nothing but a more or less accurate indication—very possibly less—of its native country, how are you to treat it? I reply, that you have little but the instinctive skill of the gardener to help you. He will, in the first place, guided by general experience, form some sort of provisional theory of the treatment required; he will begin with that, because he must begin somewhere. He will be very probably miles from the mark, but, as presumably, he knows his business, he will soon detect, by careful observation of the plant, that he is upon the wrong tack, and will modify his treatment accordingly. Gradually feeling his way, he will eventually, if he has some genius for the kind of work, hit upon a method which will reward him by success.

Well, this is an entirely empirical way of proceeding; but it is none the less strictly scientific, for all that. It seems, however, such an elementary statement of what one sees going on every day as to be scarcely worth writing down. Take, for example, the case of the *Amorphophallus titanum*, which we flowered last summer at Kew. This was grown on in rather shallow pots never much larger than the tuber; it was fed richly, and during the period of growth the pot was placed with its bottom in the warm water of the Victoria-tank. Beccari, the discoverer of the plant, remarked how completely this treatment was at variance with the natural conditions under which the plant grew, but concluded, notwithstanding, that it was the best that could have been adopted. But what, it will be asked, is the alternative to the empirical way? It may be summed up, we are told, as a study of geographical distribution, and of the varying conditions of growth, of anatomical structure, and of the relations of structure to function and to external conditions.

As to geographical distribution, I have already pointed out that this is precisely what in the most interesting cases one does not know. That a plant comes from Brazil, for example, really teaches one nothing. The country is so vast, and it includes so great a range of physical conditions that, for all practical purposes, such a piece of information leaves one utterly in the dark.

But there is another point of view. Granted that everything is known as to the physical conditions under which a plant grows in the Tropics, is the gardener who attempts to grow it really much better off? How can the *totality* of such conditions—and from what may be called the scientific point of view, we have no right to give anything less—be imitated 6 miles from Hyde Park Corner, or, for that matter, anywhere in England? The problem really is to grow the plant under an entirely new and artificial set of conditions, and to produce a result not inferior to that which it exhibits under those which are natural to it.

We are here face to face with a biological problem of the greatest interest, and of no small difficulty. But in my judgment, it is only to be solved by empirical means. That the conditions of existence to the plant are really changed essentially when the plant is under cultivation, is indicated by two pieces of evidence. First, the notorious fact that it is extremely difficult in most cases to match exactly a cultivated speci-

men of a plant with wild specimens of the same species in the herbarium. And secondly, that it is equally notorious that cultivated plants are prone to variation. We have only to look to the often-quoted instance of the flora of Egypt, to see that under uniform conditions, variation is in abeyance, while we know that it is speedily stimulated by change of conditions.

I have in my mind the experience principally of cultivation under glass, but I believe that the principle equally applies to herbaceous plants grown in the open air. Let me quote a passage from Professor MICHAEL FOSTER's recently published lecture “On Irises.” He says:—“There are, it is true, more things in the plant and in the soil than are dreamt of in the latest philosophy of our newest botany, and in some happy gardens these Irises, will, I know, not only grow, but flourish and smile with content under conditions which must be wholly different from those obtaining in their native home, but which for some reasons, as yet hidden to us, are suited to the plants.”

This recalls to mind a principle, long ago pointed out by Dean Herbert:—“Plants,” he says, “in many cases are peculiar to those soils which are not best for them, but where they can exist. Why do plants,” he further asks, “which are found only in particular situations, improve under cultivation, and (as I believe to be the case) more so than those which are generally dispersed? and consequently, is the soil or subsoil on which alone certain plants are found in a wild state, necessary to them, or, at least, always best for them. I think the answer must be ‘No,’ to the latter question; and to the former question, ‘Because their most dangerous rivals, which, in a wild state, would overpower them, in richer soil are removed.’”

The fact is, plants in Nature do not grow where they like, but where they can. I well remember that one of the first lessons in horticulture I received was from the remarks by the elder JOHN SMITH, no mean practitioner, under tab. 4592 of the *Botanical Magazine*. I quote them now:—

“We are always most desirous to pay attention to information as regards the native habitats of plants; but we have found that when too closely adhered to, successful cultivation does not always follow. In our experience, we have never found any plant thrive by retaining it in its native soil, or in soil too closely resembling it.”

Here is a more recent testimony in the same direction. It is an extract from a letter written by Mr. BACKHOUSE, of York, to Sir JOSEPH HOOKER in 1853:—

“Many *Trichomanes* grow wild in much stronger soil than we can cultivate them in. The great depth of soil, free wind, and huge soakings (periodical) produce a total effect which we cannot imitate. I found many of the *Trichomanes crispum* group which had evidently grown in clay, or an almost clay soil, and I tried to imitate it exactly; but the Ferns never rooted in such material, and soon languished.”

Or, to take one of a hundred cases from practical experience: *Trichium Manglesii* enjoys(?) in Nature the most arid sun-burnt situations. At Kew it is grown successfully in strong, well-manured soil, and is never dried off.

Years ago, in ignorance of Dean HERBERT's paper, I made a brief communication to the British Association, in which I pointed out the curious fact that many plants grow equally well on the sea-shore and on high mountains, and I worked out a similar

explanation to that of Dean HERBERT. On the shore at Galway, I have seen *Gentiana verna* and *Dryas octopetala* growing with a luxuriance I have never seen surpassed on the Alps. It would be hard to say what there is in common between the two positions.

The fact is, not to put too fine a point upon it, Nature is at best a very poor gardener. The conditions under which plants exist in Nature afford very little real information for cultural purposes. They represent in a vast number of cases the minimum that the plant will tolerate,

at the Temple Show. These are the products of skilful cultivation; and, in my opinion, cultivation and Nature deal with problems which have scarcely anything in common."

(To be continued.)

VANDA CERULEA.—The Orchid collection of THOMAS STATTER, Esq., Stand Hall, Whitefield, is famous for the many choice plants which it contains, and recently there were about twenty specimens of the beautiful *Vanda cerulea* in flower, the number of flowers on each peduncle varying from eight to

the water that the plants receive. The plants have from one to three spikes of blossoms, and from ten to seventeen upon a spike. Our engraving was taken from a photograph by Mr. R. BANKS, Manchester.

NEW YEAR HONOURS.—We notice that the Queen has been pleased to approve the appointment of Sir John Lubbock, Bart., M.P., to be a member of her Majesty's Most Honourable Privy Council.

The Queen has also been pleased to approve that a Baronetcy of the United Kingdom should be conferred upon—J. T. D. Llewelyn, Esq., of Penllergare, and to confer the following distinctions:—

FIG. 3.—A GROUP OF VANDA CERULEA AND ADIANUM IN THE GARDEN OF THOMAS STATTER, ESQ., WHITEFIELD, MANCHESTER.

not the optimum at which it will display itself to the greatest advantage. Nothing surprised M. GLAZOU, in his recent visit to Kew, when he minutely inspected our collections of South American plants, more than their luxuriant development. He saw many species, he affirmed, as he had never seen them in their native homes. The same testimony is borne by other travellers. I believe we have Mr. BRUMMER's authority for the statement that *Phalenopsis* is never seen in the Bornean woods as it is seen in cultivation in England. And I am persuaded that this would be found equally true of the bulk of the fine specimens of Orchids exhibited for example

sixteen. Grouped with *Adiantum cuneatum* the plants presented a display of much beauty (see fig. 3). Mr. R. JOUSSON, the gardener, said in allusion to the plants, we have two dozen plants growing in a mixture of sphagnum moss and small lumps of charcoal. They are suspended from the roof of a house with a low span, in baskets varying in size from 5 to 10 inches. The house is kept during the growing season of the Vandas as damp as it is possible to keep it, and with a free current of air passing through it. Every morning each plant is taken down, sprinkled over with a sponge full of water, and replaced, and we find that sufficient water finds its way down the stem when hung up, to keep the sphagnum moss in a growing state, and this is all

To be Companions of the Most Eminent Order of the Indian Empire:—Berthold Ribbentrop, Esq., Inspector of Forests. Brigade-Surgeon George King, M.B., Bengal Medical Services, Superintendent of the Royal Botanical Gardens, Calcutta. To be Ordinary Member of the Most Distinguished Order of St. Michael and St. George, of the Second Class, or Knights Commanders of the said Most Distinguished Order: Cornelius Alfred Moloney, Esq., C.M.G., Governor and Commander-in-Chief of the Colony of Lagos.

To be Ordinary Member of the Third Class, or Companions of the Most Distinguished Order of St. Michael and St. George:—Oswald John Frederick Crawford, Esq., her Majesty's Consul at Oporto.

NEW GUINEA PLANTS.—Through the favour of Baron von MUELLER, we have received advance sheets containing the descriptions of the plants collected in the highlands of New Guinea by Sir WILLIAM MACGREGOR. The vegetation of the alpine heights in the Tropics is naturally of extreme interest to botanists, and hardly less so to horticulturists, who may fairly look for at least some novelties, more particularly at the lower elevations. Higher up, the conditions of alpine vegetation, even in the Tropics, are so similar to those met with in temperate alpine or in arctic regions, that there is a very considerable degree of uniformity of type in the vegetation: thus on the mountains of New Guinea, Baron Sir FERDINAND V. MUELLER tells us, may be found the Dandelion, *Taraxacum officinale*, *Aira caespitosa*, *Festuca ovina*, *Lycopodium clavatum*, *L. Selago*, *Hymenophyllum Tunbridgeense*, *Aspidium aculeatum*, all plants common on our Scottish or Welsh hills and elsewhere in Britain. Several new *Rhododendrons* are described, in connection with which the Baron reminds travellers unable to collect specimens or seeds for exportation, that they might collect the pollen and send it home to be used for hybridising purposes. We should prefer to pack it in soft dry paper rather than in oil-silk, which would favour the development of mould. New *Euparidis*, some suitable for cultivation, are described, and a new *Gentian* of interesting character. The *Conifers* include *Phyllocladus hypophylla* and *Libocedrus Papua*. The latter is a particularly interesting discovery, the distribution of the genus in California, Chili, New Zealand, Central China, and now in New Guinea, being very remarkable.

THE GARDENERS' ORPHAN FUND.—The last meeting of the committee for the year 1889, took place at the "Caledonian" Hotel, Adelphi, on December 27. George Deal, Esq., in the chair. The minutes of the last meeting were read by the Hon. Secretary, Mr. A. F. Barron. The following sums of money were announced: From Mr. G. M. Cummins, The Grange Gardens, Wallington, the sum of £1 19s.; and from Mr. Chapman, gr. to H. W. Robinson, Esq., Romford, 13s. from boxes at displays of *Chrysanthemums* open to the public. From Mr. R. Scott, Bradfield Gardens, Yorkshire, box in gardens and at *Chrysanthemum* show, £4 0s. 2d.; from Croydon *Chrysanthemum* Society donation, £1 1s.; from Isle of Thanet *Chrysanthemum* Society, per Mr. Miller, Local Secretary, 15s. 2d.; from Mitcham *Chrysanthemum* Society, per Mr. C. Gibson, Morden Park Gardens, 9s.; from Sevenoaks Gardeners' Mutual Improvement Society, per Mr. Soaring, £1; from Mr. H. Deverill, Seed Stores, Banbury, box in office, £3; from Young Gardeners, The Grove, Stanmore, fees to botany class, conducted gratuitously by Mr. J. Odell, £3; from Ancient Society of York Florists, floral service in one of the churches, and flower stall at the *Chrysanthemum* Show, per Mr. J. Lazenby, £10; and from Ealing Gardeners' Mutual Improvement Society, proceeds of a concert in aid of the Fund, £20 2s., with the request that Messrs. E. Chadwick, G. Cannon, E. Fountain, and A. Wright, be placed upon the list as Life Subscribers of £5 each, which was granted. A hearty vote of thanks was passed to all the foregoing. A letter was read from Mr. Gleeson, Clumber Park Gardens, stating that the net result of the recent concert at Worksop, including some private subscription, was £56, and it was the intention of the promoters to make the sum up to £60, and place upon the Fund for the space of six years a child from the district. A letter was read from Mr. Jas. Brown, The Gardens, Great Doods, Reigate, stating that the committee of the Reigate and District *Chrysanthemum* Society had voted the sum of £100—£50 to the Gardeners' Orphan Fund, and a similar sum to the Gardeners' Royal Benevolent Institution. A hearty vote of thanks was passed to the committee. Mr. Barron reported that the lessees of the Covent Garden Theatre had announced a ticket benefit in aid of the Fund, tickets to be obtained from Mr. A. F. Barron, that will admit to any morning or

evening performance between February 3 and 14, excepting Saturday. A cheque was drawn for the children's quarterly allowance, amounting to £61 15s. The proceedings closed with a vote of thanks to the chairman.

A HALL FOR HORTICULTURE.—Under this title "A Voice from Swanley," in characteristic tones, advocates the erection or acquisition of some building which the Royal Horticultural Society could call its own. Like our friend, we too hope to see the day when we shall have "a hall worthy of our great nation," and one which shall be available not only for the meetings of the Royal Horticultural Society, but of all the Special Societies, of the Library, of the Horticultural Club, of the charitable societies connected with horticulture. This has been a dream for many a long year, but when we see an enterprising firm of seedsmen and nurserymen sending the proposal broadcast with their Catalogue, we begin to hope the dream may be fulfilled. In the meantime, nurserymen and others would do well to advocate the claims of the Society with their clients, and endeavour to bring in a large accession of new Fellows. At the guinea rate, an enormous number of residents in suburban villas ought to come in.

A CONFERENCE OF CHRYSANTHEMUM GROWERS will be held at the Royal Aquarium, Westminster, on Wednesday next, in conjunction with the Midwinter exhibition of the National *Chrysanthemum* Society. The Conference will be held in the course of the afternoon, and the subjects for discussion include, "Are *Chrysanthemums* Wanted at Midwinter?" by Mr. J. KIRLING, of Knebworth.

THE LINNEAN SOCIETY met on December 19, Mr. J. G. BAKER, F.R.S., Vice-President, being in the chair. Messrs. S. A. MOORE and J. J. WALKER, R.N., were admitted, and Messrs. C. CURTIS and P. GROOM were elected Fellows of the Society. Professor P. M. DENCAN made some supplementary remarks on a specimen of *Hyalonema Sieboldii* which he had exhibited at a previous meeting. Mr. W. HATCHETT JACKSON exhibited and gave an account of an electric centipede (*Geophilus electricus*), detailing the circumstances under which he had found it at Oxford, and the result of experiments which he had made with the view of determining the nature and properties of a luminous fluid secreted by it. This, he found, could be separated from the insect, and could be communicated by it to every portion of its integument. Mr. J. E. HARTING pointed out that the observations made by Mr. W. HATCHETT JACKSON on this centipede had been long ago anticipated by Dr. MACARTNEY in an elaborate paper on "Luminous Insects," published in the *Philosophical Transactions* for 1810, vol. c. p. 277. A paper was then read by Mr. T. JOHNSON on "Dicytopteris," in which he gave an elaborate account of the life history of this brown seaweed, with remarks on the systematic position of the Dicytopteraceae. In the absence of the author, Mr. W. P. SLADE detailed the more important portions of a paper, by the Rev. JOHN GULICK, "On Intensive Segregation and Divergent Evolution in Land Mollusca," a paper which might be regarded as a continuation and amplification of the views which the same author had expressed in a former paper published in the Society's *Journal* last year (vol. xx., Zool., pp. 189 to 274).

ENGLISH VEGETABLES AND FLOWERS IN INDIA AND CEYLON.—The above is the title of a small book by Mr. D. McDONALD, dealing with the vegetables and flowers of the white residents in India, and which seems to comprise nearly everything of value in the way of vegetables for the table, and plants to decorate the flower garden. Many of the latter are silent reminders of home, and would seem to be ill at home in tropical India, but as the area of the country is as immense as its climatic conditions are very varied, there are places doubtless to be found

where the most unlikely plants will thrive with a due amount of care on the part of the gardener.

"THE ENTOMOLOGISTS' MONTHLY MAGAZINE."—A second series of this very serviceable publication begins with the January number. Its contents are varied and substantial, the typography clear, and no higher guarantee for the excellence of the editing can be wished than is afforded by the names of the six gentlemen by whom these duties are performed, viz., Messrs. BARRETT, DOUGLAS, FOWLER, McLAUGHAN, SAUNDERS, and H. T. STANTON. The preface to the last volume contains some details signed by Messrs. STANTON and McLAUGHAN, which will be read with interest.

"More than a quarter of a century has passed since (early in the spring of 1864) it was decided to establish the *Entomologists' Monthly Magazine*."

"The basis upon which it was established may be found in the preface to vol. i., in the first instance that it would be conducted without hope or desire of pecuniary gain on the part of its proprietors; and secondly, that it would be both popular and scientific. The latter idea has, we venture to think, been fully realised; as to the former, we can only say that no balance is in hand, and that when the financial results of more than twenty-five years' working can be adjusted, it is believed there will be no deficit."

"The two editors who took part in the inauguration of the Magazine in 1864, and who still remain on the staff, have no reason to regret the result of their endeavours to further, through its pages, the cause of entomology during the period that has since elapsed. Those of the editors who have joined at subsequent periods share this feeling."

"The fact of a Magazine devoted to entomology, conducted absolutely on non-commercial principles, existing for more than twenty-five years, is probably unique in the annals of Natural History journalism. The editors ask the present supporters to continue their aid, and to induce others to supplement it on the occasion of what will be practically a new departure, by their endeavours to further the sale of a journal which has been, and will continue to be, 'a labour of love.'"

"H. T. STANTON, | Two original Editors,
on behalf
"R. McLAUGHAN, | of their Colleagues."
"1, Paternoster Row, London, E.C., November, 1889."

THE LATE CLYDE DISASTER.—At the final meeting of the Committee held at offices of Messrs. Protheroe & Morris on December 20, Mr. H. J. Veitch presiding, Mr. Horsman, the Hon. Secretary, announced that the total receipts amounted to £433 3s., and it was unanimously resolved, 1st, that the subscription list be declared closed; 2nd, that the sum of £452 be equally divided between Mrs. Halland and Mrs. Fraser; 3rd, that the arrangements for investing the respective amounts be left in the hands of Mr. H. J. Veitch and Mr. Protheroe; and 4th, that as soon as the investment has been made a report be sent to all subscribers. Mr. Horsman was accorded a hearty vote of thanks for his services as Secretary, as were also the Editors of the various gardening papers, for their co-operation in giving publicity to the Committee's proceedings.

THE CARDIFF GARDENERS' MUTUAL IMPROVEMENT SOCIETY.—This body, Mr. F. BISHOP, Hon. Sec., informs us, will start its second session on January 7, when Mr. A. PRITCHARD, the President, will open the session with a paper on botany.

GURJUN OIL IN SKIN DISEASES.—Wood oil, Gurjun oil, or Gurjun balsam, which is obtained from several species in Dipterocarpaceae in India and the Indian Islands, is, it seems, being introduced into this country as the base of a new remedy for cutaneous affections. Its introduction appears to be based on the fact that Father DAMIEN used the oil in his leper cases, and had great faith in its efficacy. The balsam is principally obtained from the coast of Burma and the Straits of Malacca, by making

deep incisions in the trunks of the trees with an axe, from which the balsam flows. The principal species furnishing it are *Dipterocarpus alatus* and *D. turbinatus*.

B ROEHL.—The principal horticultural periodicals of Europe have applauded the idea of forming an international committee for the purpose of erecting a public monument to the indefatigable explorer BENEDICT ROEHL. The services rendered by this gardener-traveller to horticulture are widely appreciated; ROEHL'S chief merit was to have crossed without any support whatever, beyond that of his own sturdy resolve, some of the wildest tracts of America, and after sufferings beyond measure, to have brought to Europe treasures of previously unknown plants. This proposed monument is to be in Prague, not far from the place where he lies buried. Those who knew ROEHL, or who cultivate plants of his introduction, are requested to lend their support to the undertaking. Donors of not less than five Austrian florins will, we are informed, be presented with a portrait of ROEHL. We shall be happy to forward any contributions that may be sent to us for the purpose, to the Secretary of the Committee at Prague. The International Committee consist of representatives in England, Belgium, France, Germany, Austria, Russia and Switzerland.

BOUSSINGAULT.—It is proposed to erect, at the Conservatoire des Arts et M^{ét}iers, Paris, a statue to the great agricultural chemist, one of the first to test practically in the field the value for cultural purposes of the experiments made in the laboratory, and thus to apply the resources of science to the routine of practice.

EUCALYPTUS CITRIODORA OIL.—The distillation of Eucalyptus oils appears to be increasing in Queensland. It is stated in the *Chemist and Druggist* that a chemist in that Colony has recently erected plant for the distillation of the oil of Eucalyptus citriodora, the citron-scented Eucalypt, which grows extensively in the Port Curtis district. The still takes a charge of about 200 lb. and has a ton of leaves may be treated in one day, the product of oil amounting to a gallon.

A NEW WINTER CARNATION.—Our race of winter-flowering Carnations is made richer by a valuable sport from the well-known Souvenir de la Malmaison, which has been secured by M. LIXENES of the Soci^{été} Anonyme, Brussels, and named Madame Arthur Warocqué. We have the pink-coloured form of this variety already, and this new one is of a bright shade of scarlet. The plant grows but 12 inches high, is a sturdy grower, and is so profuse a flowerer, that bud-thinning would have to be practiced with it.

PRESENTATION.—On Thursday evening, December 19, at the Parish Schools of Sunningdale, Berks, a marble time-piece was presented to Mr. W. S. CAMPBELL, on his leaving Sunningdale, by the Rev. J. CREE, the Vicar, on behalf of a large circle of friends. Mr. CAMPBELL has filled the situation of gardener and bailiff at Coworth Park for several years, and his friends express the wish that he will again soon secure a suitable post.

THE MOST SUITABLE ORCHIDS FOR THE FLORIST.—In the United States of America, where the art of the bouquet-maker and floral decorator has taken great and rapid strides in recent years and bids fair to attain to still greater proportions, only forty-three species and hybrids of Orchids are found suitable for cutting purposes. According to their value in regard to usefulness, these are divided thus:—*Cattleya*, seven; *Cypripedium*, seven; *Dendrobium*, four; *Laelia*, five; *Odontoglossum*, five; *Oncidium*, seven; *Phalenopsis*, three; *Calanthe*, three; and *Cologyne*, two. The *Cattleyas* are regarded as the most graceful and beautiful, and bring the greatest profits, and the seven best are *C. Trianae*, *C. Percivaliana*, *C. Lawrenceana*, *C. Bowringiana*, *C. Gaskelliana*, *C. Mossie*, and *C. Mendli*. *Cypripediums* are not excelled in lasting powers by

Cattleyas, and it is to be regretted that numerous useful species and hybrids are still scarce and expensive, and on that account cannot be employed in bouquet work. Excellent are *C. Spicerianum*, *C. insigne*, *C. Harrisianum*, *C. Lawrenceana*, *C. villosum*, *C. Boxalli*, and *C. argus*. *Dendrobiums* have particular worth, seeing that their blooms can be obtained by skilful management at periods when other Orchid flowers are scarce. At the end of the year there are *D. Wardianum*, *D. nobile*, *D. Deari*, and *D. Jamesianum*. Amongst *Lelias* are the following: *Lelia purpurata*, *L. Perrini*, *L. anceps*, *L. autumnalis*, and *L. albidia*. Less extensive experience with *Odontoglossums* as to their commercial value has been collected; and the choice has fallen on *O. crispum*, *O. Pescatorei*, *O. citrosamum*, *O. grande*, and *O. Rossi majus*; a selection which nearly agrees with what we find in this country, where the cooler summer weather is more favourable to the cultivation of *Odontoglossums* than that of any part of the United States, except the mountain regions. The *Oncidium* family gives numerous species which flower freely and for long periods, and according to American observation the best have proved to be *O. varicosum*, *O. tigrinum*, *O. Jonesianum*, *O. sarcodes*, *O. Forbesi*, *O. Marshallianum*, *O. Cavendishianum*. The *Phalenopsis* are cultivated with more difficulty than the above-mentioned species, and the choice of the florists confines itself to *P. amabilis*, *P. Schilleriana* and *P. Stuartiana*. *Calanthes* grow with less attention at the hands of the cultivator, and their welcome blossoms appear during the months of December and three following months. The best species are *C. Veitchi*, *C. vestita*, and *C. v. oculata gigantea*. For sale and bouquet purposes the opinion is, that *Cologyne cristata* and *C. ocellata* are the best. The essential elements in American Orchid culture are separate culture for each species, and the consequential greater simplicity of the work.

LIST OF FAMOUS ORTICULTURISTS.—The following extract is from the *Journal of Botany for October and November* :—

"M'NAB, WILLIAM 1781—1848 : b. Daily, Ayrshire, 1780, d. Edinburgh, 1st Dec. 1848. Gardener at Kew from about 1800. Superintendent, Edinburgh Bot. Gard., 1819—1848. A.L.S. 1825. Pritz., 200; R.S.C. iv. 149; Gard. Chron., 1848, 812. Cott. Gard., i. 165, Proc. Linn. Soc. ii. 52; Bot. Gazette, i. 53. Portr. at Kew. *Macnabia*, Benth. (1832) = *Nalox*, Ledeb. (1831).

"MACRAE, JAMES (d. 1823—1850). Gardener. At Bot. Garden, St. Vincent's, 1823. Collected for Hort. Soc., 1821—1825, in Sandwich, Galapagos, and other islands, Chili, and Brazil. Superintendent, Ceylon Bot. Garden, 1827—1830. Lasgüe, 455; Trans. Hort. Soc., vi. p. 3. *Macraea*, Lindl. = *Triania*, *Macraea*, Hook. f. = *Lophota*, *Macraea*, Wight = *Phyllanthus*.

"MAIR, JAMES (c. 1775—1846) : b. Edinburgh?, circ. 1775; d. Chelsea, 1846. A.L.S., 1829, of Edinburgh. Collected in China, 1792—94. Afterwards employed by Hibbert. Edited Paxton's Horticultural Register, 1835—36. "Vegetable Physiology," 1833. "Popular Bot.," 1855. Account of Chinese Voyage in Paxton, Hort. Reg., 1836, 62, &c. Pätz., 291; Jacks., 577; R.S.C., iv. 192; Proc. Linn. Soc., i. 393.

"MANGLES, WILLIAM (d. 178—1805) : F.L.S., 1845. Nurseryman. Of Kensington. "Catalogue of Plants," 1778. *Manglesia*, &c.

"MANGLES, JAMES (d. 1809). Captain R.N. "Floral Calendar," 1839. Sent Swan River plants to Lindley. Pritz., 202; Jacks., 213. *Manglesia*, Endl."

"MANGLES, JAMES HENRY (1832—1884) : b. 1832; d. Haslemere, Surrey, 24th April, 1884, on of preceding. F.L.S., 1871. Grew Rhododendrons. Proc. Linn. Soc. 1883—86, 106.

"MANGLES, ROBERT (d. 1829). Brother of James Mangles. Of Sunninghill. Introduced many W. Australian plants. Sent Swan River plants to Lindley. *Manglesia*, Endl.

"MARTYN, JOHN (1699—1768) : b. London, 1699; d. Chelsea, 1768. F.L.S., 1727. Professor of Bot.,

Cambridge, 1733—1761. Friend of Dr. Sherard, 1719. Translated Tournefort's "History of pl. . . about Paris," 1720. Founded Bot. Soc., London, 1721—26. LECTURED in London, 1729. "Methodus pl. circa Cantabrigiam, 1727." "Historia pl. rarior," 1728—1732. Herbarium bequeathed to Cambridge Univ. Pult. II., 207; Rees; Pritz., 206; Jacks., 578; Memoir by Thomas Martyn, 1770; Gorham; Vol. of Correspondence in Bot. Dept., Brit. Mus. Martynia."

THE ST. LOUIS BOTANIC GARDEN.—This establishment is provided for under the will of Mr. HENRY SHAW. The whole of his estate, with the exception of a few small legacies, is now left to a board of trustees for the benefit of this garden. It has been appraised at nearly 3,000,000 dols., and produces a net income of about 500,000 dols.; but as a large part of Mr. SHAW'S property is invested in unimproved real estate within the city limits of St. Louis, the income of his estate may be expected to increase enormously with the growth of that city; and Professor WILLIAM TREBLESS, the newly appointed director, will, in all probability, says *Garden and Forest*, soon find himself at the head of a better endowed establishment than any other of its kind which has ever existed. Professor TREBLESS, with the income now at his command, or which will be available for his purpose in a short time, will be able to lay the foundation of an establishment of such scope that it will soon make St. Louis the botanical centre of the New World, and draw to it students from every quarter of the globe. His early efforts, very properly, will be devoted to elucidating the botany of North America; and he is fortunate in possessing, as a nucleus of the St. Louis herbarium the collections of ENGELMANN which, in certain groups of plants, are of inestimable value. Of special interest to young men who desire to become gardeners is the plan of offering, in connection with the Shaw Garden, six scholarships for garden pupils, for the benefit of young men between fourteen and twenty years of age, who are to be taken for six years, and who will be expected to work in the different departments of the garden, receiving, besides, theoretical instruction in botany, horticulture, economic entomology, and as much land surveying and bookkeeping as is necessary for a gardener having the charge of a large estate. It is proposed by means of these scholarships to make gardeners, and not botanists, and a taste for the manual work of the garden will be insisted on in the young men who hold them. They will receive pay for their work, and be given, free of cost, plain and comfortable lodgings near the garden, as well as free tuition in the School of Botany of Washington University, and such other instruction as may be necessary.

NOTICES OF BOOKS.

THE GARDEN'S STORY; OR, THE PLEASURES AND TRIALS OF AN AMATEUR GARDENER. By George Ellwanger. (Appleton & Co., Caxton House, Paternoster Square.)

Since the publication in our columns of the late Mr. Bright's "Year in a Lancashire Garden," we have had a succession of similar works—we cannot say a surfeit of them, for the subject is ever new, and admits of varied treatment, according to circumstances. Mr. Ellwanger writes from Rochester, New York, where the surroundings are vastly different from those in Lancashire, Buckinghamshire, or Middletham.

Mr. Ellwanger's chief design is to foster and encourage the culture of hardy plants, and his elegant little volume is appropriately inscribed to the Rev. C. Wulley Dod, "Master of Gardening." It is evident that the fullest allowance must be made for differences of taste, for after reading with approbation the judicious remarks on the pruning of shrubs, we lighted on this passage, which will, we think, not meet with general assent here. Probably the author

has been unfortunate in his selection of varieties " of the scores of Weigelas or Diervillas under cultivation." I know of few to be recommended for the choice collection of hardy shrubs. For the most part, the flowers are of a displeasing colour, while the shrub takes up a large space, which, with the " rose-coloured kinds, might be occupied to far better advantage." To this we may oppose our own experience, by saying that we have seen no more lovely flowering shrub than a particular Weigela in our own garden, with slender, somewhat arching branches, covered in most years with a profusion of the most exquisite rose-coloured flowers. Here is another point in which the author's experience is strikingly different from that which obtains on this side of the Atlantic. "*Helianthus tuberosus*, the Jerusalem Artichoke, shows a fine mass of yellow, far above one's head. . . In its habit, and the size and brilliancy of its blossoms, it surpasses *H. giganteus*. It comes late into blossom, and defies the frost." If the author did not expressly make mention of the tubers we should have suspected some mistake. In this country the flowers are rarely produced, and then only after specially hot summers, while it is among the earliest plants to feel the effects of frost. If the Jerusalem Artichoke flowers so freely in the States, will Mr. Ellwanger or some other enthusiast set about raising seedlings with the hope of improving the flavour of this esculent?

The whole tone of the book is delightful; it is full of practical hints, intermixed with so many artistic and poetical suggestions and reminiscences that it will form an excellent book to take up in a leisure moment to dispel the effects of the cares and worries of a busy life. We are sure that all lovers of their gardens will give assent to the following propositions:—

"I. Whatever is worth growing at all is worth growing well.

"II. Study soil and exposure, and cultivate no more space than can be maintained in perfect order.

"III. Plant thickly; it is easier and more profitable to raise flowers than weeds.

"IV. Avoid stiffness and exact balancing; garden vases and garden flowers need not necessarily be used in pairs.

"V. A flower is essentially feminine, and demands attention as the price of its smiles.

"VI. Let there be harmony and beauty of colour. Magenta in any form is a discord that should never jar.

"VII. In studying colour effects, do not overlook white as a foil; white is the lens of the gardener's eye.

"VIII. Think twice, and then still think, before placing a tree, shrub, or plant in position. Think thrice before removing a specimen tree.

"IX. Grow an abundance of flowers for cutting; the bees and butterflies are not entitled to all the spoils.

"X. Keep on good terms with your neighbour; you may wish a large garden favour of him some day.

"XI. Love a flower in advance, and plant something every year.

"XII. Show me a well-ordered garden, and I will show you a genial home."

L A E K E N.

The destruction, by fire, of the palace of the King of the Belgians at Laeken, near Brussels, will excite the sympathy and regret of the numerous British Horticulturalists who have experience of His Majesty's courtesy. King Leopold and his Queen are great plant lovers, the collections in the great conservatory at Laeken, of which we give illustrations (figs. 4 and 5), being under the charge of Mr. Knight, formerly the head gardener at Floors Castle.

MAY'S NORTHAM PRIZE BRUSSELS SPROUT is one of the best varieties of which I know. It sprouts firm, compact, but not over large, and, moreover, it is one which is very tender, well flavoured, and of good colour when boiled. *H. Markham*.

MARNOCK'S MAXIMS.

It would be instructive if some of the numerous admirers of the famous landscape gardener who has recently passed away would give us some account of the principles on which his achievements were based. His position for many years was a very distinguished one, and if it is correct that there is little sound knowledge of the principles of landscape gardening diffused among practical gardeners, it is all the more desirable that the records of a life-work of such duration should be published. Truly it must have been a natural gift that he so consummately cultivated, and a love of the beautiful, which became intensified by practice during an unusually long life.

In my youthful days, I had good reason to admire his sterling character while visiting the exhibitions held in the Royal Botanic Society's Gardens, Regent's Park, London, where he was at the time the Director; but it is not more than fourteen years ago since I came in close contact with him, and enjoyed exceptional opportunities of learning from his lips and pen what were some of his distinctive views with regard to parks and gardens landscape.

When I was invited to undertake the work of forming the new park and gardens at Impney, in Worcestershire, where an extensive pleasure garden in the French style had been commenced, but was to be removed to give place to a park and grounds in the English or natural style on a more extensive scale, I learned that Mr. Marnock had been there some time previously, and proposed a scheme which was, subsequently, only partly carried out, some of the best portions being cancelled. Mr. Marnock visited the scene of operations twice, and during a period of seven years I had much valued correspondence with him (now in my possession) which indicates the lines on which his very pleasing and attractive methods were based. But on ground like that at Impney, which had been mutilated by other hands with totally different ideas, it was not a simple matter to form a truly "English" park, and retain the best of the former work and add it to the new. Some of the operations which were popular with some people did not meet with encouragement from Mr. Marnock, and were to his refined tastes a great infliction. Reference to some of these which I have heard the great gardener denounce may be interesting and not unconstructive: "Formal lakes with long, meaningless curves, and studded with islands in the centre, were very offensive;" "rockwork of a mean, paltry character was intolerable, and anything artificial and insignificant in character was entirely ignored." Amongst other things which were not approved of by him were walks with many unnecessary windings, and whose crooks and bends were seen from the dwelling, his maxim being that no walk should be brought into view where it could be obscured.

"The dotting of trees and shrubs on lawns like sentinels, as a clever writer lately remarked, or placing anything on a lawn at all which in any way interrupted the view or defaced the space, was not allowed;" "the planting of trees in a meaningless way, especially when views were spoiled or obscured," was treated with disfavour. "The formation of terraces or other artificial work, where no building or anything else required such aid;" "cutting up open space for beds or borders, where a clean well-formed lawn would have enhanced the beauty of the demesne;" "abrupt slopes;" "planting in hollows;" "planting young trees besides old giants of the forest, or among them;" "covering up roots;" "covering up with soil gnarled surface-roots of old trees;" "forming beds for flowers or shrubs among or near old trees;" "buildings, such as walls for gardens, stables, &c., in view of, dwelling-houses;" "narrow strips of trees, especially if they shut out the adjacent country;" "plantations with jagged outlines, when they could be formed into substantial masses;" "trees planted at equal distances, showing the boundary of the park or domain;" "formal avenues, where they could be easily dispensed with;" "roads to the dwelling-house, taking long out-of-the-way turns, when

they could be concealed and the distance shortened," are some of the items which Mr. Marnock was strongly opposed to when the formation of parks or grounds were entrusted to him. Whatever appeared to be pleasing on paper, was accepted with caution until the levels and surroundings of the space to be manipulated on had careful inspection. Drainage and sanitary arrangements had primary consideration. He was a great admirer of cedars of Lebanon, and would say, when placing them in conspicuous positions, "They would monopolise the whole position a hundred years hence." When performing the duties associated with his profession, he made a long day's work. Once, when at Towyen in Wales, we started to mark trees and plan spaces for planting an old neglected park. The day's work was begun at daylight, and finished only as darkness set in. Rain was not a barrier to active work; and his memory seemed in full vigour when approaching 80 years of age. *M. Temple*.

TOMATOS.

The following summary is published in the *Bulletin of the Horticultural Experiment Station of the Cornell University, Ithaca, U.S.A.*—

1. Frequent transplanting of the young plant, and good tillage, are necessary to best results in Tomato culture.
2. Plants started under glass about ten weeks before transplanting into field gave fruits from a week to ten days earlier than those started two or three weeks later, while there was a much greater difference when the plants were started six weeks later. Productiveness was greatly increased by the early planting.
3. Liberal and even heavy manuring, during the present season, gave great increase in yield over no fertilising, although the common notion is quite to the contrary. Heavy manuring does not appear, therefore, to produce Vine at the expense of fruit.
4. The tests indicate that poor soil may tend to render fruits more angular.
5. Varieties of Tomatos run out, and ten years may perhaps be considered the average life of a variety.
6. The particular points at present in demand in Tomatos are these: regularity in shape, solidity, large size, productiveness of plant.
7. The ideal Tomato would probably conform closely to the following scale of points:—Vigour of plant, 5; earliness, 10; colour of fruit, 5; solidity of fruit, 20; shape of fruit, 20; size, 10; flavour, 5; cooking qualities, 5; productiveness, 20.
8. Solidity of fruit cannot be accurately measured either by weight or keeping qualities.
9. Cooking qualities appear to be largely individual rather than varietal characteristics.
10. The following varieties appear, from the season's work, to be among the best market Tomatos:—Ignomut, Beauty, Mikalo, Perfection, Favourite, Potato Leaf.
11. The following recent introductions appear to possess merits for market:—Bay State, Atlantic, Brandwine, Jubilee, Matchless, and perhaps Lorillard, Prelude and Salzer.
12. The following recent introductions are particularly valuable for amateur cultivation:—Dwarf Champion, Lorillard, Peach, Prelude.

TREES AND SHRUBS.

BERBERIS AQUIFOLIUM.

This plant varies considerably in the form and colour of its leaves, some being long, others short, and more or less prickly, and at this season of the year all the various forms are interesting, on account of the different tints of colour they exhibit, many being of a brilliant red colour, some of a bronzy red, and others of a deep dark green; but they are very showy in the shrubberies and other parts of the garden, the density of growth, which is natural to the plant, fits it for planting under high

FIG. 1. INTERIOR OF THE CONSERVATORY AT CRYSTAL PALACE, LONDON, 1851.

and shady trees, and in such places it makes a capital covering to the soil, where little else would thrive, except it be the common Laurel, Butcher's Broom and Pontic Rhododendron, but which do not flourish as does *Berberis aquifolium*. The plant bears close pruning annually, if dwarf growth is desired, and in our strong retentive soil it grows amazingly with large robust foliage, and produces its yellow panicles of flowers abundantly, if the pruning is not too hard. One way of causing a good effect is to plant this *Berberis* in clumps thickly together, and if a relief to the dull green of the leaves half the year is wished for, a few golden or silver leaved *Hollies* may be planted between or near these for the sake of contrast above. Manure added to the soil when planting is an advantage, the growth being all the more stronger for it. Although it is replanted with ease, it cannot bear long exposure of its roots to the air, especially if bare of soil, as is often the case when lifting them, the plants shrivelling in the leaf the following summer, and a whole year is required to restore them to health. A thin mulching of manure should follow the planting, and which will be of much value, especially if the following summer should prove a warm one. By pulling the plants to pieces, every bit with roots attached will grow, and in this manner a larger stock may be quickly obtained. N.

PRUNING LAURELS.

The present is a good time to set about the pruning and renovation of bushes of Laurel, which may have become untidy from loss of branches at the bottom, and where a thick covering of young growth is desired. Much better is it to cut very bare plants down to within one foot of the soil, than to lop off the tops by degrees, in the hopes of inducing the lower buds to push into growth. By a thorough pruning at once down to the point indicated, although a blank will be made at first, the time lost will be more than made-up by the increased vigour of the shoots, which will break thickly from the old stems. S.

COLONIAL NOTES.

GOVERNMENT CINCHONA PLANTATIONS AND CINCHONA FACTORY IN BENGAL FOR THE YEAR 1888-9.

ACCORDING to the annual report for the year 1888-9, the total number of Cinchona trees of all sorts on the plantations was 4,810,231, two-thirds of which are pure quinine yielders. The crop of the year, which was the largest ever harvested, amounted to 373,100 lb. of dry bark, of which 207,460 lb. were red, 128,770 lb. Ledgeriana, and 36,870 lb. of other sorts. The whole of this crop was, with the exception of a small quantity supplied on indent or sold to Government institutions, made over to the febrifuge factory for disposal.

The outturn from the factory, which is regulated by the demand, was 8375 lb. of which 2191 lb. were of sulphate of quinine, and 6384 lb. of Cinchona febrifuge. The total outturn for the previous year amounted to 7230 lb. The issues during the year fell from 8089 lb. in 1887-88 to 7489 lb. in the current year.

The decline in the issues is due to the extraordinary cheapness of quinine in the market caused by the development of Cinchona cultivation in Ceylon. It is anticipated that, as Cinchona gives place to Tea in the Ceylon plantations, the price of Cinchona products will again rise.

ROYAL BOTANIC GARDEN, CALCUTTA.

According to the annual report, during the year under report the Palm-house has been completed, and the continuation of the riverside road from Shalimar Point to the Garden commenced.

Some valuable additions have been made to the Herbarium, among which may be mentioned the collections from the Shan Hills, presented by General H. Collett, C.B., from the Naga Hills by

Mr. Peal, and from the eastern frontier districts by Mr. C. B. Clarke. Contributions were also received from the Kew and Perak Museums, the Straits Settlements, and Saharanpore, and specimens were sent to most of the leading botanic museums in Europe.

Dr. King has completed, during the year under report, the second part of his important work *Annals of the Royal Botanic Garden*, which deals with the genus *Ficus*, and is now engaged on the preparation of a new part on the Indo-Malayan species of Oaks and Chestnuts. These treatises, as they are completed, have been circulated to all the chief museums and botanical gardens in Europe and elsewhere, and are highly appreciated for their scientific value and accuracy.

HOME CORRESPONDENCE.

NARCISSUS BULBS IN CHINA.—*Appropos* of your illustration and remarks anent Mr. Jenkins' bulb of *Narcissus* planted topsy-turvy, kindly allow me to quote from Fortune's *Two Countries of China*, vol. i., p. 127, his observations and remarks on *Narcissus* culture in that "flowery land." "The common Jonquil," says Fortune, "too, comes in for a very extensive share of patronage; and in the streets of Canton one meets with thousands of bulbs growing in small pans, amongst water and a few white stones. In this case the Chinese exhibit their peculiar propensity for dwarf and monstrous growth by planting the bulbs upside down, and making the plants and flowers assume curious twisted forms which appear to be so agreeable to the eyes of a Chinaman." Although Fortune distinctly says the common Jonquil in the above description, yet I believe, he really referred to that form of *N. tazetta* so commonly cultivated by the Chinese and Japanese under the name of Sacred Lily, Joss Lily, or Water Fairy Flower, albeit that *N. Jonquilla* really is figured in Japanese florals as a native of Japan. The bulbs of this *Narcissus* have this season been imported direct by Messrs. Carter and Barr, so that water culture is likely to be a fact with us again as it is still in the East, and as it used to be in Europe fifty years or more ago. Nature is very amiable and accommodating, and of course bulbs—like many, if not most seeds—possess the power of righting matters for themselves if we blunder by sowing them wrong way up. In the case of some bulbs like *Lilium Brownii*, &c., I believe it is an advantage to plant the bulbs sideways, and the same is especially true in the open air culture of *L. auratum* and *L. speciosum*. F. W. Burbidge.

THE ROYAL HORTICULTURAL SOCIETY'S FLORAL COMMITTEE.—I entirely coincide with what Mr. C. Noble has said on p. 732, vol. vi. The appointment of an Orchid Committee consisting of members from the Floral Committee has not only robbed the latter of something like one half of those who make a point of attending the meetings, but it has sadly weakened the personnel by taking away from its deliberations a few persons of varied and extensive knowledge, whose presence is frequently indispensable when certain plants come before us. When fellows of the society look through the recently published proceedings of the committee, they, remembering that the Floral Committee is rather large in point of numbers, must be surprised to find that only six or seven persons voted for a first class certificate or an award of merit, under the date of June 25, 1889. Fellows may read that in the case of one particular flower, three voted for an award of merit and two against. For some reason or the other, the numbers who voted for or against the award of the Fruit Committee are not given in the proceedings; that doubtful advantage appears to apply only to the awards of the Floral Committee. If this practice is to be continued, I think it would be much better to give the names who vote for and against, and not merely the numbers. I am almost one of the oldest members of the Floral Committee in point of time, having joined that body twenty-two years ago, but I have not sat so continuously as some others. At that time the Fruit and Floral Committees were permanent bodies; and at the end of each year a number of the members who had attended least often were struck off, though this practice was manifestly unfair to some members who lived at a distance from London. The committee nominated others to fill their

places, and the Council, with very rare exceptions, affirmed the nominations of the committees. The time came when the practice began of disbanding the committees at the end of the year and of re-appointing them. From that time until the present day the members of the committees have been deprived of the privileges they formerly enjoyed, until they have become the mere nominees of the Council, and have to submit to a tax in order to sit upon one of the committees, and do the work of the Society without reward! The permanent character of the committees; the right to nominate to vacancies; the special ticket as a member of one of the committees; admission to special exhibitions like that of the Temple; the power of making awards without ostentatiously referring them to the council for confirmation; the usual luncheon on meeting days;—all these privileges have been withdrawn, until there is practically no independence left to the members of the committees. I am one who warmly protested against the appointment of an Orchid Committee by the Council, without in any way taking the Floral Committee into their confidence, as it would only have been courteous to have done. We see the special societies flourishing because their management is in more active sympathy with their supporters than is the Council of the Royal Horticultural Society with theirs. Nothing can go more smoothly than the proceedings of the Floral Committee of the National Chrysanthemum Society; it is appointed by the General Committee of that Society in open meeting, one-third of the body retiring annually, but being eligible for re-election. No harm can come from a little honest and outspoken criticism, and in writing what I have done, I think I am also expressing the opinions and feelings of a not inconsiderable number of members of the Floral Committee. R. Dean, *Editing*, W.

"JOURNAL OF THE ROYAL HORTICULTURAL SOCIETY."—Every one who has any knowledge of the subject must, I think, endorse your remarks as to the value of the *Journal of the Royal Horticultural Society*. It appears to me that the reconstruction of the Royal Horticultural Society occurred at rather a happy moment, just when, amongst other things, the great questions of fruit culture, gardeners' education, improvement societies, gardeners' libraries, &c., were coming to the front, thus opening out a vast and legitimate field for future energetic work and usefulness. The revived society already shows signs of settling down manfully to its work, and we may hope that it will long maintain its proper position as the great acting authority and head of the horticultural world. No doubt the renewal of the issue of the *Journal* is a step in the right direction. But while congratulating ourselves on the more punctual appearance of the *Journal*, ought we not to consider the means of rendering it a regular and permanent institution, conducted on a sound financial basis—a source of profit rather than of loss to the Society. If, as you say, the privileges accorded to each of the newly instituted class of quinea-fellows amounts to a money value of about 47s., it is pretty clear that the Society is giving more than it can permanently afford to do, and I take it that the cost of the production of the *Journal* is one of the items which helps to swell the expenditure. No one will, in my opinion, blame the Council for making an effort to popularise the Society. It is necessary and commendable, and everyone knows that it can only be accomplished by a free expenditure of capital; so that should we find this year a balance on the wrong side of the annual financial statement, I take it nobody will be surprised or chagrined, but will endeavour to assist and support the Council in the line of policy upon which they have now entered. Seeing that the *Journal* may fairly be designated as the vehicle of communication, not only between the Society and its Fellows, but also between it and the entire horticultural world, I submit that it should be put upon such a footing as to make it pay. The thing is how to do this. Now, it will not be denied that one of the weak points in connection with the present—and still more of the past issues—is the irregularity and uncertainty of publication. One hears it whispered on all sides that one never knew when to expect the next number, and consequently confidence was weakened, interest flagged, and indifference as to whether it was received or not was the result. With a view then to popularising the *Journal*, I would suggest: Firstly, that every effort should be made to maintain the present high standard of the papers and essays; secondly, that a properly qualified editor be appointed who

should be responsible for its regular appearance as a horticultural quarterly; thirdly, that in addition to being distributed to Fellows free, as at present, it should be procurable on the bookstalls and in book-sellers shops as other periodicals are; fourthly, that extracts from it should be issued in a cheap form, in numbers or essays, as say 3s., for the benefit of the hundred and one horticultural societies, gardeners' improvement societies, and gardeners' libraries (should the scheme take root) established throughout the kingdom. Published in the manner I have indicated, the *Journal* would probably command a large circulation, and become a valuable property. Much information would be widely disseminated, the influence and prestige of the Royal Horticultural Society would be increased, and a real benefit be conferred upon the masses as well as the classes. In any case, I hold regular publication at stated intervals to be absolutely essential to success. There is plenty of room for a publication of this sort, and as it would contain only the papers, essays, and proceedings of the Royal Horticultural Society, it would not interfere in any way with the work of the horticultural press. Of course, all this would take time and trouble—perhaps more than the Council and Scientific Committees could undertake; but this is only a question of proper organisation. *G. Deal.*

I wish to endorse the latter part of the letter signed "A. D." in the *Gardeners' Chronicle* for December 21, wherein it is suggested that the Society's *Journal* be made a monthly magazine. I believe if this suggestion were carried out it would be a great boon to the horticultural world; it would keep us well abreast of the times, would prove an admirable vehicle both for giving and obtaining advice, and would be, moreover, a medium through which the Fellows of the Society could conveniently approach the Council. *Charles Noble.*

THE JOSS (= DIOS) FLOWER: CHINESE "SACRED LILY," OR WATER FAIRY FLOWER.—Now that this peculiar variety of *Narcissus tazetta* (*N. tazetta* "gloriosa," Hort.) has been introduced by several of our leading bulb merchants, a few words as to its practical culture may be advisable. Having grown a fine specimen last season, which you kindly illustrated in these pages, what I know of its requirements may be useful to those who never saw the bulb before. My bulbs last season were totally immersed in water, and held firmly in position by small stones in an ordinary white bowl. They occupied a sunny window by day, and a table near the sitting-room fire at night, and my wife gave them fresh tepid water (65° Fahr.) every morning. There was no greenhouse or hot-house aid whatever in the matter, the heat and light of an ordinary sitting-room being amply sufficient for its culture. Their stems and leaves grew half an inch every twelve hours, and flowered at forty-two days from their first immersion, being then 21 inches in height. One bulb bore five spikes, and each spike bore from four to six white flowers with golden cups, the same being deliciously fragrant, and the plant formed a most delightful ornament, and it was much admired by our visitors, who had seen nothing like it before. This year the bulbs came earlier, and seen even more vigorous and promising than those of last season, and I will report progress later on when they flower. *F. W. B.*

STEPHANOTIS FRUIT.—An example of this fruit in the Museum here was produced this autumn by a plant in the gardens at Carron Lodge, the residence of the Hon. Mrs. Cheape, near St. Andrews. The same plant once bore fruit previously. No conscious aid was given in impregnation. *J. Wilson, D.Sc., University, St. Andrews, N.B.*

THE ELECTRIC LIGHT (A Correction).—In your issue of the 21st inst., you state, under the above heading, that the carbon of the Swan lamp "consists of the cortical fibres of the Bamboo." Is this not an error? I think the name "Edison" might be substituted for that of "Swan," seeing that the filaments of the lamps of the former are similar to what you describe. The wire-like thread or filament of the Swan lamp consists of "carbonised cotton thread," or, at least, such was the case a year or so ago. *J. H. N. C.*

THE WINTER MOTH.—The trap mentioned in your last number (p. 755) would be practically useless, because it would attract only male moths, the females being incapable of flight. Do what you will with insects, husbands will be found, if necessary; it is the would-be wives and mothers that require to

be trapped. I say, if necessary, because certain insects, and especially moths of which the female cannot fly, manage by a physiological process (known as "parthenogenesis," or "agamogenesis") to go on comfortably for many generations without finding a husband at all. All attempts at stamping out the winter moth should be directed to trapping the newly-emerged (and nearly wingless) females. I am not aware that the condition known as parthenogenesis has been proved to exist in the winter moth. In any case, it may be taken for granted that the capture of myriads of males would not have the slightest appreciable effect on the fertility of the untrapped females. *R. McLachlan, Louisville, December, 1889.*

CAREX VARIEGATA.—Where small elegant foliage is desired, this is a capital plant to grow. The leaves recurve, and its appearance is light and graceful. The leaves are green with a clear white central stripe running the lengthwise of the leaf. The propagation of this *Carex* is effected by division, each piece detached, if it have roots, will quickly begin to grow if placed in a moist place in the stove, and neat looking plants are soon obtained in 60s. A soil not over rich suits it, and if a large proportion of sand be mixed in it, the variegation is well preserved. *S.*

LAPAERIA HOUSE AT TRENTHAM.—The Lapaeria's at this noted place have been unusually beautiful this year. The flowers of all the varieties are such lovely, but perhaps the loveliest of all is the Trentham white variety, whose flowers are very large, of the purest white, and produced in the greatest profusion under fair conditions of culture. Many gardeners and others will remember the original plant in the old Obotogossium-house, and which still remains in its old quarters. The house under notice is the one more generally known as the Azalea-house; its roof is now entirely covered by four plants taken from the old one. An idea may be formed of the magnificent sight presented in September and October last, when, at the time of my visit (September 30), there were about 3000 fully expanded flowers hanging in graceful festoons from the roof, and hundreds of unopened buds to follow. The house is a beam-to, 64 foot long by 11 feet wide; the area thus covered is over 900 square feet, the roof being longer than the horizontal width of the house. Many who saw it—travellers who see most of the "good things" in the country—say they never saw anything to equal it before. *E. Gilman, Inspector Gardens, December 16.*

PLANT NAMES.—Many years ago I was a master at St. Columba's College, near Dublin. The pupils always wore Shamrock on St. Patrick's Day, and it was always the Black Medick. On last St. Patrick's Day, several Irish M.P.'s sent me sprigs of Shamrock. Once more they were in every case pieces of Black Medick. The authority for connecting with Mr. George London the transference of the name London Pride from the speckled Sweet William to the Kerry Saxifrage is given in Dr. Prior's book. *W. T.*

PRESERVATION OF CUT FLOWERS.—I think many of your readers would be glad to have a short article on this subject, giving the best method of preserving cut flowers until wanted. It frequently happens both to private gardeners and the florist that numbers of valuable blooms are wasted for want of this knowledge. For instance, after a few sunny days, a batch of *Eucharis* or forced *Roses* will open their blooms all at once; and if after using as many of them as are required at the time, the rest are allowed to remain on the plants, they quickly wither and die off; but if it were possible to gather and preserve them, it would be a great gain. I see in your notice of Mr. May's nursery you mention that the flowers are kept in cupboards, against a wall in a shed with a north aspect. I know a case in which choice flowers are kept for a week or more in good condition in an old chest of drawers, stood out of doors. Should the flowers be placed in vessels of water and stood in airtight drawers, or simply laid on damp moss, or what other material? Any hints on the best method of constructing a building specially for the purpose will be esteemed by—*A. Noote.*

GOLDEN PLOVERS.—I have just been looking over Mr. Johns' delightfully gossipy and charmingly illustrated book on *British Birds and their Haunts*, that I might find some information respecting the Golden Plover. Only the other day, December 21, hearing a shrill short whistle far aloft, I

looked up and saw a flock of these plovers making their customary voyage southwards. The whistle is so short and "shrieky," that once heard it cannot readily be forgotten. Apart from the passing note, however, the broad V-shaped form which the flight of the birds assumed, sufficed to indicate what birds they were. Mr. Johns devotes a couple of pages of descriptive matter to the Golden or Whistling Plover, which we see only in the winter, and even then usually only when the weather assumes a severe aspect. Old weather observers shake their heads and hold that the appearance of these birds signifies hard weather early. Mr. Johns mentions that these birds feed largely on earth worms, and in the moist cultivated lowlands which they frequent, it is their practice to tramp the soil as if for the purpose of alarming the earth worms and causing them to come to the surface, when they are caught, and eaten. When severe weather arrives, the birds, finding that it is not possible to capture worms, make their way southwards or to the muddy seashore, where the mud worms in any case are always plentiful. Mr. Johns says, "From their making their appearance in the rainy season, these birds have in France obtained the name of *pluiviers*, whence our name plovers, which however, is supposed to be given them for their indicating by their movements coming changes in the weather, in which respect, indeed, their skill is marvellous." Here we have at once the reason for the interest rural weather observers take in the movements of the plovers, for there is this belief widely prevalent that the coming southward in flocks signifies speedy hard weather. *A. D.*

THE SACRED LILY OF CHINA, NARCISSUS TAZETTA.—I noticed on p. 755, vol. vi., of the *Gardeners' Chronicle* some remarks on the rapidity of growth of this bulb, and it may be interesting to some persons to know how I fared with some bulbs which I obtained from a nursery on November 25. They were placed at once—some into gravel and water, and some into mould similar to that which is used for *Hyacinths* and, to my surprise, they were in bloom on Christmas Day, two blooms being fully open on the morning of that day, and in bud (December 30) nearly all the bulbs were in flower, and averaged six or seven spikes, with five flowers or flower-buds to a spike. The flowers are sweetly scented, and they have been grown in the stove, fully exposed to the light from first to last. *W. L.*

THE EARLINESS OF PRIMROSES.—Whilst engaged in planting about 3 miles from Penarth, and near the coast, I came across a Primrose in full bloom on December 27—a very rare occurrence here so early, or rather, so late in the season. *F. Bishop.*

HEAVY CLAY LAND. I noticed an answer in a recent number of the *Gardeners' Chronicle* to an inquiry respecting the cultivation of land of this nature. Having had sixteen years experience with oil of the description named, I should like to explain the treatment which I employed to bring it into a condition to produce excellent crops of vegetables. In the first instance the ground was thoroughly drained with 3-inch tile drains, over which a layer of rubble stone was placed. These drains were 7 yards apart and 4½ feet deep, and emptied into a 6-inch tile main drain, which conveyed the water to a neighbouring stream. In draining tenacious clay-land, it is advisable to cover the tiles with rubble or some similar material, to prevent the soil from clogging the joints. [In grass land, turf is used. *Ed.*] I remember when a boy, seeing in Sussex, in the draining of arable fields, small fagots of ling employed for this purpose, but for obvious reasons it would not be discreet to use this or anything of a woody nature in gardens. [Why?] The value of draining clay soils cannot be over estimated, and its advantages are so apparent, that no explanation is here needed. In trenching, potting refuse or garden rubbish, lime rubble, ashes, or the like material, should be worked into the soil, and we have never missed an opportunity of getting possession of these materials for employment in this manner, and to the manifest improvement to the garden. When practicable, I endeavour to trench the soil in autumn before it has become saturated with the rains, and my mode is that known as bastard-trenching, the bottom spit being turned over and broken but not brought to the top, and the surface is left level. All that is then necessary when sowing seeds upon such a plot is to level it with a rake, clear it of stones, draw the drills, and sow. The surface having become pulverised during winter, readily

FIG. 5.—THE CONSERVATORY AT LAEKEN. (SEE P. 20.)

yields to raking, and is an excellent bed for seeds. It is a mistake, I think, to attempt to dig over any piece of ground in spring which has been trenched in the autumn, as by doing so the pulverized surface is buried, and the soil which takes its place, and which has not been exposed to the elements for a considerable time, is not satisfactory for seed-sowing. It is also a mistake to make clay soils very fine, as when thus treated heavy rain forms a crust, which prevents many seedlings from pushing through it, and the result is often a poor crop. I used to cover all small seeds with prepared soil, a practice which answered admirably, but the land has now improved to such an extent as to make this practice unnecessary. The mode of cultivation known as ridding cannot be recommended for clay soils, and has the disadvantage of the furrows becoming saturated with moisture, which does not readily dry up until late in the spring, and makes a not very good seed-bed. I invariably dress the land that has been trenched with gas-lime, and when it is frozen sufficiently hard to carry a wheelbarrow, a wheelbarrow is given to each rod of ground, which is not only a useful fertiliser, but is destructive to slugs, the Onion maggot, wireworm, and other enemies to the kitchen gardener. In using ordinary lime, I prefer doing so in the spring or summer months, when it is the more beneficial to the land. With regard to manuring, large quantities of stable-litter are trenched in, much of it being fresh from the stables. Plots of ground treated in this manner are cropped with Peas, Scarlet Runners, and Dwarf Beans, the soil becoming consolidated before the seeds are sown; and the crops are usually excellent. For Cauliflower, Celery, and similar crops, the manure is, of course, used in a more decayed state. Onions, Carrots, Parsnips, Beet, &c., succeed late Peas and Beans, the ground being again trenched for them without, however, the addition of any manure. It is impossible for tillers of heavy clay soils to follow closely in the usual groove respecting the rotation of crops—for instance, I could not with any degree of success, let Onions succeed Celery, as the ground would not be properly prepared in time for sowing the seeds. *Thos. Chamber.*

NUTRITION & SEX.—In reference to Dr. Bonavia's note in your issue Dec. 21, I should like to say that it has long been observed that the sex of plants raised from the seeds of dioecious plants varies according as the soil is rich or poor, or as the seeds are sown thickly or thinly. Thickly sown, or starved, the proportion of male plants preponderates. Thinly sown, or well-fed, females predominate, and that this is also true of animals seems pretty well proven. But when once the sex is differentiated or decided, then an alternative course of feeding or semi-starvation seems necessary to induce the highest fertility, the females proving most fertile when under rather than over-fed; and the males *vice versa*. This point is alluded to by Virgil in his *Georgics*, and is of paramount importance both in the garden as well as on the farm. It has long been known that dioecious plants now and then alter their functions, those formerly males producing female flowers, or *vice versa*; and there now seems to be but little doubt but that altered conditions of nutriment be at the bottom of such changes, and even the ever-changing degree of fertility exhibited by our hermaphrodite dioecious trees is, no doubt, governed by climate—i.e., by heat, light, and moisture which regulate the supply of nutriment assimilated by such trees and plants. The intelligent gardener will, of course, always be on the alert to seize and utilise facts of this kind, but a well-directed series of experiments in a public garden would do much to put practice on a surer footing in the direction above indicated. *F. W. Partridge.*

ARRANGING BORDERS OF HERBACEOUS PLANTS. There is a considerable diversity of opinion on what is thought to be the most effective manner of carrying out this feature in a garden, each individual advocating his pet system as being the best. And where the individual only is concerned, then whatever may be the shortcomings of that plan, according to the views of others, so long as the individuals in question are satisfied that they derive the greatest amount of pleasure by following it, obviously in such cases it would be folly to interfere, as flowers are planted and gardens kept in order that they may be enjoyed by those who pay for them. However, the manner of planting and arrangement is generally entrusted to some other person, with, in all probability, no more instructions than that it is desirable to make those borders as

interesting and effective as possible. Now, the way in which this can be done best is a matter not so easily answered, as it must always, in a great measure, be influenced by the character of the place. Arrangements which might be suitable for one of almost unlimited extent might be altogether out of place under more restricted conditions. But in either case, whether large or small, it ought to be the object of the planter to dispose his plants in such a manner as to give the borders a well dressed appearance for as long a period as possible; and fortunately there is now such a wealth of fine material, that by judicious selection, there ought to be no great difficulty in maintaining a good display for at least two-thirds of the year. What I mean by a good display is, that the borders should present a floriferous appearance from end to end. Of course this style would not be compatible with the pet scheme of those who champion the planting of only one or two clumps of any particular subject, which style I would strongly advise intending planters to avoid, unless under special circumstances, which I shall never notice presently. It always occurs to me whenever I read or hear of any one advocating this style that they seem to forget that, owing to the widely different periods at which such plants flower, there would necessarily be comparatively little bloom on the borders at any one time, even if the clumps were extra large; indeed, this would make matters rather worse than better, as there would be correspondingly large blanks as the various subjects went over, and this in the case of early flowering subjects would, I maintain, be a serious defect during the best part of the season, without, so far as I can see, any corresponding advantage. Only imagine any moderately long border, say a couple of hundred yards, with only one clump of Snowdrops, Dutchbells, Delphinium, Peony, Pyrethrum, Phlox, Tulip, &c. I think there would be no gaining the fact that the effect would be miserably poor. Another fallacy in the argument of those one clump advocates is, they aver that a repetition of the same kind of plant becomes monotonous, if continued, as in bedding-out plants, I readily admit, this is so. But they overlook the fact that in the majority of herbaceous plants the flowering period is comparatively short, rarely more than a few weeks, and whether there be one or twenty clumps, they will come and succeed one another with the same regular monotony, if they chose to designate it such. But this ever-changing character is, I hold, one of the charms of a herbaceous border, indeed, if well planted, it ought to form a gradual sort of transformation picture right through the season. To accomplish this is no very difficult task, only sufficient numbers of one kind of plant must be used to give the necessary dominance for the time being, not necessarily all of one variety; on the contrary, as many varieties of the kind used should be included as can be comfortably accommodated, or sufficient to give the border for the time being, when in flower, a distinctive character, always of course taking care to make the clumps sufficiently large to be effective. I may mention a few of the subjects useful for this purpose, all of which are to be had in plenty—All the early flowering bulbs, Peonies, Delphiniums, Pyrethrums, Anemones, most of the hardy Primulaceae, Phloxes, Pentstemons, Hollyhocks, Rudbeckias, Gaillardias, Asters, Aquilegas, Dianthus, Antirrhinums, Hellebores, Daphnes, and some of the Campanulads, and many others equally suitable, which could be selected according to the fancy of the planter. Perhaps by this time it may be thought that there would not be much variety in such a border. But the arrangement suggested need not materially interfere with the number of species and varieties which the border would otherwise contain, as by judiciously planting the early and late flowering subjects next to each other, the former will generally either be cut in or gone down by the time the latter requires the space. Moreover in the case of bulbous or other plants which go down early, annuals should be sown in time to take their place—indeed, some of the showiest herbaceous borders which we have seen were a mixture of annuals and perennials, these together give a luxuriance and wealth of flower not obtainable by the line of perennials alone. Annuals also fill up the gaps of early-flowered things, thus preventing objectionable blanks sometimes seen in herbaceous borders; besides, the use of annuals admits of greater space being left between the permanent occupants, which gives greater facilities for cleaning—it may be manuring or forking between—when they are cleared off in the autumn. The one group of one variety system is all very well

and appropriate when a large space can be devoted to these plants, and a background of shrubs, where recesses can be formed for them in such a position, any individual species can be seen to advantage, as the shrubs will prevent the effect of those which are past, marring others which are coming on; but to adopt this plan on an isolated border, it has a very ragged and patchy look about it. Of course, introduce as many single clumps of individual species and varieties as the border will hold, as that gives interest to the border, but always plant sufficient numbers of salient things to keep up a continual change in the general appearance of the border. Where wide borders can be had—say from 15 to 20 feet—then a splendid effect may be made by thinly planting it with a selection of the best foliage and flowering shrubs and dwarf Conifers. This style is particularly applicable for public parks or large gardens, and also where comparatively narrow borders would be objectionable in winter. In all cases, whatever the method adopted, it is absolutely essential to success that the planter should have a thorough knowledge of the plants he is dealing with. *F. R.*

COOL FRAMES FOR VEGETABLES. To those who, like myself, have to keep up a constant and regular supply of vegetables in variety, and who have a late cold soil to contend with, a number of cool pits are of great service, particularly during the spring months, when the disadvantages of late soils are most felt. We are fortunate in possessing a large number of these pits, and in which early vegetables are produced in the following manner. Having command of large quantities of leaves, a portion of the pits were so constructed that a bed of five feet deep could be placed in them, and these keep a steady bottom heat for nearly twelve months, being subsequently useful for replenishing beds for Pineapples. As soon as the leaves, which are of Oak, are procurable, they are collected and firmly trodden into the pits, so that all the warmth they engender is utilized. For Potatoes, we put one foot of rich light soil on the leaves, and when it is warmed through, which is about the end of December—the sets previously sprouted are planted 4 inches deep and 1 foot apart. The after treatment consists in carefully ventilating the plants to keep them robust, and attending to the watering, a matter that requires a good deal of discretion, especially in the early stages of growth, when the vapour from the leaves will often keep the soil sufficiently moist, and too much water at that time affects both quality and weight of crop injuriously. To protect from frost, manure and litter are employed, care being taken that the points of the stems do not get frozen. The variety we grow is Veitch's Ashleaf Kidney. Carrots are an early vegetable are always liked, and are made up of by the cook even when very small. We formerly grew French Forcing for the earliest drawing, but have since substituted Early Nantes as being better. The beds for Carrots are prepared in the same way as the Potato beds. The soil is, however, worked to a finer tilth, and when wood-ashes are at command, some small quantity of these is added to it. The seeds are sown broadcast in the beginning of January, and lightly covered with soil, and the plants are thinned when large enough to handle to about 2 inches apart, and when drawing commences they are taken from the bed in a regular manner, in order to afford the remaining roots light and air. Turnips are treated in like manner, but the seed is sown at the end of January, and again at a later date, and they are thinned to about 6 inches apart. Early Milan is the best variety for pit culture, as it comes into use quickly, and keeps for a long time in useable condition. Rutabagas, for want of space, are sown thinly amongst the Potatoes, and are all drawn as soon as they are fit for use, so that as little injury as possible is done to the Potato crop. Cauliflowers.—The pits for these are shallow compared with those for the other crops, bottom-heat being unnecessary; nevertheless, a depth of about 1 foot of tree leaves is put into the pit to ensure good drainage, and upon this is laid a layer of short manure 3 inches deep, and covered with rich soil to the depth of 12 inches. The seed is sown at the end of August in a warm situation outside, and the plants when they have made four leaves are potted into large 60's, and afterwards planted out in January, at 15 inches between the plants. Air is admitted freely when the weather is fine; and when it is seen that the plants have made good roots, we assist them with liquid manure. Slugs are sometimes troublesome when the plants are young, but we rid ourselves of these

predators by hand-picking. It is remarkable how well Cashflowers do when treated in this manner, and the large number that may be grown in a small space, and the quality is perfect. The varieties we grow are Veitch's Early Forcing and Early London, the latter succeeding the former. Early Forcing is much the handsomer head, and a perfect model in its way. *Thomax Coulmer.*

THE ORCHID HOUSES.

PREPARATORY to the commencement of the general rejotting of all the Orchids requiring it, and which should be attended to in the first three months of the year, examination of all the necessary stores should be made to see that sufficient peat, sphagnum moss, clean crocks, pots, &c., are on hand, and if not, they should be immediately got in. Half-pots or deep pans are the best for most epiphytal Orchids, and especially those of low stature. An excellent quality of these, both for suspending by hangers, and for plants intended to be grown on the stages, are manufactured at the Wood Green Potteries, Waltham Cross. Teak-wood baskets are excellent for Orchids, and as many can be grown conveniently in them, or in suspended pans, should be so grown.

The temperatures for January should be:—warmest-house, 65° to 70° by day, 60° at night; intermediate-house, 60° to 65° by day, 55° at night, cool-house, 50° to 55° by day, 45° at night. *James G. Br.*

NAMING VEGETABLES.

THE Department of Agriculture at Washington has issued a report of the committee on the nomenclature of vegetables appointed at a meeting of the Experiment Station horticulturists, at Columbus, Ohio, in June last. The report and the rules which they offer are here presented:—

REPORT OF COMMITTEE.

The committee believe that all interests will be subserved, and that dignity will be secured by simplicity and good taste in the nomenclature of kitchen garden vegetables.

Reform in this department of horticultural nomenclature should be prosecuted as vigorously and successfully as it has been in the nomenclature of fruits at the hands of the American Pomological Society. The committee are confident that brevity, accuracy and good taste in the naming of vegetables are perfectly compatible with the purposes of trade, and therefore solicit co-operation in this work not only from all writers upon horticultural topics but from all dealers in garden seeds and supplies.

A name is bestowed upon any plant solely for the purpose of designating it; it is not the province of a name to describe the plant. All description is properly a part of the text. This description should present a characterisation of the variety, rather than a mere list of adjectives intended to catch the eye.

L. H. BAILEY, E. S. GOFF, W. J. GREEN.

RULES.

1. The name of a variety should consist of a single word, or at most, of two words. A phrase, descriptive or otherwise, is never allowable; as, *Pride of Italy*, *King of Mammoth*, *Earliest of All*.

2. The name should not be superlative or bombastic. In particular, all such epithets as *New*, *Large*, *Giant*, *Fine*, *Selected*, *Improved*, and the like should be omitted. If the grower or dealer has a superior stock of a variety, the fact should be stated in the description immediately after the name, rather than as a part of the name itself, as "*Trophy*, selected stock."

3. If a grower or dealer has procured a new select strain of a well-known variety, it shall be legitimate for him to use his own name in connection with the established name of the variety; as *Smith's Winningstadt*, *Jones Cardinal*.

4. When personal names are given to varieties, titles should be omitted, as *Major*, *General*, *Queen*.

5. The term *hybrid** should not be used, except in those rare instances in which the variety is known to be of hybrid origin.

6. The originator has the prior right to name the variety; but the oldest name which conforms to these rules should be adopted.

7. This committee reserve the right, in their own publications, to revise objectionable names in conformity with these rules.

THE WEATHER.

[By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees—i.e., "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S.
- Principal Grazing &c. Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

* A hybrid is the product of true species. There are few, if any, instances of true hybrids among common garden vegetables. The union of varieties gives rise to a cross.

THE PAST WEEK.

The following summary record of the weather for the week ending December 30, is furnished from the Meteorological Office:—

"The weather has been changeable and unsettled in the extreme west and north-western parts of the Kingdom, with rain at rather frequent intervals. Elsewhere the conditions have been quiet, and the rainfall very slight. In most districts, however, much mist, fog, and gloom have prevailed.

"The temperature has continued 2° or 3° above the mean in Ireland and Scotland, and has just equalled the normal in England, N.E., but in all the other English districts it has been below, the deficit having ranged from 2° to 4°. The highest of the maxima, which were recorded in most places on the 24th, varied from 50° in England, N.E., to 56° in Ireland, S. The lowest of the minima were generally registered on the 29th, when they ranged from 15° in the Midland Counties, and 17° in England, E., to between 20° and 25° in most other districts. In Ireland and the Channel Islands the minima varied from 30° to 33°.

"The rainfall has been less than the mean in all districts. Over the greater part of England the fall has been very slight.

"Bright sunshine has continued very deficient. The percentage of the possible amount of duration over the kingdom generally ranged from 2 to 18, but in England, S.W., 27 per cent. was recorded, and in the Channel Islands 30 per cent.

MARKETS.

COVENT GARDEN, January 2.

MARKET very quiet after the holidays. The supply of Grapes is becoming shorter, with prices tending upwards. *James Webber, Wholesale Apple Market.*

SEEDS.

LONDON: Jan. 1.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, write that the seed market to-day was dull and featureless. In the absence of business, slightly lower values are mentioned for red Clover seed; the majority of English samples now offering show poor quality. Trefoil, Alsike, and white Clover exhibit no material alteration. There is rather more inquiry for winter Tares. Blue Peas remain firm. Rape seed tends in sellers' favour. Bird seeds are now at a phenomenally low figure. Feeding linseed is neglected.

CORN.

Averages.—Official statement of the prices of British corn, imperial measure (quarter) for the week ended December 28, 1879.—Wheat, 23s. 10d.; Barley, 30s. 6d.; Oats, 18s. 2d. For the corresponding period in 1878.—Wheat, 30s. 7d.; Barley, 20s. 10d.; Oats, 16s. 3d.

FRUITS AND VEGETABLES.

SPITALFIELDS: Jan. 1.—Moderate supplies, with a rather slow demand, at following prices: English Apples, 3s. to 6s. per bushel; American Apples, 15s. to 20s. per barrel; forced Rhubarb, 1s. 6d. to 2s. per dozen bundles; Cabbages, 1s. to 1s. 6d. per tally; Savoy, 2s. to 3s. 6d.; Cauliflowers, 1s. 6d. to 2s. 6d. per dozen; Seakale, 1s. to 1s. 6d. per punnet; Parsnips, 1d. to 8d. per score; Spinach, 1s. 6d. to 2s. per bushel; Brussels Sprouts, 1s. 6d. to 2s. per half-sieve; Turnip-tops, 1s. to 2s. per sack; Sprouting Broccoli, 1s. to 1s. 6d. per score; Greens, 2s. to 3s. per dozen bunches; Turnips, 2s. to 2s. 6d. doz.; Parsley, 1s. 6d. to 2s. doz.; Horseradish, 1s. to 1s. 6d. per bundle; Celery, 4s. to 12s. per dozen bundles; Leeks, 1s. to 1s. 6d. per dozen; Endive, 1s. to 2s. doz.; Carrots, 1s. 6d. to 2s. per dozen bunches; Mustard and Cress, 1s. to 2s. per dozen baskets; English Onions, 7s. to 8s. per cwt.; Belgian Onions, 6s. to 6s. per bag of 110 lb.; Dutch Onions, 5s. 6d. to 6s. 6d. doz.; Spanish Onions, 6s. to 7s. per cwt.; Beetroots, 3d. to 4d. per dozen; Carrots, 1s. to 2s. per ton.

POTATOS.

BOROUGH AND SPITALFIELDS: Dec. 31.—Supplies are large, with increasing stocks, but the proportion of best qualities is not heavy, and these uphold their value, with a moderate trade. Inferior sorts, from absence of demand, are nominally unchanged. Quotations.—Regents, 40s. to 50s.; Hebrons, 40s. to 40s. 6d.; Magnums, 45s. to 50s.; Imperators, 40s. to 70s. per ton.

SPITALFIELDS: Jan. 1. Quotations: Magnums, 45s. to 60s.; Regents, 50s. to 65s.; Imperators, 50s. to 60s.; Hebrons, 50s. to 60s.; Early Rose, 40s. to 50s. per ton.

HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Prime Clover, 80s. to 100s.; inferior, 45s. to 75s.; prime meadowhay, 60s. to 125s.; inferior, 35s. to 60s.; and straw, 24s. to 40s. per load.

NOTICES TO CORRESPONDENTS.

Correspondents sending plants or fruit to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

AMERICAN GRASS: *Caroline C.* The grass plumes seen in the Manchester florists' shops are those of *Glycerium saccharoides* from Brazil.

ANEMONE: *W. M.* An attempt has been made to fertilise the flower in some way or another, the ovary has swollen up, and the flower segments

have become withered accordingly, just as happens when fertilisation occurs.

BORDEAUX MIXTURE: *A.* Take 6 lb. of sulphate of copper in powder, and dissolve them in 4 gallons of hot water. Mix 4 lb. of lime with 4 gallons of cold water. Add the two mixtures together, and add water, so as to make in all 20 gallons. Do not forget the poisonous nature of the solution, and exercise due care.

CATELEYA CHOCOMENSIS BUDS DAMAGED: *G. Stollery (Cherry).* This plant has a habit of behaving in the way described by you. The evil may sometimes be remedied by opening the point of the sheath. Too great a quantity of water at the root while the flower buds are pushing up, or too much atmospheric moisture in the house may cause such results.

CORRIGENDUM.—In Mr. Wythe's Calendar, Plants and their Culture, p. 751, read *Impatiens Sultanii*, and I. Hawkeri. The latter does not bear seed, and must be propagated by cuttings.—See *Mary's Nurseries*, Teddington, *Gardeners' Chronicle*, p. 721; for *Adiantum Capillus-veneris* read *Adiantum cucullatum*.

FUNGUS: *J. C.* The fungus sent is the mature state of the dry rot. A short practical article on the subject you mention would be acceptable. Many thanks for suggesting it.

GRAFTING PLUMS AND APRICOTS: *A. P.* It is practised in nurseries, when it is desired to raise stock without delay, but it is fast giving way, as a general practice, to budding, which entails fewer losses, and makes a neater union. Apricots break early, and should be worked on the free-growing Brompton or Mussel Plum-stock before the Apples and Pears are touched. The last year's shoots for grafts are better when taken in mid-winter, and laid-in in soil in a cold place till wanted. Plums would follow the Apricots a little later; and grafting should be done just when the sap is beginning to move. Budding is usually done with nearly matured buds in August and September, but with care, and the use of a little grafting wax, it should succeed in the spring.

JASMINE OLEIFLORUM GRANDIFLORUM: *W. H. T.* We have not previously heard of this plant fruiting out-of-doors, but we have occasionally seen fruits of the common variety.

LONDON PRIZE: *A.* This is an arsenite of copper, and is used in the proportion of 1 lb. to 300 gallons of water. Try a small portion first, as the solution is very poisonous to vegetable as well as to animal life. After using it, wash the plants well with clear water.

MUSCAT OF ALEXANDRIA AND BLACK HAMBURG VINES: *A. O. B.* These are sometimes grown together in the same house, but never very satisfactorily, unless there be one end of the viney which is much warmer than the other, as will occur when the boiler is partly placed under the floor, or there is a collection of hot-water-pipes at that point, and about this part of the viney Muscat Vines will bring very fair bunches. If your Blackland Sweetwater is in such a position, it may be replaced by a Muscat with a fair prospect of your being enabled to cut ripe fruit in August, if the house is started early in February. The treatment should be intermediate between that required for a Black Hamburg and a Muscat of Alexandria, and even then the former will be dead ripe sometime before the latter begins to colour, and must be eaten, or cut and preserved in the Grape-room.

NAMES OF PLANTS: *E. G. Boulleau*, *Epidendrum ciliale*.

YOUNG GARDENERS' STATUS: *A Reader.* An improver is usually a journeyman who goes from place to place with the idea of acquiring a fuller knowledge of his business. Are there young journeymen who have not that laudable ambition? If there are, we should say that it were better to class them as garden labourers. The term improver is a misnomer, and should be dropped. Apprentice, student, or learner—one whose aim is to master the rudiments of gardening—would be better.

J. C. WHEATLEY & SON, Gloucester—Select Seed List.

DIED.—THOS. FREEMAN, for nineteen years gardener at Honington Hall, Warwickshire, and twenty-two years gardener to Lady Cotton, Shepherds, Crakmarsh Hall, near Uttoxeter, died at Uttoxeter, Staffordshire, December 26, 1878, aged seventy-one. Mr. Freeman was well-known as a practical, all-round gardener, and was very highly respected by all who knew him. He leaves a widow, aged seventy-five, to mourn his loss, also a grown-up family.

ENQUIRIES.

Helianthus annuus and *Helianthus scaberrimus* BAYON.

TUBEROSES.—Will any of our correspondents kindly tell *A. P.* if *Tuberoses*, *Polyanthus tuberosa*, will bloom satisfactorily a second time?

CHANGES PRODUCED IN *LYCHNIS VESPERTINA* BY A PARASITIC FUNGUS.—MESSRS. MAGNIN and GAUD describe the remarkable changes produced in the flower of the common wild white Campion by the attacks of a parasitic fungus, *Ustilago anthorum*. *Lychnis vespertina* is dioecious, and the male and female plants are essentially different forms, differing not only in the presence or absence of the male and female organs respectively, but also in the size of the flower (those of the male plants being smaller), the venation of the calyx, &c. Hermaphroditic individuals sometimes occur, but are simply female plants in which stamens are produced by the presence of *Ustilago anthorum*. This fungus can develop its spores only within the anthers of a flowering plant. In such plants of *Lychnis vespertina* its only visible outward effect is a slight deformation of the anthers and shortening of the filament. In the female plant it brings about (1) the production of stamens; (2) atrophy of the style and of the upper part of the ovary; (3) a greater or less elongation of the internode between calyx and corolla, this being also characteristic of the male plant. It also frequently causes tetramerism or pentamerism of the flowers, lobing of the margin of the petals, and a change in the venation of the sepals. This observation corresponds to those made by Miss BEBB, Mr. PROVANCHER, and others.

GARSDIDE'S SILVER SAND

BEDFORDSHIRE
COARSE AND FINE

Is admitted by the leading Nurserymen to be the Best

Quality obtainable in the Trade. Customers should Buy Direct from the Owner of these Celebrated and Extensive Beds, which contain a practically inexhaustible supply of Splendid Sand, and thus save half the ordinary cost. NO TRAVELLERS OR AGENTS.

Apply direct to the Proprietor for Samples and Price List on Rail or Canal. All Orders executed with the utmost promptness and under personal supervision. Special Railway Rates in force for all parts. All kinds of PEAT supplied at the lowest possible prices. Sample Box sent on application to GEO. GARSDIDE, Junr., F.R.E.S., Leighton Buzzard, Beds.

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Aclty Bug, Brown and White Scale, Weevils, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, Jy 15, 1887.—Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1oz. to a gallon of water at a temperature of 95°, I had it kills Green Fly immediately. Double this strength, or 2oz. to a gallon at 100°, sends the fate of Scale of all sorts in a few seconds; while 2oz. to a gallon at same temperature effectually dissolves Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to use, and all our insect remedies applied through common syringe, or garden engine, a much severer test of efficiency than when applied by hand washing or spray. I remain, dear Sirs, yours truly. (Signed) A. MACKENZIE, of Messrs. Methven & Sons, Victoria and Paradise Nurseries, Upper Holloway, London, January 1, 1888. "GENTLEMEN—I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effective in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale." (Signed) B. S. WILLIAMS.

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins of 1 and 2 gallons, 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS and SON, 157, Queen Victoria Street, London.

TOBACCO PAPER, best quality, 8d. per lb.; 14 lb., 9s.; do. FIBRE, much stronger and better, 9d. per lb., 14 lb., 10s. 2s. lb. carriage paid to any station. Large reduction to the Trade.

PERCE and CO., St. Andrew's, Bristol.

"Nothing Succeeds like Success."

ESTABLISHED HALF A CENTURY.

THE ILLUSTRATED CATALOGUE OF FRESH AND SELF-GROWN SEEDS.

English Edition is now ready, and may be had Post-free on application. Ad. Post-card.

My Business is the Oldest and Largest of Erfurt, and supplies private Gardeners and Amateurs only; its extensiveness and perpetual quality, apart from testimonials, speaks for its reliability.

More than 60,000 parcels are sent yearly to all parts of the World. I offer my Seeds at much lower prices than any English or Continental Seed House of good repute, and guarantee besides Silver Spruce, guano, and fresh Seeds only, grown under my personal supervision. It is an established fact, that the greater part of all seeds sold in England or America is grown in Germany, especially in and near Erfurt, the Garden-Town of Germany.

Everybody should buy, therefore, direct from the Grower in Erfurt. Save money, and get the most reliable value.

The fashion of most Seed Houses is to advertise by presenting a Catalogue, printed and covered in the most expensive and luxurious style, ornamented with gold and silver.

Who pays for this? The buying public! Compare these Catalogues' prices, please, with mine, and you will see the difference yourself!

My Catalogue is not so profusely ornamented, but it contains a most complete and well-colored List of the best Vegetables and prettiest Flowers, including all the latest Varieties of the Season, so arranged that every body, with the greatest facility, can make their own selection, simply stating the number corresponding with the Catalogue. Purchasers of Seeds in large or small quantities cannot fail to see the advantages I offer.

Learn how you wish my Catalogue, I please my store, at your very door, and enable my buyers thousands of miles away to obtain it, or supplies as safely and cheaply as if they called in person at my establishment.

Ordered Seeds will arrive in Great Britain within a few days, and are offered and sent Postage and 1/6 Free. Direct Correspondence, No Agents.

Your most obedient servant.

F. C. HEINEMANN, SEED GROWER, ERFURT, GERMANY.

BONES! BONES! BONES!

CRUSHED BONES in all sizes, for VINE BORDERS, LAWNS, POTTING, GRASS LANDS, &c.

GARDENING APPOINTMENTS.

Mr. H. RUSSELL, late Foreman, Tatton Park, Knutsford, has been engaged as Gardener to LORD HINDLE, Doveridge Hall, Derby.

Mr. J. R. ROBBURN, for the past twelve years Head Gardener at 'Coombe' House, Croydon, has been engaged as Head Gardener to Miss WATNEY, Haling Park, Croydon.

Mr. WILLIAM MEADS, until recently at Beckett Park, Shrivensham, Berks, for fourteen years, has been appointed Head Gardener to ALEXANDER HENDERSON, Esq., Buscot Park, Faringdon, Berks.

WANT PLACES.

Letters addressed "Vote Re-vote" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in receiving by Postal Order that it should be paid in payable at No. 42, DRIFFY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and the name of the person to whom it is payable, to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST OFFICE MONEY ORDER.

NOTICE TO ADVERTISERS. In many instances Remittances in Payment of Report Advertisements are received without name, address, or anything beyond the postmark, on envelope by which to identify the sender; loss in all such cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give the Name and Address, and also a Reference to the Advertisements which they wish inserted.

Gardeners, Foresters, and Farm Bailiffs.

LITTLE and BALLANTYNE, The Queen's Nurserymen and Seedsmen, Carlisle, invite correspondence with Landed Proprietors, Agents, and others requiring the services of GARDENERS, and FARM BAILIFFS. Their extensive business relations throughout the Kingdom enable them to distinguish men of good character and ability, such as they would be glad to recommend.

RICHARD SMITH and CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Square, Worcester.

Head Gardeners.

JOHN LAING and SONS can at present recommend with every confidence several energetic and practical MEN of tested ability and first-rate character. Ladies and Gentlemen in want of GARDENERS and BAILIFFS, and HEAD GARDENERS for first-rate Establishments or Single-houses, &c., will be glad to have full particulars by applying at Stansfeld Park and Rutland Park Nurseries, Forest Hill, London, S.E.

B. S. WILLIAMS and SON beg to intimate that they have at present in their Nursery and upon their Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JURY MAN, and who will be glad to have full particulars of the above will please send full particulars, when the best selections for the different capacities will be made.—Victoria and Paradise Nurseries, Upper Holloway, N.

WANTED, by a young LADY, engagement in good Glass Florist Business. Good references.—A. FAIRAN, 2, Verulam Terrace, West Street, Colchester.

HOLLOWAY'S PILLS.—The sudden changes, frequent fogs, and prevailing dampness, sorely impede the vital functions, and conduce to ill-health. The remedy for these diseases lies in some purifying medicine, like these Pills, which is competent to grapple with the mischief at its source, and stamp it out without extracting the nerves or weakening the system. Holloway's Pills extract from the blood all noxious matters, purify the action of every disordered organ, stimulate the liver and kidneys, and relax the bowels, in curing chest complaints, these Pills are remarkably effective, especially when aided by friction of the Ointment on its walls. This disease will cure you of certain, steady, and beneficent progress, and sound health will soon be re-established.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of glass-cases, from the large-st range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant ProTECTORS, and Garden FRAMES; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **PRICE 2s. POST-FREE.**

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentlemen waited on in any part of the country. Plans and Estimates free on application.

TO COMPETITORS, and all who require Seeds and Plants of the choicest and most reliable kind, we wish to send our New CATALOGUE and Competitor's GUIDE (28 pages) gratis and Post-free. TEN CERTIFICATES of MERIT were awarded our strains of Vegetables at the Great Vegetable Conference held by the Royal Horticultural Society in 1889.

NINE FINE CLASS CERTIFICATES and 'Commendations of Strains' have been awarded by the Floral Committee of the Horticultural Society to our 'Early Queen'. It has been given to our Florist's Flowers, most of them after trial at Chiswick. DOBBIE and CO., Seed Growers and Florists, Rothsay, Scotland.

Broccoli.—A Good One not Easily Got. HARTLAND'S 'APRIL QUEEN'.—Is a sterling novelty from South of Ireland. Certainly one of the best in cultivation for use during the month of April and May. The heads are of immense size, and the leaves, which are most abundant and peculiar in colour, form such a thorough protection, that the outer appearance, before the heads are cut, is highly peculiar. It has been grown locally to great perfection—some heads weighing 14 lb., from the very close protection—white as snow.

W. M. BAYLOR HARTLAND, Old Established Seed Warehouse, 24, Paternock Street, Cork. Wholesale, HURST and SONS, London.

NEW CHRYSANTHEMUMS. Awarded Silver Medal and twenty Certificates, 1889. The finest collection in Europe.

MRS. S. COLEMAN, awarded six First-class Certificates; golden-bronze open, shaded rose, from Princess of Wales. 5s. each, 3 for 12s. 6d.

ADA SPAULDING, the largest incurred variety ever raised; color deep rose, petals highly ruffled. 5s. per dozen, and four other Cups and Prizes in America as the best seedling, 5s. each.

JAMES LAMBERT, sport from Lord Alcester; color, creamy-white, standard rose; double, and superior to Early Duke or Golden Queen in build and color; considered the best of the Queen family. 3s. 6d. each. (First-class certificate early in March. I held the stock of these three grand novelties; no exhibitor can win in future without them.)

CATALOGUE of over 100 splendid novelties and genera in Press, price 6s. gratis to customers. Culture, by E. MOLYNEUX, W. Tunnington, and G. Orchard. ROBERT OWEN, Floral Nursery, Maidenhead.

SMALL SHRUBS, &c.—Arctostaphylos uva-ursi, 10 inches, 50s. per 100; Abies orientalis, 2 yrs., 30s. per 1000; Aralia Sieboldii transplanted, 8s. per 100; Japan Box, Bushy, 6s. per 100; Sweet Bays, 2 yrs., 30s. per 1000; Cupressus macrocarpa, 6 to 8 inches, 10s. per 100; dog, 9 to 10 inches, 10s. per 100; Cupressus erecta, 2 yrs., 6 to 8 inches, 60s. per 1000; C. striata, 1 foot, 12s. per 100; C. Alonii, 9 inches, 8s. per 100; Escallonia macrocarpa, 40s. 12s. per 100; Larunculus, 8 inches, 8s. per 100; Oak, Evergreen, 1 year, 35s. per 1000; Pampas Grass, 9 inches, 50s. per 1000; Rhododendron ponticum, 1 yr. transplanted, 25s. per 1000; Yucca gloriosa, 10 inches, 10s. per 100; Præcox, anemone, 14s. per 100; Pinea Ficus Centra, 3 yrs., 20s. per 1000; Pinea insularis, 1 yr. transplanted, 30s. per 100; P. excelsa, 1 yr., 4s. per 100; Pinea pinus, 1 yr., 4s. per 100; P. THE ILLUSTRATED GUIDE FOR AMATEUR GARDENERS, SPRING, 1890.

This superb work, enclosed in a charmingly printed Coloured Wrapper, contains 132 pages, imperial size, of beautifully printed letter-press, and upwards of 170 fine Wood Engravings, 2 splendidly finished Coloured Plates, original articles on the Rearing of Flowers from Seed and Culture of Garden Crops, a fine and Select List of Choice Kitchen Garden and Flower Seeds, Seed Potatoes, Florist Flowers, Lilies, Gladioli, Roses, &c., and all the important Novelties of the Season. This will be found incomparably the best and most comprehensive Garden Catalogue yet sent out.

Price 1s., Post-free. To be deducted from Order when sending.

DANIELS BROS., ROYAL NORFOLK SEED ESTABLISHMENT, NORWICH.

GOLD MEDAL.

Quite the most original CATALOGUE in the Trade. Terms and Prices certainly the best. Post-free to every Applicant.

Every Gardener should see this List, because a number of exceedingly fine things can only be had from us. We very urgently indeed press gardeners to write for this List.

The New Japanese Primulas, the most startlingly remarkable flowers ever raised in this group. Introduced to us generally known as Primula sinensis. Most highly praised by every horticultural paper, and by the Times and London Press. Three Medals in three weeks. These are of such very special character, and will be so much talked of this spring, that every lover of choice flowers should see our full account of them in Catalogue.

Gold Medal for Tuberous Begonias.—The cheapest in the trade. Every lover of good Begonias should see our List. We have been delightfully successful, and our strain is rated beyond all description.

Seeds that Give Satisfaction.—Our great strength as a seed firm, and the cause of the extraordinary growth of our business, is the splendid quality of our strains of flowers, and the front rank reputation we have for Exhibition Vegetables.

£50 in Prizes and Two Medals are offered by us to our customers only, on so ingenious a plan that all can compete on fair and equal terms, wherever they may reside. All who can grow things well should see our Catalogue.

The best proof of our confidence that our terms and prices are of the best is that we send our Grand, Illustrated, Descriptive, Full Cultural note CATALOGUE, Post-free to every applicant.

RYDER & SON, SEED MERCHANTS, SALE, MANCHESTER.

CARNATION, GLOIRE DE NANCY.—

We are sending out our own strain, the grandest white, clove-scented flower in cultivation; flowers from 6 to 9 inches long; for cutting, border, or conservatory decorations, it has no equal; good strong rooted layers, ready to pot up or plant out, 30s. for 100, 15s. for 50, 8s. for 25. We have also a grand lot of the true OLD RED CLOVE layers (we never had letter) at 20s. for 100, 10s. for 50, 6s. for 25; also a fine lot of the COLNETS, bright terra cotta, and ROSEY MOON, striped pink, at 20s. for 100. And a grand lot of double white PRIMULA, in 5-inch pots, in flower and bud, at 10s. per doz.—COLLINS and SONS, Cumberland Park Nurseries, Willington Junction, W.

BEGONIAS A SPECIALTY.—Awarded Four Gold Medals. Seed saved from Prize Plants. In beautifully illustrated Packets, choice mixed, Single or Double varieties, 1s., 2s., 6d., and 8s. per packet. Colours—Single, 12 named varieties, 5s., 6d.; 6 ditto, 3s. Tubers, Named Singles, from 12s. to 42s. per doz.; Unnamed Seedlings, 12s. to 21s. per doz.; Bedding, choicest, 6s. and 8s. per doz.; choicest Named Seedlings from 42s. per doz.; Unnamed, very choice, 24s. and 20s. per doz.; choicest Mixed, 18s. per doz. Order direct from us, to procure our splendid strain. CATALOGUES gratis.

HENRY CANNELL & SONS

Have the largest and most complete collection (22 acres) of the above, and will be pleased to send Catalogue of Prices and full particulars.

BLACK PANSY.

NO Pansy of recent date has been so much admired or cured such general comment, as our (true Black) Eynshford Sweep did at the last great show at the Temple, and was admitted to be a great acquisition. During the coming season it will be a most conspicuous object in the garden.

Also four others, splendid border varieties, equally as distinct and beautiful.

For full particulars and illustrations see Floral Guide.

Seeds, 2s. 6d. per packet; plants, 1s. each; 8s. per doz.

HENRY CANNELL & SONS' GARDEN GUIDES.

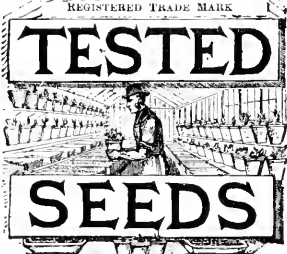

OUR NEW CATALOGUES of PLANTS and SEEDS—indeed, EVERYTHING for the Garden—have been posted to our customers, and we shall be pleased to also send them to all who contemplate purchasing plants and seeds. They convey information of the greatest possible value; no other work of this description bears any comparison. Four Coloured Plates, and Six Hundred Illustrations. Being located in Kent, our Plants and Seeds will be found very superior. We possess the finest strains in the world.

KENTISH SEEDS PERFECT ONLY direct from

WEBB'S NEW PEAS 'ROYAL STANDARD'

PEAS WEBB'S ROYAL STANDARD. This is a distinct and excellent New Pea. It grows from 5 to 6 feet in height, has an extremely hardy constitution, is enormously prolific, with thick, wide, blunt pointed pods of the No. Plus Ultra type, but much larger. It merits a high place amongst main crop and late sorts, and its flavour at all times is second to none. I have tried scores, and might safely say hundreds of new Peas during the last ten years, and this is one of the few that have given me complete satisfaction.—From Mr. J. MITCH, Gardener to C. R. M. Talbot, Esq., M.P., Morgan Park.

Price, 3s. 6d. per pint.

NOVELTIES OF THE PAST YEAR.

(Continued from p. 8.)

EACH new year proclaims the triumphs of the hybridist and raiser of improved varieties of garden plants from seeds. Seeing the rewards the gardener gets in this direction, it has often been remarked that there are so few workers in this interesting field. Probably a great many persons who have material in their hands would do something in assisting floriculture in this way but for the fact that while we praise and admire the plants which are presented to us as improvements, we do not know the number of worthless varieties which have been raised conjointly with them, and which have received the same care until they flowered, and proved that they were of small or no worth; and in many cases the raiser has difficulty in making the few good things obtained recoup him for the trouble and cost incurred. Much will doubtless depend in this field of work on the selection made, and on working it intelligently.

In these particulars Messrs. J. Veitch & Sons stand pre-eminent, as witness the excellence of the work done on Hippeastrums, the Amaryllis of gardens; the warm greenhouse Rhododendrons, the winter-flowering section of Begonia, of which John Neal is a type; and the Orchids, Nepenthes, and a variety of other plants. In the Rhododendrons we have mentioned, there are, thanks to their efforts chiefly, more beautiful and varied flowers, a fact which has caused in many gardens a house to be devoted to their cultivation. The curious crosses with Rhododendron javanicum, Lord Wolseley, and Azalea indica promise still further augmentation to the class; while their hybrids with the brilliantly-coloured and neat-habited R. Curtisii have already evolved a new section which has yet to be perfected. Among their Rhododendrons cultivated in 1889, Messrs. Veitch enumerate the handsome R. Her Majesty (Fosterianum ×

arborescent), with large, almost flat, white, fragrant flowers, delicately tinted with blush on the outer sides; and an Award of Merit was justly made to the following: R. Duchess of Fife, R. Ophelia, R. Virgil, R. Ne plus ultra, R. Princess Beatrice, and R. Aspasia, all of which possessed improvements on old forms, and were exquisite in colour.

In *Hippeastrum* (*Amaryllis*), the certificated flowers of the John Ruskin type are very rich in hues of crimson, and one plant of this type—Optima—has the largest known flower, its diameter being over 9 inches. H. Terentian, H. lustrous, H. Mirabella, H. Sirocco, are new varieties of great merit.

Messrs. Veitch & Sons received a First-class Certificate at the Royal Horticultural Society for *Nepenthes Curtisii*, and their new N. Burkeii proves one of the richest coloured of pitcher plants. *Cornus sibirica Spathii*, with yellow variegation; *Dracena Donceii*, green leaves striped with white; *Epiphyllum Makoyanum*, a richly coloured compact plant; *Retinospora filifera aurea*, a pretty and neat habited Conifer; the curious and distinct *Asplenium scandens* and the fine Vallota-like *Cyrtanthus sanguineus*, an old but still rare plant, were certificated to Messrs. Veitch during the past year. Late in the year the same firm received also recognition for their compact-habited, floriferous, and brightly-coloured Carnation, "Winter Cheer," which may be truly said to be of great excellence. Among the *Hippeastrums* other good new ones of the year were *Salvator Rosa*, *Vulcan*, and *Dark Beauty*, all of Messrs. Paul & Son's raising.

Two new Aroids have been introduced by Mr. Wm. Bull, viz., *Anubias heterophylla*, a curious and fine species; and *Anthurium cymbiforme*, which has white spathes and salmon-pink spadices.

Sir Trevor Lawrence was awarded a First-class Certificate for the noble-looking *Anthurium leodense*; and among seedling *Anthuriums* he has flowered one named appropriately *A. Burfordense* ×. The handsome and extensive family of Iridaceæ receive noteworthy additions in the hybrids of M. Lemoine, of G. *gandavensis*, and G. *Saundersii*. Others have also been at work on the same species, and in *Watsonia iridifolia O'Brienii*, a snow-white variety, collected as a single bulb among thousands of coloured varieties, we have one of the finest of white Irids. In recognition of the beauty of the plant, a First-class Certificate was bestowed on it; and also on Mr. Ware's old but beautiful *Watsonia rosea*, by the Royal Horticultural Society.

Messrs. B. S. Williams & Son received First-class Certificates for two valuable new plants in *Sarracenia decorata* × and *Carludovica palmifolia*, the latter a very elegant and useful plant.

FERNS

mainly seem to get new additions from the market growers by variations, obtained among their numerous raisings. Among those of Mr. H. B. May, *Pteris cretica nobilis*, *P. leptophylla princeps*, and *P. serrulata densa* are fine sports, well adapted for marketing, and for which the firm propagates and grows them. The *P. serrulata plumosa* of Mr. W. Colman, and the curious and pretty *P. tremula Smithiana*, of Messrs. B. Smith & Co. seem likely to answer well for the same purpose. Messrs. W. and J. Birkenhead, of Sale, received First-class Certificates for two fine hardy Ferns in *Athyrium l. f. regale*, Barnes' variety; and *Struthiopteris pennsylvanica recurva*, and there can be no doubt that if their extensive nurseries at Sale

were nearer to London, we should see more of the beautiful specialities in Ferns with which they make such an elegant display wherever they exhibit. *Aspidium* (*Cyrtium*) *falcatum* Fensom's variety must not be forgotten, for it is a very distinct and handsome plant, and the *Adiantum capillus veneris grandis* of Mr. T. Jannock may be likened to a dwarf *A. Farleyense*. Palms receive one noteworthy species in *Phoenix Roebelenii*, a pigmy tree Palm imported from the Laos States, Siam. In other sections of

FLORISTS' FLOWERS.

good work has been done amongst the so-called florists' plants, and chiefly by the same hands. With tuberous Begonias, Messrs. H. Cannell & Sons have made great advances, especially in the double-flowered kinds, and in the matter of producing a very dwarf, compact, and extraordinarily floriferous strain; whoever desires a superb selection should get those that received Awards of Merit and First-class Certificates during last year, viz., A. Blanc, Frank Beadle, Mrs. Litkie, Mrs. A. Moens, Mrs. Cayzer, Lady Harriet Cavendish, Sir W. C. Brooks, and Rosebud; and Messrs. Cannell also received First-class Certificates at the Royal Botanic Society for A. F. Barron, J. Douglas, J. Marshall, Hon. Mrs. G. Goschen, Imogen, Lady Lewisham, and Madame Souppert, all good and distinct.

Messrs. J. Laing & Son, Forest Hill, S.E., also keep up their old repute in these plants, their Stanstead Gem and Duchess of Teck having been awarded First-class Certificates by the Royal Horticultural Society, and their gigantea, Lady Stafford Northcote, Miss French, and Stanstead Gem received a like award from the Royal Botanic Society.

Both Messrs. Cannell and Messrs. Laing are entering heartily into the culture and introduction of *Chrysanthemums*, and both have brought forward good varieties; and Mr. Stevens, Mr. T. S. Ware, and Mr. Owen, are other introducers of prominence; but the most singular novelty is the hairy white *Chrysanthemum* Mrs. Alphus Hardy, of Messrs. Pitcher & Manda, an American firm of Orchid growers and dealers in new plants. It is distinct, and having a not unpleasant fragrance it will be admired on that account; and when it is subjected to the higher degree of culture that *Chrysanthemums* get in this country, it will doubtless be much sought after.

The Dahlia record shows Messrs. Keynes, Williams & Co., Mr. T. S. Ware, and others, still at work on these plants, and the fine displays which Messrs. Kelway & Son, of Langport, have also made at times at the Drill Hall and other large gatherings, show to what a degree of perfection the flowers of *Delphiniums*, *Gladioli*, *Pteronix*, *Gaillardias*, *Pyrethrums*, and other flowers, have been brought. The awards at the different meetings at which they were displayed were numerous.

The Rose, always a favourite, has added a few novelties out of the many which have been exhibited, some of which have received awards. We name *Claire Jacquier*, Silver Queen, and Duchess of Albany, shown by Messrs. W. Paul & Son; and the fine *Souvenir de S. A. Prince*, shown by Mr. G. Prince; and *Gloire de Margottin* by Messrs. H. Lane & Son.

Among other novelties recognised as being of worth will be found the *Clivea* John Laing, of Messrs. J. Laing & Son; C. Lady Wolverton, of Mr. P. Davidson; *Taxus adpressa variegata*, of Messrs. Fisher, Son, & Sibray; *Fuchsia Dorothy Fry*, of Mr. J. Fry; *Garraway's Double White Mignonette*, *Mimulus grandis*; *Pansy*, Golden

Crown; *Dianthus Snowflake*, *Primrose Blue Gem*, and P. the Mikado, all five shown by Mr. R. Dean, Ealing; and from his beautiful and remarkable collection of *Primroses*, Mr. G. F. Wilson, Weybridge, had the Quakeress and G. F. Wilson, which were awarded Certificates of Merit.

Professor Michael Foster introduced a pretty novelty in *Primula petiolaris*; and Messrs. Ryder & Son, by their collection of new varieties of *Primula Sieboldii*, demonstrated the wide variation to be obtained in this plant.

In Auriculas, Mr. J. Douglas produced several novelties, his *Heather Bell* and *Marcus Aurelius* being perhaps the best two; and Mr. H. B. May's two new *Bouvardias*, B. Hogarth fl. pl., and B. Mrs. R. Green, are advances on the older varieties.

Among popular flowers to be obtained from seeds, no better example of obtaining distinct varieties of fixed type which come true from seeds, for at least a number of years, can be mentioned than the beautiful collections of Sweet Peas of Mr. H. Eckford, of Wem, Salop, whose strain is acknowledged by the Floral Committees' awards whenever they are exhibited. In the same class may be placed Messrs. J. Veitch & Son's strain of Canterbury Bells and double and single *Rhodanthe*, Mr. J. Walker's Sweet Williams, *Capsicum Coral Red* (S. Mortimer), and Mr. J. James's *Cinerarias*.

The favourite Lilies received certificated additions during last year, chiefly to improved varieties of well-known species. Of these are the beautiful L. *Wallichianum superbum* of Messrs. Hugh Low & Co., L. *Martagon album* of Mr. Ware, and Messrs. Barr & Son, and L. *pardalinum luteum* of Messrs. J. Veitch & Sons. *Iris Rosenbachiana* was also certificated to Mr. J. Douglas and Messrs. Barr & Son—the latter firm exhibiting some fine things among their large collections of *Narcissus*.

One of the most beautiful and interesting is N. Johnstoni Mrs. Geo. Cannell, which, with other novelties, Mr. Barr himself collected during his recent journeyings in search of *Narcissi* in Spain, the gatherings being now incorporated in the million of bulbs made up of over 500 varieties which Messrs. Barr & Sons have planted out for flowering this year, and which will yield, doubtless, some valuable additions.

In other kinds of hardy plants Messrs. Paul & Son, Mr. Ware, Messrs. Barr, and others have each many novelties to show; and in provincial nurseries there are, doubtless, a fair proportion which have not yet attained fame, but which will assist in keeping up the unflagging progress which floriculture has made in the British Isles during the present century.

Among the novelties of the year illustrated in the pages of the *Gardeners' Chronicle* during the past year will be found *Chrysanthemum* Mrs. Alphus Hardy, November 9, p. 533; *Lemoine's Gladioli*, September 25, p. 350; *Nepenthes Burkeii*, November 2, p. 493; *Nepenthes Curtisii*, December 7, p. 661; *Phoenix Roebelenii*, October 26, p. 475; *Pteris cretica nobilis*, November 16, p. 561. *James O'Brien*.

NEW OR NOTEWORTHY PLANTS.

ANGRÆCUM ICHNEUMONEUM, Lindl.

ONE might imagine this to be a *Reichenbachian* species, judging from its name, but such, however, is not the case, as it was first described many years ago by Dr. Lindley, who evidently saw some resemblance in its flowers to the *ichneumon* fly—a kind of insect whose chief peculiarity is its habit of preying on other insects. Although so long known to botanists, it may nevertheless be looked upon as new to cultivation, as it does not appear to have been introduced in quantity until about two years

ago. I met with a fine plant of it in flower in Mr. F. G. Tautz's collection in November last, but I fear it is one of those plants which will find little favour with horticulturists, but will no doubt drive the botanists into ecstasies. It is characterised by its distichous, oblique, ligulate, acute deep green leaves, which are from 6 to 12 inches long; and pendulous racemes of flowers from 8 to 10 inches long, of closely arranged pale yellowish white flowers. The plant in question had three such racemes, and on one of them were counted fifty flowers, each being over half an inch across when spread out. The slightly recurved sepals and petals are oblong-acute, the former being somewhat broader than the latter. The lip is oblong, slightly convex, and three-lobed or toothed in front, and furnished behind with a spur more than 1 inch long, the basal half being terete and slender, while the apical portion is much inflated and slightly compressed, reminding one, from its translucent appearance, of the air-bladder of a small fish. The column is short, thick, and truncate. *John Weathers.*

IRIS BAKERIANA.

This will prove a most valuable addition to the Niphon group, to which it belongs, and its good qualities make it quite worthy of being distinguished by the name so happily attached to a new member of this genus. In the Cambridge Botanic Garden, under a south wall, the flowers were open three days before the Christmas week, and they lasted three days after, being quite unaffected by the 11° of frost that occurred on the morning of the 29th. In opening, its flowers preceded those of *I. histrio* by about two days, but it is possible that these particular plants have yet to fix their permanent flowering season, for our climate, as it is said in the *Botanical Magazine*, that the flowering season is in February and March. The flowers that are portrayed in that work were produced at Shelford. The bulbs here were presented by the great benefactor of Baden, Herr Max Leichtlin. The chief attractive features of the four flowers produced consist in the beautiful painting of the blade of the outer segments, in the plain lavender-coloured inner segments, styles, and crests, and in the strong and delightful perfume of Violets pervading the flower. The blade of the outer segments has a terminal lip-like area of deep purple-violet colour, and above this in actual position, it is ornamented with small oblong or elongated spots of the same colour upon a white space. In these particulars the four flowers display some degree of variation, one having the blade almost entirely occupied by the lip-like violet area, and the others differ in the degree of frequency and distribution of the spots. They all agree in having a fairly regular and almost exactly semicircular termination to the white ground space against the deep violet lip, and also in having very small oblong or elongated spots; and, further, in showing no indication whatever of a yellow median line.

In all these points they differ from the figured specimen in the *Botanical Magazine*, which shows the blade to have an inconspicuous yellow median line or mark, to be painted with comparatively large and round spots, and to have a distribution of the deep violet mass of colour, that may be described as going round the blade and as not forming a lip. The end of the white ground is not semicircular, and its margin is broken into a blotchy manner, while in the flowers here described it is broken into slightly by blunt and short points of colour.

The coloration is not at all the same, and it would seem, from the figure, that there may be two forms of the species, one, that figured in the *Magazine*, and the other that of the Cambridge plants, each of which might have its own slight variations as here described. Though it may not be so, it would be interesting if there should be more than one stock. As a species it comes very near to *I. reticulata*, but is clearly distinct from it by the cylindrical 8-ribbed leaves, and like *I. reticulata* it stands apparently without any very near relative. Professor Foster, who describes this species in the *Botanical Magazine*, t. 7084. after

referring to the cylindrical leaves in comparison with those of *I. reticulata*, says:—"As minor differences may be noted, the absence of any marked crest or ridge on the fall, the more ovate and more pointed blade of the fall and the flange at its base." This Armenian Iris is one of great interest as well as of beauty, and its discovery is due to the Rev. G. F. Gates, of the American Mission. *R. J. Lynch, Botanic Gardens, Cambridge.*

TONQUES IN TREES.

(Continued from p. 71, in vol. vi.)

TO CARVE HIS RUSTIC NAME UPON A TREE.

We shall recognise at once the extent to which flower names are preserved in personal and family nomenclature. Of Christian names we have Rosa and Rose, Flora, Margaret, Laura, less commonly Daisy, Lily, Chloe, Narcissa, Cherry, Violet, for women; Basil, Narcissus, Hyacinth, for men. Readers of George Meredith's splendid novels will recall the two sisters Dahlia and Rhoda. The gardener in Crabbe's *Tales*, astonished the parson by bringing a Lonicera, or Honeysuckle, to the font:—

"Why Lonicera will thou name thy child?
I asked the gardener's wife in accents mild.
We have a right, replied the sturdy dame,
And Lonicera was the infant's name.
If next a son shall yield our gardener joy,
Then Hyacinthus shall be that fair boy;
And if a girl, they will at length agree
That Belladonna shall that fair maid be."

Surnames are Wood, Woodland, Woodfield, Crabbe, Appleyard, Sweetapple, Birch, Okes, Bayes, Elder, Nutt, Bush, Hayes, Hodges, Hawthorn, Heath, Rush; we have Flower, Berry, Parsley, Rice, Weld, Woodruff, Leek, Onions, Peppercorn, Primrose, Leaf, Thorn. Cobb is a familiar surname in Kent, the home of the large Cob-nut; we remember Peter Quince in *Shakespeare*, Sir Peter Teazle in the *School for Scandal*, Box in the well known farce. Spink is a corruption of Pink, Arnott of Earth-nut, Kemp of Hemp, Snooks of Sevenoaks. Weld is the wild Mignonette, Sobright the wild Sage, Pettigrew the Butcher's-broom, Harlock the Bardock. The advertising columns have familiarised us with Pear's Soap and Harper Twelve-trees, with singular propriety Linnaeus, the founder of modern botany, takes his name from London; and the present Curator of Kew Gardens is Mr. Thistle-ton Dyer.

"A PEARL TO A PEARL."

It is natural that names of places should commemorate the plants which grow or grew around them. We shall think of Appleby and Appledurcombe, of Maple Durham, Saffron Walden, Bromsgrove, Shrewsbury (anciently Shrubbury), Basilsleigh, Woodstock, Grassmers, Nettlebed, Poplar, Yewdale, Evelme, Nine Elms, Oakham, Berkhamstead, Halse (or Haze), Heatherton; of the London suburb, Primrose Hill; of Strawberry Hill, sacred to Walpole in the last century—to Lady Waldegrave in this; of Box Hill, of which inimitable Mrs. Elton and her sister from Maple Grove were in the habit of "exploring." In the same way, many plant-names contain the actual geography of their origin. Canterbury Bell is obvious, so is Gueldres Rose. Alexanders, the *Smyrnum olusatrum*, comes from Alexandria; Candytuft, from Candia; Elecampane, from Campania; Medick, from Media; Caraway, from Caria; the Mayduke Cherry, from Medoc; Walnut, or Welsh-nut, from the north of Italy, called Walsch, or foreign land, by the German settlers. Peach, is Persicus; Sbalot, Ascalonicus; Spinaech, Hispanicus; Damson, rightly spelt, is the Damascene Plum, a correction less clear in the Dames or Damascus Violet, since the mistake is there stereotyped, as often happens, by its Latin equivalent, *matronalis*. In like fashion are enshrined in plants the names of their discoverer, or of eminent contemporary botanists:—Dahlia, of the Swedish botanist, Dahl; Fuchsia, of Leonard Fuchs; Tradescantia, of John Tradescant, first keeper of the Oxford Botanic

Garden; the pretty northern Linnaea, of Linnaeus; Sibthorpia and Sherardia, of famous Oxford botanists; Nicotiana, of Jean Nicot, a Portuguese, who first popularised Tobacco in Europe; Cinchona, of the Countess Chinchon, to whom we owe Peruvian bark; and by quoting less ordinary plants, the list might be much extended.

I MARK TIME, DOST THOU?

Some names are bound up with the time of year in which the flowers bloom—such are Christmas Rose, Summer Snowdrop, Lent Lily, Pasque Flower, Pink (corrupted from Pinkten, Peacock), St. John's Wort, opening on St. John's Day; Michaelmas Daisy, May, or May-flower. The historic May-flower of the Pilgrim Fathers is named, not from our Hawthorn, but from the lovely *Epigaea repens*, which springs up and covers the ground in North America as soon as the snow has melted. Tennyson has stamped the month of March as "the roaring moon of Daffodil and Crocus;" the summer Jenneting with which he tempts the blackbird is the early or June-ting Pear.

THE HARMLESS FOLLY OF THE TIME.

We may be allowed a glance at the delightfully suggestive names which our forefathers gave to native plants. The Clematis was the Old Man's Beard, the Traveller's Joy, the Virgin's Bower, the Alchemilla was the Lady's Mantle, its large leaf having the fringed edges and picturesque foldings of a shawl; the delicate Fern called Lady's Tresses resembled the spiral curls common fifty years ago on ladies' foreheads. From its competitively hanging head and half-hidden face, the Pansy bears a whole catalogue of amatory names; it is Heart's-ease, Love in Idleness, Pink of my John, Tittle my Fancy, Cuddle me, Jump up and Kiss me, Kiss behind the Garden Gate. The Devil in a Bush bears horned capsules peeping viciously out of a finely-divided involucre; its softer name is Love in a Mist. Lady-smocks, used by Isaac Walton for the Cuckoo-flower, waved in the wind like smocks or shirts hung up by fairies to dry. None can fail to see the resemblance indicated in the leaf of Coltsfoot, Crowfoot, Pennywort, Hoand's-tongue; in the flowers of the imitative Orchids, of Ragged Robin, Lady's Slipper, Mourning Widow, Maiden Blush; in the fruit of Crane's-bill, and Bird-footed Trefoil. The Goat's-beard, closing its yellow or purple blooms at 12 o'clock, is the Go-to-bed-at-Noon; the yellow-rattle explains itself to anyone who will apply it to its ear and shake it; Touch-me-not is the wild Balsam, whose ripe pods when touched burst and scatter their seeds; Naked Boys is a somewhat liberal but graphic image for the clean, slender, leafless perianth of the autumn Colechicum.

THE SENSITIVE PLANT IN A GARDEN GREW.

There are plants whose bizarre or remarkable character requires brief separate notice. Such are the gigantic Sequoias of the Sierra Nevada, reaching 450 feet in height, with a trunk 116 feet in circumference. To fell one of these required the labour of five men during twenty-two days; and, after it had been fairly severed at the stump, wedges were driven in for two days with a battering-ram before it could be thrown out of its equilibrium, and compelled to fall. The fables of the poisonous Upas have dwindled to the fact that the effluvia from its juice, when newly cut, produces eruptions of the skin. There is the Cannon-ball tree of Guiana, whose enormous fruits, falling in the stillness of a tropical forest, produce the effect of artillery; the Rafflesia, a parasitic flower, measuring a yard across, its smell of tainted beef attracting flies to fill its fleshy tissues with eggs and maggots; the Urania, or Traveller's Tree, of Madagascar, from whose immense leaves, when pierced during the most arid season, quarts of delicious water can be drawn; the Cow Tree (*Galactodendron*), yielding a profuse flow of fragrant and wholesome milky fluid; the grotesque Scythian Lamb, its brown hairy root-stalk so nearly simulating an animal, that it was believed to hang down and feed upon the grass about it; the Wind-witch

of Kansas (*Cyclostoma platyphyllum*), a Thistle 6 feet in diameter; it dries, breaks off from its root, bounds before the wind, links itself with others to the number of six or seven, till the enormous mass, careering over the level plain, spreads terror amongst men and beasts. In the passage of the Psalms—"Make them like unto a wheel, and as the stubble before the wind," this monster [or one like it] is said to be indicated by the word "wheel."

Deeply interesting also are the cases of vital action on the part of plants, suggestive almost of conscious volition and spontaneous energy. The Sensitive Plant shrinks not; only from a touch, but under the influence of chloroform it becomes indifferent to assault and handling. The Telegraph Plant of India (*Desmodium gyrans*) raises and depresses its leaflets with a jerking motion. Our own microscopic *Oscillatoria*, common in damp and mossy ground, creep, recede, wave, and curl, with regular but unaccountable meanderings. The Diatomaceæ of the ditches, exquisite skeletons of flint clothed with vegetable tissue, swim rhythmically by admitting or expelling from their frames tiny jets of water. The Water-soldier rises from the muddy bottom to the surface of a pond that it may expand its blooms, sinking again so soon as they are withered. The Vallisneria bears its male blossoms deep below the surface of the water, its female blossom floats upon the top; at the season of maturity the male breaks off and ascends, that its pollen may reach the pistil. The belief that Mummy Wheat can retain vitality through forty centuries is exploded; yet the sudden and profuse appearance of new plants in a particular spot or district, points to extraordinary power of dormancy under unfavourable surroundings, with a quick consciousness of change favourable to germination. If the plough be carried into the ground a foot deeper than usual, weeds will appear which have not been observed before. The quarrying for cement in Warwickshire some years ago, was followed by abundant growth of the Bee Orchis, previously a stranger to the ground. When a large Beech tree is cut down, the ground below, which its growth has rendered barren, will in the following year sometimes be densely carpeted with wild Strawberries. Land treated with nitrate of soda yields masses of White Clover. A traveller crossing the battlefield of Linden, two days after the fight, turned away in horror from thousands of stripped unburied corpses which lay like sheep upon the plain. Visiting the same spot in the summer following, it seemed to him as though Isaiah's prophecy were fulfilled—"The earth shall disclose her blood and shall no more cover her slain;" for as far as the eye could reach the soil was concealed by millions of scarlet Poppies. *W. Tuckwell, Stockton Rectory, Rugby.*

(To be concluded.)

THE CULTURE OF WINTER CUCUMBERS.

How to keep up a supply of good Cucumbers during the winter months, is a matter of some importance to many country gardeners. When good houses have been built, and every appliance found that may be considered requisite, it is not an easy matter to keep up a continuous supply from a small house. Many gardeners have to face this and other difficulties, when their employers are unwilling to go to the expense of suitable structures. I have had in my time to grow Cucumbers in many queer-looking glass structures, and seen them grown in dog-hole-looking places, wherein the gardener could scarcely turn himself. In constructing glass-houses for the culture of Cucumbers or any other class of plants, it is of considerable importance to study well the requirements of the plants; and, indeed, this is mostly done. But another matter of equal importance is the comfort and health of the gardeners. It is quite trying enough to have to labour in houses with the temperature excessively high, without the addi-

tion of the body being cramped in a narrow space, wherein there is scarcely room to move the hands. Those of us who have lived in country gardens, where the atmosphere is pure, and also near London, with an impure atmosphere, know how much more difficult it is to keep such a tender-leaved plant as the Cucumber is in health near London, and I have no hesitation in saying that it is getting more difficult every year; and I am reminded that other growers of plants and fruits are very perceptibly feeling the effects of a more impure atmosphere. Mr. John Ward, of Leytonstone, one of our best gardeners, told me that some plants he used to grow well at that place ten years ago do not succeed now. Some thirty or more years ago the late Mr. James Gray, of Danvers Street, Chelsea, built a half-span Cucumber-house in his work-yard, and grew Cucumbers very successfully. The results were noted at the time in the *Gardeners' Chronicle* by Dr. Lindley. Soon after that I had to do with erecting various houses at Loxford Hall, and one of them, a Cucumber-house, was erected by Gray on the pattern of his own house at Chelsea; and I do not think I ever saw Cucumbers or Melons grow and fruit better anywhere else than in those; and so close were we to London that the glass had to be washed at short intervals to remove the dirt and soot left by fogs. The houses, large enough for a man to stand upright in and do his work with comfort, were 11 feet wide, 10 feet 6 inches high from the floor-line to the apex of the roof. The beds in which the plants were set were 5 feet wide. The path was below the ridge, and a stage was erected at the back of the house about 2 feet wide, and which was useful for growing Orange trees, Figs, and Vines in pots. We had a removable trellis for Cucumbers, and which was fixed as close as we could have it to the glass roof in winter, and further removed in summer. The houses were well heated by four rows of 4-inch pipes, so that it was not difficult to have a minimum temperature of 65° in winter during severe frost without overheating them. At that period there was no difficulty experienced in keeping up a constant supply of Cucumbers from four plants during winter; but ten years later, with the most careful culture, it was not possible to keep the plants in good health so long as before, and the Cucumbers were of poor quality, and I find it is the same now, though we are now further removed from the fog centre, and we cannot now obtain good Cucumbers before March.

An efficiently heated and well ventilated house is of the first importance, but all the details of the work must be well looked into. Bottom-heat is very necessary, and this was supplied in the house mentioned from two rows of 3-inch hot-water pipes. I found it a good plan to cover the pipes in with a good depth of brickbats, and over these a layer of fresh cut turf, the grass side being placed undermost, and where that is not to be got, rough litter will answer the same purpose fairly well. Next comes the compost, which should be about 15 inches in depth, and be light and rich, of good fibrous loam three parts, leafmould one part, and decayed stable manure one part. Sow the seeds about the first week in September, and do not allow the plants, which are to produce Cucumbers after Christmas, to carry any before that time. Over-cropping is a grave error, more especially in mid-winter. In a bed so wide as 5 feet, it is as well not to fill up the whole space at once with soil. Only about one half of it should be filled, and the hills kept compact by a wall of turves until they have become exhausted, when the remaining space may be filled up with compost.

The Cucumber has tender leaves, and when thinning out the growths, the gardener must be careful not to damage them. Overcrowding shoots and leaves is an error, and should be avoided. The plants may be kept in a good bearing condition for twelve months when well managed, and the leaves kept free from mildew and aphid and thrips. Of all the varieties of Cucumber in cultivation I have tried many, but still find my wants best supplied by

Rollisson's Telegraph, or any good strain of Telegraph.

Mr. Lockie, the raiser of Blue Gown, has produced a new variety—a perfect model of what a Cucumber should be; it has been named Lockie's Perfection. As I have seen it, it is 1 foot or more in length, round and straight. It is now being sent out by Mr. Charles Turner, of The Royal Nurseries, Slough, and was figured in our columns in 1889. *J. Douglas.*

LOOKINGE, WANTAGE;

THIS, the residence of Lord Wantage—Colonel Loyd Lindsay of earlier years, and by that name much better known—is surrounded by gardens of much beauty, which have often been noticed in these pages, the last occasion being on October 12 last year, at p. 405.

Our illustration (fig. 6) shows the house as it now exists, after many alterations and additions, its little parterre of flowers, with balustraded wall to separate it from the park, the adjoining conservatory and corridor of glass connecting it with the rooms; and, on the left hand, the village church. For a fuller description of the place, we refer our readers to the note given above.

THE BULB SEASON OF 1889.

In reviewing the season just closed, a few points of interest present themselves, which it may be well very briefly to chronicle. Speaking generally, it has been both encouraging and disappointing. Paradoxical as it may seem, this statement is fully borne out by the facts of the case. Early in May last there was every prospect of a very heavy crop of large, well-developed bulbs; the dry hot weather which followed soon altered the favourable appearances. The bulbs, lacking the needful moisture, were prematurely ripened, and, although in apparently good condition, they have been much smaller than in several previous years. This should not affect their blooming qualities, if they are fairly and generously treated; but where they are starved or neglected, the results are certain to be unsatisfactory.

While the size, and in some respects, the quality of the bulbs have been disappointing, the demand has been most encouraging. This remark applies especially to the trade of the legitimate dealer, and it is the more gratifying, when one notices the rapid development of the auction-sales, which it was at one time feared would crush out the dealer's trade, especially in the smaller towns. These auctions are a very sore point with seedsmen, and the determination to rigorously boycott those Dutchmen who "try to run with the hare and hunt with the hounds" can hardly be wondered at.

Taking the principal items in the catalogues *sciatim*, we have first to deal with:—

Hyacinths, and here the report must be favourable all round, with the minor exception of miniatures, the demand for these having fallen off considerably. Named varieties, especially those with distinct and rich colours, have been very largely in demand, both for private use and market trade. As some articles in your columns have recently showed, the numbers used for Covent Garden Market alone are enormous.

Hyacinths for bedding purposes have also had a largely increased sale. In this connection it is worth noting that the old-fashioned nondescript mixtures are losing their hold on popular favour, and second-size bulbs of good named varieties are gradually taking their place. Doubtless this is in some measure due to an improved taste, as well as an improved state of the public purse. This latter is a very important factor in all that concerns the bulb trade, as indeed of every other.

Tulips next claim our attention, and here the remarks respecting *Hyacinths* equally apply. Year by year the trade in these has progressed literally "by leaps and bounds." As a result, the stock of the best forcing varieties has run so low that prices have been from 10 to 50 per cent. higher than last

year, and yet, in spite of this rise, many of the later orders have not been filled. Quite recently a new feature has developed itself in connection with this branch of the trade, as several of the largest growers for market are sending back the bulbs to Holland after they have flowered, instead of throwing them to the muck-heap, as has usually been done.

The star of the Narcissi is still in the ascendant, and the Daffodil craze seems to be yearly increasing in intensity. Whatever may ultimately be the end of this matter, its present features are exceptionally interesting, as showing what can be done with Dame Nature, human and otherwise, when a few intelligent and energetic individuals take her fairly in hand. Only a few years ago we sang of the—

“Daffy-down-dilly by the side of the well,
A very pretty flower with a nasty smell,”

to that of the present season. The remarkably low prices at which some of the very best-named varieties have been offered may in some measure account for this; but in addition there can be no doubt that the beauty and utility of these “harbingers of spring” are being more fully recognised.

Our old friend, the Snowdrop, is still “way up” in popular favour; while *Scilla præcox* and *Chionodoxa lucila* are gradually winning their place as indispensable to every well regulated garden.

Anemones and Ranunculuses are once more beginning to receive the attention they deserve. In Mr. Mason's catalogue, before referred to, I find no fewer than 780 varieties quoted, many of them at prices almost fabulous. For many years, however, the list has been gradually curtailed, but, thanks to the efforts of our French neighbours, they are now being rescued from an undeserved oblivion. This is espe-

cially true of *Lily of the Valley* crowns, for in dealing with these, nothing less than millions will suffice to indicate the extent of trade.

Many other floral gems there are, none of which are permitted to waste their sweetness on the desert air. All have their circle of admirers, and may some day attain to the proportions and popularity now enjoyed by the Daffodil or the Hyacinth.

“Beautiful are they, every one of them
Bright stars of Earth, by which prechance we see
What Eden was, what Paradise may be.”

Impartially they light up the splendid mansions of the rich and the lowly dwellings of the poor, with beauties that delight and refine every sense that they affect, and leave no sting behind. By their aid, the drear and gloomy gulf which in these northern climes divides the golden tints of autumn from the flowers

FIG. 6.—LOCKINGE HOUSE, WANTAGE: FROM A PHOTOGRAPH. (SEE P. 40.)

but now *Nous avons changé tout cela*, and no one would think of offering bulbs of this genus without reminding us of the “Daffodil which comes”—I need not further quote.

In some respects the present craze reminds one of the famous and historical Tulip mania. Will the ending be the same, I wonder? Looking over a bulb catalogue issued in 1890, by John Mason, at the sign of the “Orange Tree” in Fleet Street, I find no fewer than 383 sorts of late border Tulips are quoted at prices ranging from 6s. to £20 per root. Alas, for the Tulip manias! to-day three lines, and sometimes only one, is sufficient for them; while in some cases they are omitted from the catalogues altogether.

Crocuses, neglected for several years, have this year been “booming,” and one must go back to the good old days when the Floral Bard (two rs, and a capital B, please), of Kynges Streete, with true poetic fervour, sang “Within a shield of verdant spears, the brilliant Crocus glows,” to find a demand equal

to that of the present season. The remarkably low prices at which some of the very best-named varieties have been offered may in some measure account for this; but in addition there can be no doubt that the beauty and utility of these “harbingers of spring” are being more fully recognised.

Under the miscellaneous heading, Irises, Lilliums, and *Freesias* have been the most largely in demand. The mere mention of the fact must suffice, although the extraordinary trade now carried on in the Bermuda Easter Lily deserves more than a passing notice. The same remark also applies to the sales

of spring, is spanned with a floral bridge of truly surpassing beauty.

Whether we view this matter from a sentimental or a business standpoint, the growth of trade in the means by which such good results may be accomplished is a hopeful sign for the future of humanity. The love of the beautiful more widely instilled and more warmly cherished will in process of time work out a much needed social, moral and physical revolution. The foregoing is in an imperfect degree a record of the progress made in one branch of this glorious and important work. S. B. D.

OLEARIA TRAVERSII forms an attractive tree, although the flowers are not remarkable for their beauty. The coriaceous leaves, of a bright-green on their upper surface, and white with silky down below, the white branches and involucre afford continuous changes of colour when the tree is agitated by the wind. It is the only New Zealand species of *Olearia* with opposite leaves. T. Kirk, in “*Forest Flora of New Zealand*.”

HYBRID RHODODENDRONS.

When the doctrine of evolution was brought prominently forward by Darwin, a number of his opponents were continually protesting against those who held his views, that they could never get seed from hybrids. But every florist could have told them they could get ample seed from almost any hybrid in plants that they pleased. They might take any species and pollinate it with any other, and get an abundance of seed, the subsequent hybrids being equally fertile. So that that objection to the doctrine of evolution vanished. Rhododendrons, it had been found, were very widely dispersed in the world. In North America they abound. Coming to Europe, to the Alps, we find the alpine Rose. Travelling eastwards, the Rhododendron ponticum is found. Farther eastwards is the one well known for many years—the Rhododendron arboreum. Garden Rhododendrons are mainly descendants of this species and of American forms. Sir Joseph Hooker, in 1847 to 1851, on the Sikkim Himalaya Mountains, came across an enormous number of Rhododendrons of a totally different type from those from America. Mr. Veitch's travellers going further eastwards, found other species. The first in 1850, which was named jasminiflorum, was found in Malacca. It bore a slender flower, with a long tube and very small border. The next were discovered in Sumatra, the Malay Islands, Borneo, and Java. Mr. Veitch's grandfather first tried what he could do with these, taking the pollen of the orange broad-mouthed jaranicum, and placing it upon the stigma of jasminiflorum, the result of which was to produce one named Princess Royal.

Pollinating a pure white flower with pollen from an orange one has the effect of washing out (using the term metaphorically) the yellow, and producing a bright pink, the tube being longer, the border larger, and the shape of the flower prettier than the original. Taking the pink one, and crossing it with the jasminiflorum, it was found that the reintroduction of the white washed out the pink, and a form was produced almost identical with the pink, but pure white. From these an immense number of combinations have been started. It had been found that, in other cases, a combination of white with orange eliminated the yellow. Thus, the bronze Abutilon Darwini was the only one known for many years. Gardeners could do nothing with it till it was found that the white, when combined with orange, produced pinks and yellows. Though pink was usually the result of a combination of white with orange, sometimes the reverse takes place; white eliminated pink or red and left yellow, the pink only being seen in the anthers; in other cases there were crimson anthers with a crimson corolla. Taking *R. Lobbiai*, and combining it with the large yellow, the result is a crimson with a tube almost straight. Uniting pink with a bright yellow, the former is washed out, and the yellow left, the form being that of the pink original. It also not infrequently happens that two colours eliminate each other. Thus, crossing a pink with a golden-yellow sometimes produces a white variety, with a tube and form very much the same as in the yellow form. Taking a pink and combining it with orange, the same result is produced; the two original colours are eliminated, and a yellow produced totally different in shape from the original white.

Another effect produced by crossing is the restoration of colour. The effect of a combination of white with bright yellow is to eliminate the yellow and produce pink, although there was no pink visible in either of the parents, this colour being restored from the grandparent. It occasionally happens, however, that the result of pollinating is a hybrid exactly like one of the parents. Taking the white and using with it the pollen of the golden-yellow *R. Teysmannii*, the latter has been reproduced. This is an instance of pre-potency. There is another peculiar result from hybridising. Taking a large orange-coloured blossom of the third generation, and placing upon its stigma a tiny blossom of Malayanum, the result

is not distinguishable from the latter except in the leaf. A whole series, called the multicolor section, has also been raised by taking the pollen of a lemon and crimson-coloured species, and placing it upon crimson, and combining an orange with others, a corolla was produced much smaller than the original. Another effect sometimes happens, and a combination of two species produces a corolla larger than either.

In the course of his experiments, Mr. Veitch also found out this fact, which was confirmed in his experience of Orchids:—If one had, say, a group of Cyripediums from the Old World and a group also from the New World, although Old World hybrids could be raised with ease, there was difficulty in raising seedlings from a combination of species from the two worlds. So with the Rhododendrons. With the seven species mentioned, Mr. Veitch had raised, as he had said, 150 different forms, and there was no saying how many more might be produced; but when he tried to raise hybrids between these and others, he found the difficulties exceedingly great, succeeding in only one case, producing one which was practically the same as the East Indian one—pure white. Lately there flowered one which had been six years before flowering, and which was obtained by taking the common Azalea and uniting it with an orange one of the fourth generation. This produced two plants—one about a foot high, and the other 3 inches. The blossoms were orange-coloured, the flower being in texture more like those of the Azalea than the Rhododendron. It was often said that when two forms were united, the staminate gives the character of the flowers, and the one which bore the seed the character of the foliage, and that rule holds good in this case. But it is far from being the case when taking the broad view, and examining a large number.

In some forms the characteristic leaf is not reproduced. The rule breaks down entirely. Each transmits certain peculiarities, whether in corolla or leaf, according to some pre-potency. The reason for this can not be given. One other curious result: Mr. Veitch wanted to raise double flowers, but could never see his way, because no botanist could create anything, but had to wait till Nature showed a sign, and then he must be quick in detecting that sign. On one occasion, Mr. Veitch's foreman noticed one anther to be flattened out like a little petal. He took pollen from the other anthers on the same flower, and placed it on the stigma of that flower, and obtained from it fifteen seeds, which blossomed one after the other. A most curious thing was that many of these were double, some single, and some half-double. And thus an entire section, known as the Balsaminiflorum, was produced by self-fertilisation. One result of self-fertilisation in this case was that it differentiated the parentages, and at the same time doubled the whole of them. The result of uniting the doubles with the singles was to destroy the doubling, the hybrid becoming single, or nearly so. *George Henslow.*

ORCHID NOTES AND GLEANINGS.

LÆLIA GOULDIANA, *Rehb. f.*

Two fine racemes of this handsome *Lælia* have just been received at Kew, one coming from Mr. W. Stevens, Walton, Stone, Staffordshire; and the other from Mr. R. Johnson, Stand Hall Gardens, Whitefield, near Manchester. Not all the plants in gardens seem to be true to name, for on three distinct occasions ordinary *L. autumnalis* has been sent for the rarer plant. A question raised when the plant was described was, whether it was a genuine species, a variety of something else, or a natural hybrid. On comparing it with allied forms, I have arrived at the conclusion that it is a natural hybrid between *Lælia autumnalis* and *L. anceps*, having the general character of the former, but with the pencilling on the lip, and, to a smaller degree, the bracts and other unmistakable traces of the parentage of the latter. During a recent visit to Messrs. B. S. Williams &

Son's nursery, Upper Holloway, I was shown a coloured drawing of the original *Lælia* Crawshayana, which has evidently the same parentage, though it is just possible, as was suggested by Prof. Reichenbach, that *L. Gouldiana* may be the reverse cross. Another point brought out by the examination of the drawing just mentioned is, that the plant sent twice to Kew as *L. Crawshayana*, and on which I have already commented in these columns, is not the typical plant at all, though it is probably the variety *leucoptera*, described by Reichenbach. But this plant would appear to have a different parentage, viz., to be between *L. autumnalis* and *L. albidia* as previously pointed out; and therefore it should not be referred to as a variety of *L. Crawshayana*. This plant I propose to call simply *Lælia leucoptera* ×. One other combination is possible, viz., that between *L. albidia* and *L. anceps*, but I am not aware that such a hybrid has yet been observed. That plants of ordinary *autumnalis* should have flowered out a batch of supposed *Gouldiana* is not remarkable, especially if the latter is a genuine natural hybrid, as there is every reason to believe it is, for it is sure to be a comparatively rare plant, and is probably scarcely distinguishable when out of flower. It is certainly a brilliantly coloured and very handsome plant. *R. A. Rolfe.*

SOPHRONITES GRANDIFLORA.

This little gem is just now flowering very freely here. We grow it in baskets and pans suspended close to the glass in the very coolest house, where it gets plenty of light and moisture. It makes a pleasant contrast when arranged amongst the white forms of *Odontoglossum crispum*. *S. Cooker, Rosefeld.*

SACCOLABUM HENDERSONIANUM.

Amongst the small kinds, this is one of the prettiest, and deserves to find a place in every collection, however small. Its numerous flower-spikes and rose-coloured flowers, rare amongst Orchids, make it one of the gayest Orchids, either for the houses or exhibition. In travelling along the great rivers of Western Borneo during the months of June and July, their rosy flowers are to be seen from a great distance. They grow on small-leaved, sparse branched low trees, and mainly on the outer branches overhanging the water; many of the trees being literally covered with them, and sometimes young, strong plants send out a dozen straight-growing spikes of 6 to 8 inches in length. Abundance of light, and constant exposure to rays of the sun, seem to be essential to their well-being. During the rainy season—that is, from October until April—they are exposed to an almost incessant downpour, and for the rest of the year their roots endeavour to get their nourishment direct from the rivers, or conceal them beneath the mosses and Ferns growing around them. In cultivation the plants should be fastened to a block, and this should be suspended just above a water tank, but without bringing them too far from the glass. *C. Reichenbach, Singapore.*

CYRIPEDIUM INSIGNE.

Mr. Compland of the Hall Gardens, Penny Bridge, Ulverston, sent us a flower whose peculiarities seem worthy of notice. In an ordinary *Cyripedium* the two side sepals are, it will be remembered, not separate but joined, and not only are they thus joined, but they are as it were dragged out of position so that the upper sepal and the duplex lower one stand opposite the one to the other thus —. In the flower before us, the three sepals were separate from the beginning, and arranged in a triangular fashion as in most Orchids —. At the same time the two lateral petals instead of being directed horizontally, as usual, or having a slightly downward curve, were directed upwards, so as to fill in the gaps between the upper and the lateral sepals.

ODONTOGLOSSUM BEHRMANNI VAR. ASPERSUM.

This variety was named by the late Professor Reichenbach, but his description has not previously been published. It differs from the type in its free

growth and rather lax racemes of golden yellow flowers, beautifully blotched with purple brown. *Reichenbachia*, t. 79.

AERIDES SUAVISSIMUM AND ITS VARIETIES.

Aerides suavisissimum is a very handsome species, introduced from the Straits of Malacca by Messrs. Loddiges, which flowered in this country for the first time in 1849. It was described in the *Journal of the Horticultural Society* (vol. iv., p. 264) by Dr. Lindley. The sepals and petals were described as being white, tipped with lilac, and the lip pale bankin-yellow, with a lilac streak along the centre of the middle lobe. The flowers are borne in long drooping racemes, and exhale a very powerful aromatic perfume. The plant is somewhat variable in colour, and, unfortunately, it seems to have been greeted with a new name at almost every successive introduction, and to which circumstance perhaps may be attributed the fact that of late years it has been in a measure lost sight of.

The receipt of a very fine raceme, with a leaf from Mr. H. J. Ross, of Florence, has afforded me the opportunity of looking up the matter, and the result has induced me to pen this note. Mr. Ross's specimen was labelled *A. Rohanianum*, Rehb. f., but on comparing it with the description of that plant, and with several other forms which have received specific names, I have come to the conclusion that several described species must be considered as varieties only of *A. suavisissimum*. They are as follows:—*A. flavidum*, Lindl. in *Pact. Fl. Gard.*, ii. (1851—52), p. 101, a form with the segments of a very pale rose colour, which flowered in the collection of A. Kendrick, Esq. A. *Reichenbachii*, Linden, in *Koch & Fendler. Wuchenskrift*, 1858, p. 61, a form with the segments white, spotted with amethyst, the lip white, with yellow side lobes, and a green spur. Introduced from Borneo. Figured in *Yenia Orchidaceae*, ii., t. 101, also in *Lindleya*, t. 1, the latter figure, however, more nearly resembling the typical *suavisissimum*.—*A. nobile*, Warner, *Select Orch.*, ser. i. (1852—53), t. 11, a fine form, with pale flowers very closely resembling *A. flavidum*. There is also a poor figure of it in *Gartenflora*, t. 641.—*A. Rohanianum*, Rehb. f. in *Gard. Chron.*, 1884, pt. 1, p. 206; a form described as having the segments white or rose, or rose-mauve, and always with a white border; the lobes of the lip white, the spur sulphur, orange-coloured, with numerous small spots; the horns inside the lip are also said to be somewhat peculiar, but I can see no difference between them and those of *A. suavisissimum*. Of *A. suavisissimum* there are figures in Paxton's *Flower Garden*, ii., t. 65, and in *Lemaire's Jardin Fleuriste*, ii., t. 213, both of them differing as much from the form originally described as do some of the above forms from each other. The form figured in *Lindleya* is said to have been imported from the Philippines, so that the species appears to be widely diffused. Lindley called it "the sweetest air-plant," and, in addition to its delicious fragrance, its long and dense racemes are certainly very handsome. *R. A. Rolfe*.

LALIA ANCEPS AND ITS VARS., AT "THE DELL."

It is always a pleasure to go through Baron Schroder's Orchid houses and see the magnificent collection of plants at certain times when they are in bloom. A most effective display is made by the varieties of *Lalia anceps*, whose masses of large flowers look very gay. One of the least known and most distinct varieties of *L. anceps* is that known as *ambalis*, which was described for the first time in the *Gardeners' Chronicle*, for Jan. 25, 1889, by the late Prof. Reichenbach. The flowers are lovely, the sepals and petals being of the clearest white, sometimes faintly flushed with rose; the lip is remarkable for the conspicuous crimson streaks on the side lobes, and the mauve-purple blotch on the middle lobe in front of the bright yellow callus, which is lined with purple down the centre. *L. a. Percivaliana*, with its white lilac-flushed sepals and petals, and the deep magenta front-lobe of the lip, was highly attractive; also some wonderful specimens of *L. a.*

Dawsoni, and *L. a. Sanderiana*—these two last producing immense flowers, remarkable for the purity of their colouring. *L. a. Williamsii* has very large flowers which are almost entirely white, except for the yellow disc and purple streaks on the side-lobes of the lip. Among the other varieties that were noticed, were *L. a. Hilliana*, with white sepals and petals, and a faint mauve flush on the lip; *L. a. albi*, with flowers wholly white were it not for the yellow disc; *L. a. rosea*, with white flowers tinted with rose; and the very distinct but rather rare *L. a. Barkeriana*, with its very deep rose-purple flowers. *Visitor*. [Figures of most of these varieties were given in our 1st volume for 1887.—Ed.]

NEW YEAR FLOWERS AT BURFORD LODGE.

On New Year's Day an inspection of the gardens of Sir Trevor Lawrence, Bart., M.P., revealed a rich display of flowers in the renowned collection of Orchids, and other departments under glass, and notably the rich collection of Anthuriums, which occupy almost all the space of two houses, and the various species of winter-flowering Begonias. The hybrids of *Calanthe* have been in fine order the whole winter, and still the successional plants of *C. Veitchii superba* × *C. Veitchii lactea* ×, a clear white-flowered form, and *C. Sedeni* × with its rich crimson eye, offer sufficient beauty where a selection of varieties may have to be made. With these, *C. rosea* ×, *C. porphyrea* ×, and others, obtained by Sir Trevor Lawrence, by crossing with *Limatodes labrosa*; some good forms of *C. Regneri*, and *C. vestita superba*, make a very bright display. The house of Mexican *Laelias* has a centre of attraction, a noble plant of the new *Laelia Gouldiana*, with ten spikes and about forty flowers, and of which an illustration will appear in these pages shortly. It is richly coloured, and the best of the dwarf *Laelias*. The *L. anceps* varieties are commencing to flower with the white *L. a. vestalis*, and other white forms; the true form of *L. a. Percivaliana*, *L. a. Hilliana*, *L. a. Dawsoni*, &c., being also among those which are already expanded. The fine dwarf *L. furfuracea* and a large specimen of the neat *L. albida* were in bloom, and in the same house was a specimen of the yellow-lipped *Obolontoglossum Londesboroughianum* now so seldom seen.

The *Dendrobis* in bloom consisted chiefly of hybrids, and many of them raised at Burford. Among these the crosses with *D. Fendlayianum*, and named *D. chrysoxanthum* ×, and *D. melanodiscum* ×, are very pretty; and apparently to the same section belongs *D. xanthocentrum* ×, a pretty variety, with the large labellum two-thirds yellow, and with but the faintest brown spot at the base; the beautiful *D. micans* ×, *D. eusomum leucopterum* ×, *D. Dominicanum* ×, and *D. splendensissimum* ×; four *Veitchian* hybrids, and *D. rhodocentrum*, and others are in bloom.

One of the most curious features among the *Dendrobis* is the flowering together of the varieties of *D. nobile*, and which offers special facilities for comparing the flowers of the different varieties which have sported in gardens, viz., *D. nobile Tollianum*, which exhibits traces of *trilabellia*, and further has the peculiarity of always flowering with its labellum turned upwards; *D. n. Cooksonii*, which is a marked case of *trilabellia*, the petals partaking of the characteristics of the lip. To these may be added an extraordinary form now in flower, in which the labellum has merged into the lower halves of the two lower sepals, the *trilabellia* being shifted from the inner to the outer plane of segments.

Throughout the year there are *Cypripediums* in flower; and many of those seen were the *C. venustum* crosses, which, however, they may be despised when small and weak, make fine objects when their peculiarly large, shining flowers are strong. Among these are *C. pavonianum* × (*C. venustum* × *C. Boxallii*), *C. Meausuresianum* ×, *C. chloroneurum* ×, and *C. politum* ×.

Also in bloom were many plants of *C. callosum*,

C. nitens ×, and approaching it in appearance, *C. insigne Mooreanum* ×.

The cool houses have the usual *Obolontoglossums* just coming in, with plants of the rose-coloured *O. Cervantesii morala* of the Liverpool Horticultural Company; *O. Krameri*, *O. Rossii majus*, *Oncidium barbatum*, *Pilumna fragrans*, a single specimen of the orange scarlet *Epidendrum vitellinum*, and several fine *Sophranitis grandiflora*, some of them having thirty or forty flowers on a panicle. The *Mastovallias* also give their quota, with some large specimens of *M. tovarensis* and some of the scarlet species, and the curious *M. muscosa*, with its moving labellum, the singular *M. pulvinaris*; and with them *Pleurothallis ornata*, with upturned velvety black flowers, edged with white fringe, sensitive to the faintest breath of air.

The warm houses have in bloom several *Vanda Amesiana*, *Saccolabium violaceum*, *S. Harrisonianum*, *Paphia grandis*, *Spathoglottis Regnerii*, *Angraecum sesquipedale*, *Celogyne lentiginosa*, *C. speciosa*, and others; and among the old plants none are more beautiful than a raft covered with the dwarf *Epidendrum polybulbon*, whose flowers have yellow and chestnut petals, and a snow-white lip. Among these *Epidendrum prestans*, *Obolontoglossum cariniferum*, *Sophranitis violacea*, *Oncidium cucullatum*, *O. cheirophonum*, *Cattleya chocoensis*, and one of the finest forms of *C. Lawrenceanum* which has yet bloomed, are in flower.

THE COLLECTION OF ANTHURIUMS.

So ornamental in foliage and inflorescence, and especially of the rich scarlet *A. Andreanum* section, have noteworthy examples in *A. Laiugi*, with large white spathe, and dull rose-coloured spadix; *A. Lindeni*, white, delicately tipped with rose; *A. Edwardsii roseum*, and *A. Mortontianense*, both good; *A. Princess Clementine*, a white *A. Andreanum*, and several unnamed Burford seedlings of rich colours.

Among the *Begonias*, *B. John Heal*, which is pretty, and always welcome in winter, and the varieties of *B. nitida*, were the most attractive. Large specimens of the rich-coloured *Impatiens Hawkeri*, the blue *Tillandsia Lindeni*, *Senecio pulcher*, and other winter-flowering plants, make gay the houses in which Mr. Bain, who has so long been the gardener at Burford Lodge, takes such pride.

PYRETHRUM (INSECT POWDER PLANT).

The following compilation of particulars respecting *Pyrethrum*, the Insect-powder plant, will probably be interesting to those who know the value of *pellets cultures* in piling up little profits.

During the long series of desultory campaigns kept up by the Russian Government in the Caucasus, and resulting in the annexation of the country, the military cantonments simply swarmed with fleas like *Pharao's* frogs, these insects were everywhere, but were not as easily kept at bay. The floors of some of the tents seemed to be alive with them, and the men were at their wits' end to get rid of the pests. They so effectually banished sleep, that whole companies would prefer to lie in the open and take their chance of weather, rather than share the tents with the fleas.

Some of the Tcherkess prisoners, who knew the ways of the country better than their invaders, at last let out the secret of a plant whose smell was fatal to the lively flea; this was the *Pyrethrum roseum*. It did not appear to be in commerce, but was gathered up the mountain slopes at an altitude of 8000 to 8000 ft., whenever wanted, hung up to dry, and rubbed to powder between the hands. However, before long, the collection of plants became a regular occupation among the shepherds, and a Russo-Armenian merchant named Yumitkoff bought all that was brought in, and manufactured the powder.

From that small beginning arose a very considerable industry, the export tax upon which is a valuable item in the revenue of the province.

It is not quite clear whether the success of *P. roseum* as an insecticide induced trials on other allied species, or whether the mountaineers of Dalmatia had already knowledge of the properties of a similar plant. But ere long *Pyrethrum cinerariaefolium* was largely cultivated in the Littorale, and so anxious were the growers to keep the monopoly in their own hands, that all the seed sent out for sale to agents of other countries was carefully baked to prevent its germination. In 1856, M. C. Willemot commenced the cultivation of Caucasian *Pyrethrum* on a large scale in France. His plants were examined by Duchartre, and, not being recognised as a slight variety of *P. roseum*, were called by him *P. Willemotii* Duch. This accounts for the two synonyms in vogue.

For ourselves, it will be handiest to call the two species Caucasian and Dalmatian *Pyrethrum* respectively. Willemot recommends a somewhat open, dry soil, well-drained, and not too clayey in character, the plant being very ready to die when germinating in too much humidity, and easily killed when mature by water-logging the nursery-bed with careless irrigation. The seed is best mixed with light sandy soil, sown on the surface of a well-prepared bed, and covered with a thin stratum of sandy mould. A light rolling after sowing is beneficial. The bed must not be allowed to dry out to the shallow depth of the seed. In about thirty days the young plants make their appearance, and as soon as large enough to be handled, are transplanted 6 inches apart on a well-prepared bed. Three months subsequently they are re-transplanted at double the former distance. The plants bloom in the spring of their second year. Thus far for the French practice. Here the greater heat of our climate, and a little careful management, may ensure flowering the first season. The best rule will be to treat the plant in about the same way as we are accustomed to treat *Asters*, *Zinnias*, and the like.

In California the cultivation of the Dalmatian plant is carried on by a settler from Dalmatia much in the same way as Mr. Willemot has directed. A fine, loose, open soil with a little old manure, form the nursery bed. The seed is mixed with sand, sown on the surface, and raked in to not more than half-an-inch in depth. Too much water will destroy the seed. Weeding and transplanting in damp weather, when about a month old, concludes his directions.

Of the two species, *P. roseum* is by far the more showy. Its flower is not at all unlike a rather poor *Aster*, the rays varying from pinkish-white to deep blood-red. The leaf is cut like a Fern. *P. cinerariaefolium* is white-flowered, and has a considerable resemblance to the *Lasioppermum*, or Cape white Camomile-weed, which covers outspans and roadsides, having a yellow disk and brilliant white rays, the underside of which is discoloured to a dull grey. The leaves are also Fern-like, but more coarsely divided than in the *P. roseum*.

In the manufacture of the powder the flower-heads must be gathered in fine weather, immediately on their opening, as that is the period when the essential-oil, on which its insecticide virtue depends, is most plentiful. They are then dried in the shade, where a draught of air can be secured. Exposure to the sun, to moisture, or to artificial heat, deteriorates the produce extremely. When quite dry they may be ground at once, or preserved in tin canisters till the whole harvest is ready for manipulation. The plants themselves are also cut to within 4 inches from the ground, and after drying are ground up. Of this inferior produce, one-third part by weight is added to the powder of the blossoms. There is no doubt that the Colonial snuff manufacturers could grind a better and more saleable article than could be prepared by any foreign appliances. Of course, a coffee-mill, finely set, will somehow grind the material, but as the effect of the powder depends to a certain extent on its degree of fineness, it would be a pity to lose the advantage to be got by the special work of the snuff-mill and graduated sieves.

It is not to be expected that *Pyrethrum* will be of

any great use as an insecticide in agricultural operations. Mr. Willemot, zealous to promote the new industry, proposed to protect wheat and maize from weevil by mixing ten ounces of his powder with ten bushels of grain. The effect would be scarcely appreciable. With bisulphide of carbon readily applied and certain in action, there is little reason to try *Pyrethrum*.

It has been tried in the United States to destroy insects in gardens in various ways, e.g., in form of dry powder puffed over the plants, in a mixture with water, and in fumigation. In all cases there is so much loss of the volatile oil by free contact with the atmosphere that its use can scarcely be said to be economical on any but a very small scale. *Roses* and *Cinerarias* may be cleared of aphid or green-fly by its means, but even in these cases the plan is amateurish, and presents no advantages over the old methods with tobacco water and tobacco fumigation. Domestic use as a safeguard against the lively flea is probably the proper outlet for the sale of *Pyrethrum*. *P. MacOweni*, F.L.S., Cape Town Botanic Garden.

abundant cellular matter in the shoots it is difficult of propagation; moreover, the petals have to be separated from the calyx by hand, which is not necessary with *R. alba* and *R. damascena*, thereby making its preparation more costly.

The hardness of the last two *Roses* is undoubted, for they come from the neighbourhood of the Shipka Pass (*Anglice*, wild Rose), where the Russian soldiers died in great numbers from the effects of cold. Moreover, the plants have undergone the rigours of a German winter last year without injury, although the temperature fell to zero, Fahrenheit.

The blooms are picked in the earliest hours of the morning, and sent off without delay to the distillers, who give in Leipzig 6*l.* per kilogramme of blooms, inclusive of calyx; and as between 250 to 500 of these go the kilogramme, and constitute the crop of one bush, the profits are considerable under intelligent care, on good soil. One Rose plant is allowed to 13 square yard = forty-four on 100 square yards, and will carry 250 blooms.

FIG. 7.—*R. ALBA* VAR. *SCAEVOLENS*. GROWN FOR ATTAR IN GERMANY.

ATTAR OF ROSES.

THROUGH the kindness of Dr. Dieck, director of the Arboretum Zoesehen, near Merseburg, Germany, we are enabled to give figures of two species of the Rose, which, owing mainly to his endeavours, have been introduced by him into the Fatherland from Eastern Roumelia.

Our readers are aware of the fact that all, or nearly all the attar of *Roses* consumed in Europe, came originally from that part of the Sultan's dominions. The exportation of cuttings or plants was rigorously forbidden by the Turkish officials, so that the acquisition of cuttings or plants in a living state was almost impossible; and it was only when many of the Mahomeddar, Bulgarians and Roumelians migrated from their homes into Asia Minor after the late war, taking their beloved *Roses* with them, that it became possible to hoodwink and trick the officials, and send packages of cuttings, &c., to Zoesehen. The Kazanlik *Roses*—that is, *Rosa alba* var. *suaevolens* (fig. 7), and the red *R. damascena* var. *trigini tipetala* (fig. 8)—are the *Roses* which stand highest as attar (oil) producers, although there are others grown by the peasantry in Koumelia and Bulgaria. We may mention the fact that the well-known *Rosa centifolia* gives sparingly a delicious attar, but that owing to the

HARD-WOODED GREENHOUSE PLANTS.

THOSE of us whose gardening experience dates back long enough, can well remember how popular hard-wooded greenhouse plants once were, and how proud those gardeners used to be who succeeded in growing better plants than their neighbours; and it, indeed, was a creditable performance for a gardener to produce a collection of Cape and New Holland plants in good condition and well flowered. Fashion has changed in respect to many of these subjects, and has pushed many beautiful plants, once much grown, into the background; but they will, I think, again come to the front when their decorative value shall be fully realised. The leading trade growers are apparently aware of this fact, and will not lose sight of the best things. Some of the old favourites are quite as popular as they ever were, notably the Indian *Azaleas*, which are amongst the best of the hard-wooded plants, and no one will venture to assert that they have not great beauty and are popular.

Cape Heaths, with their delicate pearly blossoms, are grown in most gardens, and those which flower in winter are grown and sold by tens of thousands; but even with all the Heaths, greenhouse *Azaleas*,

and Rhododendrons, Hippeastrums, and other popular plants thrown in, there are no truly blue flowers amongst them. There is supposed to be a blue Hippeastrum [Griffinia?], but it will, I fear, be just such a mythical plant as the blue Chrysanthemum. H. Rayneri is supposed to be the plant, but its flowers, as coloured in the *Botanical Magazine*, t. 5883, are more of a rose than purple tint. [Amaryllis Rayneri is a synonym of Hippeastrum procerum.] Those who have the plant find a difficulty in blooming it; therefore, if we want blue or purple flowers, we must grow those named at the head of this paper, and to them might be added some of the beautiful floriferous greenhouse Statives, such as the robust S. Holfordii and S. profusa, the last being well named, for the wealth of bloom produced by a full-grown plant is quite marvellous.

Pteronia elegans, a greenhouse plant of great beauty, is of free growth, and has been in cultivation in England for more than forty years. It was first discovered by Mr. Gardner in the Organ Mountains,

care being taken that there is a little fibre in the loam peat. We must not forget that "as the twig is bent the tree is inclined," and we must set about training the plants carefully from the first. This one and many other of the same character should be trained in the form of a spreading bush; and to do this, the young shoots, which will develop rapidly, must frequently have the points pinched out, and the growths be tied out laterally, and not twisted round sticks as is sometimes done, and other unnatural modes of training should be avoided. In their early stages of growth, the plants will push freely if placed in a temperature of 55°. Keep them near the glass so as to develop short-jointed shoots; they will flower nicely on second year's growth. When well established, they require re-potting once in a year, and a good time to do so is when they pass out of bloom. The re-potting must be done with care, and the potting material should be of the best; tough fibrous peat and loam torn to

plants of any kind, they should always be placed near to the glass in a house which is light and airy, not too closely together, and above all not crowded by Pelargoniums, Cinerarias, &c., or other soft-wooded plants. There is often a serious error committed by persons who have but one or two greenhouses, and are anxious to do as much as they can with their resources, for they not only overcrowd the plants, but mix hard and soft-wood plants together in indiscriminate fashion. Failure is then certain, unless very great attention is given to them.

Lasiandra macrantha has even more beautiful flowers than the above plant, but it requires a rather warmer temperature, and I am not able to induce it to make a floriferous specimen plant. The variety L. floribunda will blossom in small plants, and it is one that should not be neglected. It requires with a warmer temperature much the same kind of treatment as the first-named.

Hovea Celsii, an Australian plant, should be in every greenhouse, for its deep purple-blue flowers on slender stems are sure to please. We have here a plant that is about thirty years old, which has flowered freely every year since the seedling state. It does not form a self-supporting bush, and when its shoots are twined round a few sticks, or are dwarfed by being bent down, the character of the plant becomes lost. I now allow the growths to run up in their own free way, cutting the plant down when it has flowered out. It is best propagated by seeds, and flowers when quite young. Another beautiful plant from the same continent is the blue-flowered Leschenaultia biloba major, a really greenhouse plant, and one which may be propagated freely enough from cuttings treated like Pteronia. It used to be considered one of the choicest of exhibition plants, and I well remember Mr. J. Fraser, Lea Bridge, exhibiting a beautiful specimen at Regent's Park on almost the last occasion he sent his grand specimens for competition; but it has gone into the limbo of forgetfulness with the Epacrises of 6 and 7 feet high, and as much through. [It is still well done by Mr. Balchin, of Hascock's Gate, Ed.]

The Leschenaultia can not be grown into an immense specimen; but well-grown examples of 2 feet high and as much through were appraised at their true value, both by exhibitors and judges; no other hard-wooded greenhouse plant has such beautiful blue flowers, or is so effective for the greenhouse or at exhibitions. The slender growths are deep green in colour, as are the small leaves. The plant is liable to green-rot, and the shoots may be covered with them before the fact is noticed. The shoots are of more upright habit than some other species of the same genus, and require more care in training, as they are very liable to snap off.

The Statives are some of the most useful plants for exhibition and the greenhouse, the small blue flowers, with their pure white corolla, being very effective. S. profusa is more to be depended upon for exhibition purposes; but S. Holfordii is a more noble looking plant, and should be started in the warm-house in the spring with the Pteronias. Statives require ample pots in which to grow. J. Douglas.

FIG. 8.—B, GALICIA VAR. IRDO-INDIPETALA, GROWN FOR AFFAIR IN GERMANY. (SEE P. 41)

but Messrs. Veitch & Sons were the first to introduce it into cultivation, through their collector, Mr. W. Lobb. It will live and thrive in a greenhouse all the year round, but we obtain the largest and finest flowers when the plants are started in an early vinery at the same time as the Vines, the extra heat afforded giving the plants a better start; and they develop better at a later period in the greenhouse, the plants being placed in the greenhouse just before the flowers open. The old plants are apt to have long naked stems in course of time, but they will usually, with good management, have a presentable appearance for at least six years. The plant is easily propagated from cuttings taken in July, which strike freely if placed in a pot, covered with a bell-glass, on a shelf in the greenhouse. The cuttings should be of the same season's growth, and taken before the wood has become very hard. From six to nine cuttings may be inserted in a 3-inch pot, a compost of two-parts sandy peat, one part loam, and silver sand, if necessary, should be employed. The cuttings will push forth roots, and may be potted towards the end of September, potting being done in 3-inch pots, the compost being the same as that in the cutting pots,

pieces by hand being best, some sharp sand added to the whole, and if small lumps of charcoal be interspersed through the potting material, the results are beneficial. The plants, it may be said, do not need a large shift, and a change from a 7-inch pot to 9-inch one, or from a 9 to an 11-inch will be usually sufficient to secure good growth. The mass of soil should be in a moist state before being turned out of the old pot. Press the soil rather firmly in around the ball of roots, and do not water the newly potted plants for three or four days. After the re-potting, the plants should be kept in a closer place for a few days, and if the air gets dry, sprinkle the paths of the house two or three times a day with water. In summer or early autumn, new roots speedily push into the new compost; but if the plants are watered at once after the re-potting, and the new soil should thus be made too wet, it will sometimes become sour, with the consequence that the plants will not do so well as would have been the case had the roots pushed out into the new soil before water was afforded. It may be desirable to very lightly sprinkle the plants with a syringe, if the weather be warm and dry. In growing these, or, indeed, hard-wooded

TREES AND SHRUBS.

PYRUS JAPONICA ALBA.

I wish to put forward the claims of this plant for culture in pots in a cold-house during the winter. I am referring to the pure white variety introduced by Messrs. Veitch & Sons some time ago. A plant of it in a pot that stood out-of-doors all the summer and up to the end of November, is now in bloom, the blossoms of the most snowy whiteness, and though the plant is small, they are freely produced. It is in a cold-house, and therefore helped only by such fugitive solar heat as can be captured by the glass at the end of December and early in January. It will go out-of-doors again as soon as possible, for I find it is very subject to blight in the young foliage, if kept under glass too long. R. D.

PHILADELPHUS LEMOINEI X.

The result of a cross between *P. microphyllus* and *P. coronarius*. The plant forms a compact, nearly spherical mass of foliage, as wide as it is high. The leaves, which are narrowly oval, are about one quarter the size of those of *P. coronarius*, and nearly five times as large as those of *P. microphyllus*. The flowers are large, with spreading petals. It is very free-flowering and fragrant. It was raised by M. Lemoine, of Nancy, and is described and figured in *Garden and Forest* for December 25, 1889, by Prof. Sargent.

HARDY TERRESTRIAL ORCHIDS.

CYPRIPEDIUM spectable when well grown and bloomed always repays the cultivator for his trouble, but it is only one amongst many other easily grown Orchids. I have succeeded with this and others, potted and plunged in cocoa-nut fibre, in a cold frame, fixed to a north wall, the plants being watered when the soil got dry, and the sashes were put over them in winter and removed entirely between June 10 and November 1.

The following method, whilst adhering to these lines, though it did not appear to improve the plants much, sufficed to bloom them well and many others. A cold frame 4½ feet in width, 2 feet high in front, and 4 feet high at the back, made with two thicknesses of board, with interstice of about ½ inches between the boards, was erected at the foot of a wall facing south east; the soil was taken out to the depth of 10 inches, and at the bottom 3 inches of coarse coal ashes were placed; then the space between the boards of the front and sides was filled up with fibre, and a layer of coal ashes was placed around the frame on the outsides, 3 inches deep, and of a width of 2 feet; the latter to form a walk, and to aid in keeping out severe frosts. The sashes of such a frame are better if they are hinged at the back. Sufficient compost suited to the needs of the different plants is then prepared so as to give an average depth of 13 inches. This may consist of two parts turfy peat, two parts leaf-mould, and one part sphagnum moss, with about one-sixth part of silver-sand. The peat to be cut to pieces roughly with a spade, all the fibre being retained; then the longer roots in the peat and the sphagnum moss should be roughly chopped up with a bill-hook, and the whole of the materials mixed well together and made into a bed, treading all firmly. It is in planting the roots that any difficulty will occur. Those species which have the most robust growth and tall flower spikes must be placed at the back of the frame.

The subsequent care necessary will consist during the growing season of watering each plant as may be necessary; some, such as the Ram's-head *Cypripedium* and the Coral-root, both from the Eastern States of America, will need careful treatment in regard to this, but the whole of the plants should be watered somewhat freely when growing, no harm following the practice if the drainage has been well done. During bright sunshine, in the forenoon of each day, and until the sun leaves the frame, some kind of partial shading will be requisite. It must not be forgotten, however, that terrestrial Orchids, hardy in this country, come from countries very dissimilar as regards conditions; thus, *Cypripedium spectabile*, and *C. pubescens* from the eastern United States perform, will succeed well together, under the conditions here given, as also will *Cynidium pulchellus*, and our native *Cypripedium calceolus*. Though, therefore, I have unquestionable proof that *Cypripedium spectabile*, as before noted, will succeed admirably even on a cold northern site in our climate, and where a limited amount of sunshine reaches it, I know well that sunshine in proper season and in moderation is the life of plants. Hence, in that aspect, and if shading, be well attended to, the species named, and others, may be successfully grown and bloomed. The gentle heat engendered within the

frame incites to vigorous growth, and maintains healthy longevity. During sharp frosts, it will be well to place a mat over the sashes and sides, or, as I have sometimes done with *C. spectabile* in a frame on a northern aspect, place a layer of a few inches of dry leaves over the roots. *William Earley.*

FRUIT REGISTER.

BRABANT BELLEFLEUR.

This is a most beautiful Apple in appearance, and a very desirable late kind, keeping well into May, without deteriorating to any great extent; and it is of excellent quality, and only wants to be seen, and its all-round qualities known, to be more extensively grown than it is at the present time. As a pyramid, it is not at all suitable, but in any other form it succeeds well, being a good cropper, and healthy grower, though not very strong. *G. Woodward.*

MRS. PEARSON GRAPE.

The white Grape next to Muscat of Alexandria in goodness, at this time of year, is undoubtedly Mrs. Pearson. Grown here in a house with Foster's Seedling, Mrs. Pince's Black Muscat, Gros Guillaume, Trebbiana, and Muscat of Alexandria, and which were started about the middle of February last, we find that the flavour is indeed very little inferior to that of the Muscat of Alexandria. This Vine is grafted on Raisin de Calabre, and it is a good grower and a free setter. In my opinion, Mrs. Pearson is the very best late white Grape in cultivation, and it should be grown in every place where white Grapes are required at a late part of the season. *H. W. Ward, Longford Castle.*

HENRY SHAW.

The Board of Commissioners of St. Louis have forwarded to us a memorial statement referring to the services and munificence of the late Henry Shaw, from which we extract the following:—

Henry Shaw, born in Sheffield, England, July 24, 1800, died at his residence, Tower Grove, August 25, 1889. He came to St. Louis in 1819, engaged actively in business for more than twenty years, amassed a large fortune during an active and honourable career, and retiring about the year 1840, devoted his time to travel, study, and other preparations for the scientific pursuits and public work which he subsequently undertook. Returning to St. Louis in the year 1848, he commenced the execution of his matured purpose—the establishment of a botanical garden for the adornment of the city of his home, the enjoyment of its citizens, the cultivation of taste, and the advancement of science. He erected his country residence within the garden grounds, and personally attended to all steps necessary in the development of his noble design. In a few years the garden grew into order and beauty, and finally matured into one of the most complete institutions of the kind in the New or Old World. He found his pleasure in this pure and elevating task, but the ulterior design, steadily adhered to, was the benefit of all classes of society, and the creation for the use of the present and future generations of an institution directly ministering to the growth of the city, and in aid of higher tastes and manners, and the spiritual elevation of society.

In the year 1868 he deeded, as a gift to the city, the land embraced in Tower Grove Park, the only conditions being that the city should provide means for the work of improvement, for the annual maintenance of the same, and that a strip surrounding the park should be leased for villa residences, the revenues from which should go towards the support of the Botanical Gardens. The actual land so dedicated to public purposes was 276 acres; and he designed the plan of the park, the work of improvement being carried out under his personal supervision—all these difficult and valuable

services being rendered gratuitously to the public. He lived to see the park practically completed, and he also donated for its ornamentation the beautiful statues of Humboldt, Shakespeare and Columbus, and the six busts on the lawns surrounding the Music Pavilion. His chief enjoyment was the park and garden, and the spectacle of the people of the city visiting the lovely scenes he had created was to him a bright and unfailing pleasure.

In addition to these remarkable acts of philanthropy and public spirit, he was the benefactor of various institutions of charity and learning, and an active patron of botanical science. Among his recent acts was the creation and endowment of a Chair of Botany in connection with Washington University, and the publication of the Botanical Papers of Dr. George Engelmann, edited by Professor Asa Gray, of Harvard, assisted by Professor William Tralease, of Washington University, and distributed to scientific bodies throughout the world by the Smithsonian Institution.

By his last will and testament, the Missouri Botanical Gardens are placed upon a substantial and immutable basis. His whole estate, less only individual bequests, is created an endowment fund for their perpetual maintenance, and under the management of a Board of Trustees.

REDLANDS.

[SEE SUPPLEMENTARY SHEET.]

In a former number we referred to the Orchids and Orchid culture carried on at Redlands, near Glasgow, and we have now the pleasure of describing in some measure the plants that come out so admirably in the ink photograph which forms the special supplement to this issue.

It may be stated that the house itself is 30 feet long by 20 feet wide, and 17 feet at the apex. It is span-roofed, and was constructed and used as ainery. The border for Vine roots was all inside, and when it was remodelled for plant growing purposes, the soil was not removed, consequently the ground area husbands an additional supply of moisture for evaporation purposes, and it plays very successfully into the hand of the culturist—much more so than the modern stoves with stone or concrete or composition flooring, which pleases the eye far better evidently than it pleases the plants.

The principal plants in the foreground comprise Anthurium Warroqueanum, with the pitchers of N. Hookeri, dangling as it were, as ornamental appendages between it and the eye line. Then immediately in front is the old but highly effective *Alocasia metallica*, with Lawrence's bearded Ladies Slipper (*C. Lawrencianum*), as it were, peeping out among its bronzy plicate leaves. Then to the left *Phyllotanium Lindenii*, with its cordate-sagittate leaves, beautiful in their variegation with the sprays of pinnated foliage of the admirable Weddell's *Cocos* as a setting, the whole confronted with a group of the variegated form of *Panicum*, than which there is not a more effective grass for decorative purposes after this kind.

Passing over the lesser dignified fry, all of which however help to make a picture complete, let us pay a compliment to Mr. George Russell, the gardener to Mr. J. B. Mirrilles, for the admirable manner in which he cultivates the various beautiful examples of *Nepenthes*. Not even in the Veitchian establishment could this be excelled, and the admirable way in which they have been arranged to form a feature for reproduction upon paper, adds to the value of the skilled gardener in his artistic arrangement. There is even a charm about the teak baskets hanging in mid air which give a homely character to the scene. Pitcher growers will not be slow in singling out the species. *Hookeri* comes singularly well out, and so do *Mastersianus* X, which colours magnificently near the light. We never saw this form, for instance, with such a piece of russet colouring—far more pronounced, in fact, in that way than a Royal George

Peach grown and finished on the open wall—as in the examples shown by Mr. Lindsay from the Royal Botanic Gardens, Edinburgh, at the Great Plum Congress; and on inquiry we found it was due to close proximity to the glass covering, which by the way induces the pitchers to distend as well. Then *N. sanguinea* is also to the fore with several of intermediate, and peeping out among its fellows can be observed the handsome *Veitchii*. This always reminds us looking at the lid of a full trimmed fancy coat-collar. It is, as we have already described in the *Northern Gardener*, p. 78, "a pale green pitcher, somewhat emerald-like with a well-marked prominent fringe down the centre, the expanded portion showing two broad prominent wings, pinked out like the breast of a shirt, after the starch and smoothing-iron have done their work; with a tiny ovate lid."

There is a large lot of plants in this house which fall behind those photographed—none more interesting than the *Rubiaceous Rudgea macrophylla*, a fellow plant, so far as leaves go, to the magnificent *Medinilla*, only it yields great umbels of Stephanotis-like flowers, which, Mr. Russell tells us, sometimes bring as many as from 300 to 400 on one umbelliferous head! Little wonder that Professor Bower and his students, notwithstanding the many things to be seen in their own Botanic Gardens, make an occasional visit here. *J. A.*

THE ORCHID HOUSES.

The first three months of the year are, as I have found the best for the repotting and rebasketing of Orchids, so far as the general stock goes; but when speaking of repotting Orchids, it is not to be implied that every one of them is to be shifted as if they were zonal Pelargoniums. It should be understood rather that no Orchid should be disturbed unless there is evidence that it requires, or will soon require to be repotted or basketed. Some growers repot cool Orchids at the end of the summer, but to the amateur in a small way, it is risky, as he cannot give his plants the careful extra care which their disturbed condition at that season demands, and any neglect in the matter of shading and watering, would cause them quickly to shrivel, and lose more in a week than can be made up in a year. I would advocate therefore, the commencement of the repotting in the early part of this month, clearing a space in the cool-house, where the work may be carried out unless there is a shed adjoining, which does away with the necessity of taking the plants into the outer air.

The *Masdevallia* should be attended to first, then the *Odontoglossums*, and afterwards the other cool-house plants; and it is well in the case of old plants of *Masdevallia*, which have formed dense tufts, to break them up, and if stock is not required, to place the different pieces in the same pot or pan, leaving a space of one inch, or thereabouts, between them. I have noticed that *Masdevallias*, and, indeed, any other herbaceous perennials, indoors or out, which has a tufty habit of growth from the centre outwards, if left undivided too long, deteriorates first in the quality of the flowers, and then frequently dies at the centre, decay often carrying off the entire plant.

For the repotting a heap of sphagnum moss which has been picked over, and a separate heap of fibry peat broken up by the hands, should be kept on the bench; the mixing of the proportions of each being done during the repotting, and not by mixing all the materials together beforehand. By keeping the materials separate, the sizes of the pieces of peat and their position in the pots and also that of the moss can be regulated at will. During the operation of repotting every care should be taken that the plants are freed from insects and dirt; and it is well to have a pan of weak tobacco water, or properly-mixed Fir-tree oil, at hand, in which to dip each plant after it is sponged over, and before placing it in the fresh pot. In repotting those which do not require breaking up, as little disturbance of the roots as possible should take place, the old material being carefully removed, and as carefully replaced with fresh. Every damaged leaf should be removed by cutting it away just above the joint at which it would fall off naturally. As *Masdevallias*, and many other evergreen Orchids, bear their leaves far too

long a time when under cultivation, turning shabby instead of falling off, as they would when growing wild, these are the leaves, which should be removed from the plants.

Orchids, after repotting, require much care in watering, so that while the materials are wet enough to preserve the plants, they are not so wet that they would be spoiled before the new roots take to them. *James O'Brien.*

PLANTS AND THEIR CULTURE.

STOVE PLANTS.—In continuing my notes on the inmates of the stove, my aim will be to relate as fully as the space at my disposal allows, the treatment which I have found to be the most successful in regard to them. It is frequently noticed in gardens that many plants are grown in temperatures quite unsuited to their needs, and in soils in which the roots can scarcely exist. It should be the study of every young cultivator to learn, so far as there may be necessity for his so doing, the natural habitats of each, and to adapt his practice in some measure to those conditions. [See our leader of this and last week, &c.] Some plants are kept in a growing state the year round, when rest would be beneficial to them. I have incalculated during the past year the cultivation of healthy robust plants, and frequent propagation, as well as insisted on due attention being paid to small details of management for keeping large plants, in vigour, such as frequent cleansing, good drainage, and manuring when necessary, to encourage growth. Large plants often possess large quantities of roots, and the soil soon gets impoverished, needing supplies of manure in some form to get it to perform its work. The large plants at *Sion* are dressed with Clay's Fertiliser once or twice a month, and in the summer still more frequently; and many of them have not been repotted for years, so that it would result in disaster if root-feeding were overlooked.

The temperature of the stove should now be kept at its minimum, 60° at night being sufficiently high, a rise of 10° during the day being permitted, and, in the event of severe frosts a slightly lower temperature will do less harm for a short time than the excessive drying of the fires. All hot-houses are the better for being covered on the lower part of the eaves and front lights, and if the whole roof could be covered it would be much better for the plants, as moisture would not condense on the glass, and the air would be moister, and less heat needed. The top ventilators should be opened a little when the weather permits this being done.

Tubers and Bulbs.—Plants at rest will require to be examined to see that they are not suffering from over-dryness at the root. *Gloxinias* and other tubers should not be allowed to shrivel for want of water; but they should be thoroughly watered and then replaced in their resting quarters. A few of the tubers which have started into growth should be placed on bottom heat near the light. Early in the month, seed may be sown to supply flowering plants after the old tubers are over.

Amaryllis callica if it has had a long rest in a cool house will now furnish bloom if placed in the stove, the plants being repotted when done blooming, and at that time the division of the bulbs may be undertaken. For potting soil, use loam with plenty of fibre in it, decayed cow dung, coarse sand, and adding a few lumps of charcoal. For large bulbs, 3-inch bones may be placed over the crocks, and a small quantity of bone dust added to the compost. Some of the hybrid varieties may be placed in heat, those commencing to grow being first taken. We place our bulbs on a warm stage half plunged in coarse fibre, and close to the roof, and as the flowers open, the plants are removed to the drier and cooler part of the house. Bulbs which may be started at a later date may be placed in an intermediate house while in bloom. *Calanthes*, though classed as Orchids, may be grown in any hot house, and as soon as they go out of bloom the pseudobulbs should be shaken out, and stored in pans in dry sand or cocoa fibre, placing them as deeply as they were in the pots when growing, keeping them in the same temperature, and affording them a long rest-period. By this treatment, the young tender roots will be uninjured when potted up, and if the latter be carefully done, I find this plan a better one than dividing and shaking out the bulbs which have been rested in the pots. *Eucharis amazonica*, which may have been in bloom through the past month, should have encouragement to grow freely by keeping them near the light, and

affording them liquid manure occasionally if the pots are full of roots. *G. Wythes, Syon House, Brentford.*

THE KITCHEN GARDEN.

As soon as a change of weather takes place, and the ground is in suitable condition, a few rows of early Peas should be sown in some sheltered and dryish part of the garden, that which enjoys a southern aspect being the best. Of varieties to sow, *Veitch's Extra Early*, *Sutton's Emerald Gem*, and *William the First*, are excellent. Should mice be troublesome in the garden, first give the seeds a slight damping, and sprinkle red lead over them, it does no harm to vegetation, and it is seldom that mice attack them if the process of coating them with red lead is well done. At the same time a sowing either on turves or in 3-inch pots should be made, and placed in a newly started Peach house till the young plants break through the soil, when they should immediately be removed to a cold frame or pit where frost will not reach them, giving abundance of air at all favourable times so as to induce a sturdy growth. Any Peas sown in November, which may be peeping through the soil, should have a few crumbs of mould drawn up to them which will prevent damage by severe frost and wind, and as an extra precaution, a small quantity of leaf-mould should be scattered among the plants. Put the stick to the rows early, and shelter the rows from wind with Spruce or Larch twigs, sticking these among the sticks.

A sowing of Broad Beans may also be made, and for general use *Early Mazagan* and the *Green Windsor* are two of the best for early use. A few rows at this early date will suffice, it being not advisable to sow Beans on a large scale till next month.

French Beans.—As the days lengthen, these may be more successfully grown, and the best varieties to sow now are *Ne Plus Ultra* and *Osborn Dwarf Forcing*, and the first-named is a most productive cropper. If suitable pits are at command, Beans do well planted out singly at a foot apart, and they may also be sown in 60s, two or three seeds in each, and when 4 inches high, transplanted a trifle further apart, care being taken not to damage the roots when turning them out of the pots. A somewhat light fibrous loam, with a plentiful supply of rough, sweet leaf-mould, or spent Mushroom-bed manure, added, make a suitable compost in which to grow kidney Beans. Those who grow and fruit them in pots on shelves in vineries, &c., will experience more difficulty in keeping the plants free of insects than those who grow them in pits. Thrips and red-spider being the worst foes to the tender foliage, and are fostered by dryness at the roots, care must be taken to guard against this evil by copious waterings when the plants require water, and by over-head syringing morning and afternoon in bright weather, or when much fire-heat is employed. Beans to be grown in pots may either be sown in small pots, and transplanted, or they may be sown in bearing pots, these being three-quarters filled with the compost, pressed moderately firm before sowing. Pots should be thoroughly clean and well drained. A temperature of 55° to 60°, with a rise of 10° by day, with sun-heat, should be maintained.

Asparagus roots should be taken in in numbers sufficient to meet the demand, placing them closely together on a properly prepared hotbed, with a bottom-heat of 50° to 55°, and top-heat from 55° to 60°. Asparagus thus treated will have shoots fit for cutting in three weeks from time of putting the roots into the bed.

Scabbell will now force with ease, and when lifting the roots, all the strong things not wanted on the plants should be secured and tied up in bundles, for planting at the proper season. The thickest of these, if planted on well-prepared land, will make fine heads for forcing after one season. When preparing the pieces, which should be 6 inches long, care should be taken that the right or upper end is kept upward, and this is best done by cutting the tops straight across, and the bottom in a slanting direction.

If not already done, place some sets of the earliest Potatoes in boxes to sprout for frame and pot work. Place the boxes, which should be shallow, in a Peach-house or vinery for the present, giving the tubers a slight wetting occasionally. Lift and put in heat roots of *Surrell*, *Mint*, *Tarragon*, according to the requirements; shallow boxes are preferable to pots. Onions may be sown thickly in boxes for salading. *H. Markham, Mereworth Castle, Maidstone.*

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturalists.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be written on ONE SIDE ONLY OF THE PAPER, and sent as early in the week as possible.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY,	JAN. 14.	Royal Horticultural Society: Fruit, Floral, and Scientific Committees, at Westminster.
THURSDAY,	JAN. 16.	Gardeners' Royal Benevolent Institution: Annual Meeting and Election, at "Simpson's," at 3 P.M.

SALES.

MONDAY,	JAN. 13.	Dutch Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY,	JAN. 15.	Roses, Fruit Trees, Border Plants, Dutch Bulbs, &c., at Stevens' Rooms.
THURSDAY,	JAN. 16.	Japanese and other Lilies at Protheroe & Morris' Rooms.
THURSDAY,	JAN. 16.	Orchids in Flower and Bud, <i>Araucaria excelsa</i> , <i>Lilium auratum</i> , and other Lilies from Japan, at Stevens' Rooms.
FRIDAY,	JAN. 17.	Imported and Established Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	JAN. 18.	Roses, Fruit Trees, Border Plants, Dutch Bulbs, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—36°.7.

The Gardeners' Problem. [In continuation of his remarks in our last issue, Mr. DYER proceeds to discuss the question as to the extent to which the gardener may be guided in his practice by a knowledge of plant-structure, and of the conditions under which plants grow in Nature.]

Neither geographical distribution nor the study of natural physical conditions appear to me to be infallible guides, when we have to begin by widely departing from them. I do not say that when information about them is procurable, it should not be considered; but taken by itself, it will not ordinarily lead to success in the gardening art. We grow *Pleiones* pretty successfully at Kew; yet we have Sir JOSEPH HOOKER'S testimony to the fact that our treatment is widely different from anything that the plants receive in the Himalayas.

I shall no doubt be told that such facts as I have stated prove only "that the plants in question possess greater power of adaptation than was before suspected." I believe this idea of the elasticity of plant constitution obscures the real facts of the case. That adaptation goes on in Nature I do not for a moment doubt; but I believe it to be a comparatively slow process of the results of which in a given time we see but little. The real fact is that the plant as it occurs in Nature tells us but little of its innate capabilities. These it may unaided never be able to take advantage of, and they can only be revealed by experiment. The constitution of the indivi-

dual species, I am disposed to consider, singularly inelastic, and bounded by limits which are not readily broken down when reached. But it is evident that in a state of Nature they are very frequently not reached.

The struggle for existence may have driven a plant into a position where it is little able to do itself justice; it is not till it comes into the hands of the gardener that it will get a chance. *Plumbago capensis* will grow equally well in the stove, the greenhouse, and, in Cornwall, in the open air; it does not get drawn by the one extreme of temperature, or checked by the other. *Trachelospermum jasminoides* is another well-known instance; Mr. JOAN even grew it in the open air in the neighbourhood of London. It is not in these cases, to my mind, a question of adaptation, but of insensibility within wide limits to a range of temperature. An Englishman does not adapt himself to the climate of India, but he can tolerate it. On the other hand, if we try to grow a *Kentia* a few degrees below the temperature it likes, we signify fail, because the constitutional limit in this case is comparatively narrow.

If we trusted to natural indications, we might conclude that species of very restricted distribution would be exceptionally difficult to cultivate, yet experience rather proves the reverse. Two of the most local of known plants are *Wulfenia carinthiaca* and *Ramonda pyrenaica*, yet neither proves difficult of cultivation. If I remember rightly, the Chilean *Galinsoga parviflora*, so abundantly naturalised about Kew, is in its native locality a comparatively rare plant. Who again could predict, from the range in Europe of *Saxifraga umbrosa*, that it would become the London Pride of the back courts of the metropolis.

There is, however, one important piece of information which we can draw from Nature, and that is the period and conditions necessary for "rest." This is, after all, rather a negative than a positive fact. Rest is not growth or cultivation, but the abeyance of both. It is the hint to the gardener to stay his hand. But even here Nature has to be regarded sometimes with a spirit of incredulity. I used to wonder why there was such a prodigious quantity of the stems of that curious little Tree Fern, *Brainea*, in our museums. I found that, as long as we imitated the conditions under which it occurred on the sun-dried hills of Hong Kong, there was never any dearth of specimens for anatomical purposes. Now that we treat it in a perfectly unorthodox manner, we require the stems to carry their living fronds. As JOHN SMITH has stated in the place I have already quoted from: "The health of a general collection of tropical plants grown in a hothouse, will not allow us to put them under the influence of their natural dry season. The deviation from Nature has to be accepted."

But we are recommended to look for illumination to anatomical and structural characters. To say nothing of the fact that life is short, and that we want to grow our plants without waiting for the results of their *post mortem* examination, I am more than doubtful that if we did, we should be much the wiser. In the discussion on Professor FOSTER'S paper on *Irises*, a very competent authority, pointed out that "the circumstance that the common German *Iris* thrives so well in London gardens was readily explained by the direction and peculiar structure of its leaves." This is all very well, but as a matter of fact, these characters are shared by a large number of other species of *Iris*, and these do not

thrive at all in London gardens, or for that matter, as regards some of them, in any.

The fact is, that these anatomical and structural peculiarities of plants are for the most part what are called "adaptive." They have relation to the needs of the plant in Nature in the "struggle for existence." In cultivation this struggle is in abeyance altogether. The conditions of existence are for the most part entirely altered, and structure and anatomy are no longer closely adjusted to them. A knowledge of the one by no means leads necessarily to an elucidation of the other.

Nor are the relations of structure to function and to external conditions always a safe guide. One illustration must suffice. When describing the Bornean *Rhododendrons*, Dr. LINDBLEY remarked:—"It has been suggested to me that these fine plants will not prove cultivable because they are epiphytes. I cannot concur in this opinion. . . . BLUME tells us that the Java species are mostly 'parasitical on trees,' that is to say, epiphytes; and yet the *Rhododendron javanicum* is as manageable as *Rhododendron arboreum*. The probability is that they do not require to be treated as epiphytes, and that like *Orchids*, they will grow better if committed judiciously to the earth."

Here we find the skilled gardener deliberately setting aside the relations of structure to external conditions as soon as he had got hold of them. The fact is, that in dealing with plants under artificial conditions we have to go deeper—far, in fact, behind the superficial facts of structure. We come down, to use Professor FOSTER'S words, to those things in the plant which are undreamt of in the latest philosophy of our newest botany. We come down to those inherent and inherited properties of the protoplasm of the species of which the outward structure is only the envelope. Upon the possibilities and limitations of this inner constitution the gardener plays, as Nature has played; and the experience of each does not, in my judgment, much help the other. There are limitations of temperature, of light, of nutrition, of rest. As long as the gardener conforms to and does not transcend these he may do what he pleases, and it is perfectly immaterial whether Nature has given the sanction of her example beforehand. But in this matter the microscope will not help us. Optically, the protoplasm of a plant which requires stove treatment does not differ from that of an alpine. But the difference is there, though it does not, and probably never will, reveal itself to the eye. Cultural experiment is the only means by which, as far as I can see, it can be explored. We have struggled at Kew, as many *Orchid* growers have done before us, with *Grammatophyllum*. A happy inspiration led Messrs. BACKHOUSE to try it in a Cattleya-house, where it rewarded them by growing "like a weed." Where was the hint from Nature for such a treatment?

No doubt I shall be told that it is a very deplorable thing that the Director of Kew should set himself to run down botany. I do not, however, really do anything of the kind. I only rescue botany, and in some degree myself, from a false position. I say that the data of botany afford, at best, a very insecure guide to horticultural practice. The fact is well known, and professed, by botanists gain nothing by shirking its recognition. Is botanical study on that account to be excluded from horticulture? By no means. The truly successful gardener is a man of observation essentially. If his practice is empirical, he is guided at every point by what he sees, and by his reflections on what he sees. He must know, then, the meaning of what he is

STOVE-HOUSE AT REDLANDS, GLASGOW

looking at, and should have a general notion of the essentials in the structure and physiology of the plant. But a mere knowledge of botany will no more make him a good cultivator than a knowledge of osteology will enable a man to treat a case of typhoid fever. There is no commoner mistake now-a-days than to suppose that scientific knowledge is a panacea in itself. Its value lies in the habits of observation which it should stimulate, and the exercise of the reflective powers upon the results of observation. The ideal gardener's life should be one of continuous experiment, and anything more stimulating to the mental faculties it is difficult to conceive. He should not be deterred by botanical prepossessions. Mr. DARWIN often told me that he "loved a fool's experiment;" by this he meant an experiment in which he was guided by instinct rather than by experience. He never hesitated to run counter to accepted ideas, if he thought he could add anything to knowledge by doing so. A gardener, even if he be a "routine practitioner," who successfully cultivates a new plant under conditions far alien to its natural ones, has, in my judgment, solved no mean scientific problem. If he sometimes finds himself making "a fool's experiment," he may comfort himself with the thought that if any fool could do the same, only a wise man can get any good out of it.

I have occupied a great deal of space in saying all this. I could easily write a book about it. Perhaps some day I shall, and then if the Editor cares to print this, I will ask his permission to reprint it as an introductory chapter. *W. T. Thibetson Dyer, Royal Gardens, Kew.*

LINNEAN SOCIETY.—At an evening meeting to be held on Thursday, January 16, 1890, at 8 p.m., the following papers will be read:—1. "Life History of a remarkable Uredine on *Jasminum grandiflorum*," by A. BARCLAY. 2. "Certain protective provisions in some larval British Teleostei," by E. PRINCE, F.L.S.

NATIONAL CHRYSANTHEMUM SOCIETY.—A meeting of the General Committee took place at Anderson's Hotel, on the 6th inst., Mr. R. BALLANTINE, the Chairman, presiding. The minutes of the last meeting having been read, the Hon. Secretary made a report as to the appointment of judges at the centenary show in November next, and Mr. H. PAYNE, the Foreign Hon. Secretary mentioned some correspondence he had had with the Secretary of the late International Exhibition in Ghent. The Hon. Secretary announced the death of Mr. W. BLAKE, of Tibury Docks, a member of the committee, and also of the society for many years, and moved a vote of condolence with his widow and children which was carried. Mr. HOLMES reported that he had placed the probable dates of the Exhibition of Early Chrysanthemums in September next, and the Midwinter Show in January, 1891, before the manager of the Royal Aquarium at Westminster, and moved they be Sept. 19 and 11, and January 7 and 8, which was agreed to. Judges were appointed at both these exhibitions, and it was stated that the National Dahlia Society would be asked to nominate judges of Dahlias, as heretofore, at the September Show. The Hon. Secretary also reported that the October Show of the series promoted by the Royal Aquarium, would take place on October 15 and 16, and requested the Committee to define the classes in which prizes would be offered for October Chrysanthemums by the National Chrysanthemum Society. It was resolved that Japanese and Pompon varieties only be invited, and six classes were drafted for Japanese and two for Pompons, the Hon. Secretary being empowered to appoint on a sum not exceeding £20 in prizes in these classes. The Hon. Secretary announced that the annual general meeting of the members of the Society would take place at Ander-

ton's Hotel on the 27th, and reported that the accounts of the recent provincial show at Hull had been settled in a satisfactory manner. It was resolved that Mr. A. C. REESELL, of Birmingham, supply the medals of the Society, as last year. Eighteen new members were elected, including five Fellows; this brings the roll of membership up to 691. The Guildford Chrysanthemum Society, the Stamford and District Horticultural Society, the Isle of Thanet Chrysanthemum Society, and the Auckland Society of New Zealand, were admitted to affiliation. Mr. G. DRAIN, jun., was elected on the committee, in the place of Mr. W. BLAKE, deceased. The Catalogue Committee were authorised to proceed with the work of preparing a new catalogue as soon as possible. A vote of thanks to the Chairman concluded the business.

HERR ERNST BENARY.—Among the presents received by this distinguished German horticulturist on the occasion of his seventieth birthday, on November 10 last, was an album quite unique of its kind, containing the portraits of upwards of 500 of the principal seed merchants and horticulturists of the civilised world. This gift came to Herr ERNST BENARY both as a great surprise and inexpressible pleasure; and in all probability he is the possessor of a gallery of portraits no other horticulturist past or present has or can possess. To each donor of his portrait for this album, Herr BENARY has sent a highly finished cabinet portrait of himself as a souvenir of the interesting gift made by his sons, as well as the celebration of the fiftieth year of his connection with the Erfurt business.

FRUIT CULTURE.—The Drapers' Company have sent to the Fruiterers' Company a donation of £105 towards the fund initiated by Sir JAMES WHITEHEAD, the late Lord Mayor, who is the Master of the Guild, for the promotion of fruit culture in homesteads and cottage gardens.

GARDEN SCHOLARSHIPS. In connection with the Missouri Botanical Gardens, founded by the late Mr. SHAW, mentioned in another column, six scholarships are established for the instruction of young gardeners in practical and theoretical horticulture. During the first year of their scholarship, garden pupils will work at the practical duties of the garden nine or ten hours daily, according to the season, the same as regular employees of the garden, and will also be expected to read the notes and articles referring to the subject of their work, in one or more good journals. In the second year, in addition to five hours' daily work of the same sort, they will be given instruction, and will be required to do thorough reading in vegetable gardening, flower gardening, small-fruit culture, and orchard culture, besides keeping the run of the current papers. In the third year, in addition to five hours of daily labour, they will be instructed and given reading in forestry, elementary botany, landscape gardening, and the rudiments of surveying and draining, and will be required to take charge of clipping or indexing some department of the current gardening papers for the benefit of all. In the fourth year, besides the customary work, they will study the botany of woods, garden vegetables, and fruits, in addition to assisting in the necessary indexing or clipping of papers, &c., and will be taught simple book-keeping, and the legal forms for leases, deeds, &c. The course for the fifth year, in addition to the customary work, will include the study of vegetable physiology, economic entomology, and fungi, especially those which cause diseases of cultivated plants; and each pupil will be expected to keep a simple set of accounts pertaining to some department of the garden. In the sixth year, in addition to the manual work, pupils will study the botany of garden and greenhouse plants, of Ferns, and of trees in their winter condition, besides the theoretical part of special gardening, connected with some branch of the work that they are charged with in the garden. From time to time, changes in this course will be made, as they shall appear to be desirable, and an effort will be made to give the best theoretical

instruction possible in the various subjects prescribed; but it is not intended to make botanists or other scientific specialists of garden pupils, but, on the contrary, practical gardeners. *William Trelease, Director of the Missouri Botanical Gardens, St. Louis, Mo.*

MR. W. H. BAXTER.—It is now more than forty years since Mr. WILLIAM HART BAXTER succeeded his father as Curator of the Oxford Botanic Garden, an appointment he was a few years since called on to resign. Subsequently, and until the present time, he held the appointment of Superintendent of the University Parks. Our readers, many of whom are familiar with the sphere of work with which the name of BAXTER is associated, will regret as we do, to learn that he is now incapacitated by infirmity for the performance of his duties. For some time past Mr. BAXTER'S failing vision has been a source of much concern to his family and friends, and much sympathy will be felt for him in his affliction, which necessitates his retirement from duties with which, for many years, he has been so honourably associated. By a decree of Convocation, the University authorities have signified their appreciation of his long and valuable services by authorising the Curators of the University Chest to pay him annually the sum of £50; the Curators of the Botanic Garden and those of the Parks contribute equal sums of £20, which together constitute an annual pension of £100. We sincerely hope that Mr. BAXTER may be spared for many years to enjoy the reward he has gained, and which he so well merits.

WANTED, A PUBLIC HALL FOR HORTICULTURE.—The matter has been in the air for a long while, and there it remains at present. Mr. HUMPHREY tried to bring it down long ago. Messrs. CANNELL have just had their shot. Every one seems to think the thing ought to be done, and, moreover, that it can be done. We have received a communication on the subject from Mr. SMILEY HUMPHREY, and from which we take the following extract:—"We want a hall for horticulture. It should be in a central position, convenient for access from leading roads and railways, and the construction should adapt it for flower shows, dinners, and other festivals, committee meetings, offices, and perhaps a general mart or exchange for miscellaneous business, as, for example, the display of plants for sale, the accommodation of trading firms for meeting customers, and for housing samples, models, drawings, and other materials required in business transactions in connection with agricultural and horticultural industries. There would be needful two or three (or more) well-lighted rooms adapted for public meetings, in addition to one spacious and noble hall, lighted in the way of a picture gallery, with orchestral platform and such other necessary features as would render it complete for the convenience of flower-shows and festivals. Should the idea take shape, it will grow as the plan is developed, and it should be comprehensive as a place of resort for horticulturists, who only need some such centre of operations to assemble in thousands, where, as the case now stands, the *habitués* meet only in scores, and fresh faces are rarely seen. Country gentlemen, participating in the pleasures of the London season, would make a place in the list of things to be done of such an attraction as the hall would offer them, provided only the thing obtained success commensurate with the purpose in view. One of my friends, who has heard of my proposals, has made a public offer of a subscription towards the project. As a thing to be initiated by eleemosynary contributions, it should have no help from me, and I cannot imagine that many of my friends, to whom from time to time I have spoken on the subject, would put their hands to anything of that kind. There is only one foundation proper for a horticultural hall, and that is the commercial foundation. It must pay its way, or prove itself a mockery, a delusion, and a snare. I have not attempted any estimate of the amount of capital that would be required, but not having in view a cheap shanty or a

bad imitation of a railway terminus, I should say that a considerable sum would have to be invested, and business must be looked for to ensure reasonable returns. The £100 per annum now paid by the Royal Horticultural Society for occupation of the Drill Hall ought not to be taken into account in this connection. I may be outvoted any number of times, but I feel sure that were a door to open leading to something better, and within the Society's means, the exodus would be speedy and unanimous. The Society is growing, and should grow. If it can pay £100 now for a year's accommodation, the day should be near when it could as easily pay £1000. It is now what it has not been for fully thirty years—a horticultural society; and the public are now taking a new interest in its work, and are daily more and more disposed to assist it, as is ever the case with a good thing that inspires confidence. The activities of the horticulturists carry them to all the ends of the earth for places of festivity and business. There may be a good side to the discursive system that fixes an exhibition in this spot and a dinner in that, but a recognised and generally accepted central home would be an incalculable advantage to horticulture at large in the metropolis, and many sources of income would arise for a central hall that could afford accommodation for exhibitions, dinners, public meetings, and official correspondence for various institutions, both of London and the provinces."

DUTCH HORTICULTURAL SOCIETY.—At a meeting of this body, held on December 3, 1889, First-class Certificates were awarded to Mr. H. Y. Lemkes, Alfeu, for *Dracena idivisa*, with yellow bordered leaves. The plant was 1 metre in height; to Messrs. Groenewegen & Co., Amsterdam, for *Chrysanthemum Stanstead Surprise*; and for a *Cyclamen persicum*, with double and stelliform flowers. Second-class Certificates were given to Mr. O. Y. Quintus, Groningen, for a hybrid *Anthurium Andreanum*; to Messrs. Groenewegen & Co. for *Chrysanthemum Mrs. Heale* and *Mlle. Melanie Fabre*; to the Zoological Garden of Rotterdam, for a hybrid *Dracena* (seedling) shown as Zoological Garden No. 1. The Arboricultural Committee awarded a First-class Certificate to Mr. H. A. F. de Vogel, The Hague, for two new kinds of *Salix* for osiers. These had been submitted to the meeting of September 10, but had been referred for trial. A Second-class Certificate was given to Mr. A. M. C. Jongkind Coninck at Ded-nsvaart for a *Cupressus Lawsoniana crispa*. A First-class Certificate was given by the Vegetables Committee to Messrs. Shuis & Groot, Enkhuizen, for two new Turnips, introduced from Russia under the names "early flat red" and "Prince Engaltischeff." The dates for the meetings of the Committees in 1890 are: February 12, March 18, April 15, May 14, June 19, July 17, August 26, September 25, and November 12.

WARE HORTICULTURAL.—At a meeting of the above society, held on December 31, a paper on "Tomato Culture" was read by Mr. J. B. RING. An interesting discussion followed, and a vote of thanks to the Chairman terminated a successful meeting.

MESSRS. KELWAY & SON.—On the evening of the 3rd inst., Mr. W. G. KELWAY entertained the employees of this firm at a dinner at his residence, Brooklands. About 50 sat down, and a very pleasant evening was spent.

THE COBRA PLANT (DARLINGTONIA CALIFORNICA).—There is, Mr. F. W. BURDING informs us, just one remarkable specimen of this rare Californian Pitcher-plant at Mount Merriion Gardens, near Dublin, a short account of which may interest our readers. So far as is known, it is by far the finest plant in Europe, being now a mass of stout and healthy leaf-pitchers, 3 feet 9 inches in height, and nearly as much in diameter. It was a gift to Mr. DUNCAN WELSH as a small plant twelve years ago, and to him all credit is due for its present healthy

development and vigour. It is of added interest, as, having been a gift from Glasnevin, in the days of the late Dr. DAVID MOORE. The finest pitcher-leaf is 3 feet 9 inches in height, but three other pitchers are only fall short of that height by 3 inches, and another reaches 3 feet 3 inches. There are in all forty pitchers over a foot in height, and twenty or thirty under a foot in height, so that the 12-inch pan (12 inches by 7 inches) in which it grows is literally a mass of leafy pitchers. It has been photographed, and in a short time we hope to be in a position to illustrate it in these columns.

"THE FRUIT TRADE JOURNAL."—Under this title a new journal has been started which claims to be an "illustrated, technical, and perfectly original publication—the only journal of its kind in the world, and . . . therefore unique in every way." It is intended to serve the interests of the wholesale fruit trade and of the fruit preservers. It is to be published monthly during the spring and winter, and weekly during July, August, and September. The interests involved are so important and increasing so rapidly, that there is no doubt a niche to be filled, and we trust our new contemporary will fill it comfortably to itself, and with advantage to its clients.

THE CHRYSANTHEMUM FEVER.—"It is a fact, significant of the present tendency of horticultural fashion," says the *Garden and Forest*, "that the receipts from visitors at the Chrysanthemum exhibition held at Boston last month, exceeded the receipts taken at all the other exhibitions combined held by the Massachusetts Society during the year."

TRADE IN SEEDS WITH THE UNITED STATES.—We call attention to a classification of plants, vegetables, Potatos, and garden seeds (as we learn from a circular sent us by Messrs. R. J. Godwin & Sons, 45, Wall Street, New York), which was issued by the U.S.A. Treasury Department, under date March 25, 1887. The list of articles admitted free, or with some modification of import duty, includes farm seeds, cereals, oil-seeds, &c., but we select only those which concern our readers the most:—

CLASSIFICATION OF SEEDS.

"The following provision of the Act of March 3, 1883, and citations of rulings of the department thereunder, regarding the classification for duty of imported seeds, &c., are published for the information and guidance of customs officers and others concerned.

"Potatos, 15 cents per bushel of 60 lb.
"Vegetables in their natural state, or in salt or brine, not specially enumerated or provided for in this Act, 10 per cent. *ad valorem*.

"Garden seeds, except seed of the Sugar-beet, 20 per cent. *ad valorem*.

"The following articles when imported shall be exempt from duty:—

"Plants, trees, shrubs, and Vines, of all kinds not otherwise provided for, and seeds of all kinds, except medicinal seeds not specially enumerated or provided for in this Act.

"Plants, trees, shrubs, roots, seed-cane, and seeds imported by the Department of Agriculture or the United States Botanical Garden.

"Garden Seeds.—Under these and sundry unpublished decisions of the Department, the following seeds are now held to be dutiable as 'garden seeds,' at the rate of 20 per cent. *ad valorem*, under the provision therefore in Schedule N. T. L. 465: Artichoke, Asparagus, Balm, Beans (not edible), Beets (not Sugar-beet), Borage, Broccoli, Brussels Sprout, Cabbage, Carrot, Cauliflower, Celeriac, Celery, Chevil, Chicory, Chive, Collard, Coriander, Corn-salad, Cress, Cucumbers, Dandelion, Egg-plant, Endive, Hyssop, Kale, Kohl Rabi, Lavender, Leek, Lettuce, Marjoram, Martynia proscidiana, Melon, Mushroom-spawn, Nasturtium, Okra, Onion, Parsley, Parsnips, Peas (not edible), Pepper, Radish, Rhubarb, Rosemary, Rue, Saffron, Sage, Salsify, Savory, Scorzoneria, Seakale, Shalot, Sorrel, Spinach, Squash, Swiss-chard, Thyme, Tomato, Vegetable Marrow.

"Vegetables.—Beans (edible), Synopsis, 6948; Peas (edible), Synopsis, 7914; and Lentils, Synopsis, 8004; have been held to be dutiable at the rate of 10 per cent. *ad valorem*, under the provision in Schedule G. T. I., 286, for vegetables in their natural state. C. S. Fairchild, Acting Secretary."

ICE-FLAKES.—M. CLOS describes in a recent number of the *Comptes Rendus*, an interesting case of the formation of flakes of extremely thin and striated ice, arranged lengthwise along the stems of certain plants. The flakes were attached in a wing-like fashion to the outer surface of the wood, the bark being raised or split to allow of their passage. The phenomenon is attributed to the exudation in straight lines of moisture which congeals at the moment of exudation, the portions first formed being pushed outwards by those formed subsequently. The conditions under which this formation occurs are not accurately known. At Toulouse, where the occurrence observed by Professor CLOS took place, the temperature fell during the preceding night to 6° C. or 21° F.

A PORTABLE BOTANICAL PRESS.—Mr. H. HELBIG describes in a recent number of the *Pharmaceutical Journal* a herbarium press, much used in Germany, which is superior in many respects to those commonly used in this country. This press consists of two separate iron frames, each about 16 inches by 10. Each frame is filled with a network of iron wire, with meshes about an inch square. Two catches jut out from each side of one frame, small brass chains being fixed at corresponding points on the other, so that the links can be slipped over the catch. As soon as gathered, the fresh plants are laid on paper in the frames, and when the necessary quantity has been obtained, the frames are placed together with the plants between, and connected, the chains being pulled on to the teeth. Owing to the elasticity of the paper and plants, a pressure is produced more than enough to keep the links of the chains on the teeth.

Such a press is cheap, can be made by any smith, is neat, always ready for use, occupies very little space, and having a handle, can be easily carried about, so that the plants can be prepared and pressed at the place where they grow, thus giving the best chance of preserving them so as to retain their natural appearance. Drying goes on very quickly, the air passing freely through the wires, especially when hung up, while if it is necessary to apply heat, the moisture readily escapes, a great advantage over the presses with solid frames.

THE "BOTANICAL MAGAZINE."—The January number is of unusual interest. It opens with an excellent figure of the curious Guianan Pitcher-plant, *Heliophora nutans*, t. 7093, which Messrs. Veitch were fortunate enough to flower in June last. The earliest account of this singular plant is that drawn up by the late Mr. BENTHAM, from specimens found by Sir ROBERT SCHOMBERG in Guiana, at the base of the Koraima mountain, where it was rediscovered in 1881 by Mr. BURKE, who was collecting for Messrs. Veitch. The summit of this mountain was considered inaccessible, but Mr. IM TRUEN and others have succeeded in scaling it. Mr. IM TRUEN describes the plants as growing in wide-spreading, very dense tufts in the very wettest places, where the grass happens not to be long. The red-veined pitchers, its delicate white flowers raised high on red-tinted stems, its sturdy habit of growth, make it a pretty little picture wherever it grows; but it attains its full size and best development not down in the swamp, but up on the ledges of the cliff of Koraima, and even on the top (about 8000 feet).

Pleurothallis ornata, t. 7094, is a diminutive species of a genus which, though it contains 600 species, is for the most part destitute of attraction for Orchidists. The present species is of Mexican origin, and is remarkable for the fringe of silvery threads hanging down from the margins of the flower segments. Each of these threads (which are of equal length) consist of a single slender cylindrical cell a

little narrowed at the base, so that they vibrate at the lightest touch. Mr. FRANK OLIVEA has communicated some observations on the subject to *Nature*, 1887, p. 363. The plant flowered at Kew.

Protea nana, t. 7095, is one of Masson's introductions (1787), and is so attractive and striking that it is indeed surprising it should have been so long neglected. The inspection of the present figure will perhaps induce some of our plant-lovers to try their hand at its cultivation. Seeds could easily be obtained from the Cape, and the plant grown in a cool greenhouse.

Rosa herbertifolia, t. 7096, is the curious simple leaved Rose, whose construction and floral beauty attracted attention at the late Rose Conference (see *Gardeners' Chronicle*, 1889, vol. vi., p. 8, 9, figs. 1, 2, and p. 78, fig. 13). A summary of its botanical history and structure is given in the last part of the *Bulletin of the Botanical Society of Belgium*.

Iris (*Xiphium*) *Boissieri*, t. 7097.—A Portuguese bulbous *Iris* only known to grow on a mountain in the south of Portugal at elevations of from 2000 to 3000 feet. It is near to *I. filifolia*, but differs in having a small beard or fringe on the keel of the outer segments of the flower. It was first flowered in England by Professor FOSBERG, and since by Messrs. BARR & SON.

"HOME, SWEET HOME."—One of the prettiest booklets we have seen this year is entitled *Home, Sweet Home*. Under this not particularly original heading, Mr. FREDERICK FITZ, a son of the famous botanical artist, W. H. FITZ, has gathered together several appropriate verses by Mrs. HEMANS and other authors, and has illustrated each page with some pretty and artistic sketch, having reference to the subject. The little sea-scene illustrating the poem "Tis lone on the Waters," seems to us one of the best, while the only one to which the slightest objection can be raised is the rather depressing sketch of a robin about to enter a trap on which is suggestively written "The End." No publisher's name is attached.

PANDANUS ODORATISSIMUS.—This tree, supposed to have been introduced from India, is cultivated in damp valleys in Arabia, the male plant alone being grown. The flower-spikes are held in ocrean for their delicious fragrance, as well as for personal decoration, being thrust by the natives into their turbans like an aigrette. M. DEFFENS states that a large trade is done in these spikes in the markets of the district of Tehama.

CATHA EDULIS.—The leaves of this tree are chewed by the natives of Arabia as a stimulant, like those of the Coca in S. America. They produce a feeling of exhilaration, and enable the consumer to undergo prolonged exertion and fasting without inconvenience. At religious ceremonies and domestic festivities, says M. DEFFENS, the Ouat is liberally distributed among those present. The town of Aden alone receives every year more than a thousand camel-loads of dried branches and leaves of this tree, packed tightly in Palm leaves. The shrub is cultivated in the region where Coffee is produced, at an altitude of 1600–1800 metres. The tree would be worth introducing to some of our colonies as a substitute for Tea.

THE CINERARIA CENTENARY, AND OTHERS.—No one up to the present time has thought of instituting a Cineraria Society, or of celebrating the centenary of its introduction. Nevertheless, during the year 1788 the Cineraria was first made known in this country, as also were *Amaryllis reticulata*, *A. umbellata* (now known as *Cyrtanthus obliquus*), *Eucomis punctata*, and *Kolreuteria paniculata*. All these were found in cultivation at Kew by L'HERITIER when he visited this country in 1786, and were, with others, published in his *Sertum Anglicum* in 1788. The *Sertum* is devoted to the description and illustration of plants cultivated in gardens round London, especially those at Kew, of which he speaks in high terms. Of course the plants must have been actually

introduced somewhat earlier, but for centenary purposes a margin must be allowed.

CANADIAN FERNS.—Professor Lawson has published under the title of the *Fern Flora of Canada*, a little manual intended for popular use, and descriptive of the Ferns of the Dominion. The botanical details are given with great clearness, and made even more clear by a plate representing the distinctive characters of the twenty-five genera. Among the rarer Ferns is one which has almost a tropical look, *Adiantum pedatum*. *Schizæa pusilla* is another interesting species, whose relations are chiefly tropical. Of its kind this little book is one of the best we have met with. It is published at Halifax, Nova Scotia, by A. and W. MACKINLAY, but might probably be obtained from Messrs. WILLIAMS & NORWATE or other booksellers here.

THE FORESTS OF NORTH AMERICA.—Dr. MAYR, who is now in Japan, has published a treatise in German entitled *Die Wälder von Nord America*, in which he gives an account of the geographical distribution and climatal conditions of the forests, together with descriptions of the timber and indications of its uses. In the appendix are given schemes of arrangement of the species according to the structure of the wood, the peculiarities of the seed, &c. Numerous illustrations are given, but they compare unfavourably with the text. It is to be hoped that this book, which is full of interest for foresters in temperate countries, will speedily see the light in an English translation.

BULBS, PLANTS, AND SHRUBS IN FLOWER OUT OF DOORS AT BLACKROCK, CORK.—Mr. BAXTON HARTLAND, of Temple Hill, Cork, says in a communication that reached us on Thursday that the following plants were in flower at the above place on the 7th inst.: Daffodils, *Pallidus procox*, *Tazetta*, Scilly and paper white; Snowdrops of all sorts; Hepatica, the double red; *Tritelea uniflora*. In plants, Lenten and Christmas Roses in endless variety, particularly the first named, from Mr. ANTHONY HEND'S collection. There are all sorts of double and single Primroses, *Aubritia græca*, *Gentiana aculis*, *Violas* of sorts, *Iris stylosa*, *Schizostylis coccinea*, Emperor Stocks and Wallflowers. The beautiful *Prunus pissardi* is becoming full of buds, *Mahonias* of sorts, all in flower; *Prunus Maulei* and *Azara microphylla* are crowded with bloom. We shall have, says Mr. Hartland, 100,000 blooms open in the open air of Ard Righ Daffodil about one month from this date.

PUBLICATIONS RECEIVED.—*Cornwallis's a Winter Resort*. (Plymouth: W. Buxton & Son, George Street).—*The Roarers Year-Book*. Edited by the Rev. H. H. DOUGLASS. (London: BEMROSE & SOSS, 23, Old Bailey).—*The Garden Oracle*. By SHIRLEY HENNER. (London: *Gardeners' Magazine Office*, 4, Ave Maria Lane, E.C.).—*The Culture of Vegetables and Flowers*. By STURROCK & SOSS. Fourth Edition. (London: STURROCK, MANSFELD & CO., Limited).

NOTICES OF BOOKS.

PROFITABLE FRUIT GROWING, by J. Wright. (London: E. H. May, 171, Fleet Street).

This is the essay which was premiated recently by the Fruiterers' Company, and its sensible practical character justifies the award. It is free from exaggerations as to the profit to be derived from fruit culture, at the same time it is not too discouraging to those who embark in the business judiciously, and with knowledge of what they are about.

Fruit growing is, however, not so profitable as might be imagined from the prices, &c., quoted at the commencement of each chapter. Taking, for instance, Strawberry growing: in favourable positions, a fairly high profit may occasionally be realised; but then there are so many things which lead to failure,

that this is but a very speculative work. A very wet season spoils a great part of the fruit, or the bloom may get frost-bitten by late frosts; and during a hot, dry season the plants not unfrequently receive such a check that the following year they fail to bloom at all. Again, with Apples, which take several years to grow to fine trees that will produce a reasonable return, there are the usual late spring frosts, and the caterpillars, which not unfrequently cripple the trees for a couple of years; or the summer may prove a wet, sunless one, and, as a consequence, the wood does not ripen, and fails to produce flowers for the following year; then there are storms, which may blow the greater part of the most promising fruit off early in the autumn, and this must be got rid of at any price. It will be seen, therefore, that the fruit growers have much that is unforeseen to contend with.

In parts of Kent, fruit plantations consist of all the kinds of fruits worth growing, and are often the property of, or are farmed by, noblemen and others who have capital, and who can face these failures with comparative equanimity; but those having only fruit, and who are heavily rented and burdened with titles, no matter of what size their plantations may be, seldom attain independence; whilst, on the other hand, dozens become bankrupt. Judging from the accounts of fruit-farming we sometimes read in the newspapers, written, as these are in some cases, by those who have been getting a livelihood by it, it should be a profitable occupation; but is it so in reality? It is not a hard matter to make favourable deductions from exceptionally good seasons, but the real proof is in the average for a series of years. It is no uncommon thing to see in Kent much fruit of all kinds spoiled, the market price not being enough to pay for picking, to say nothing of freight and commission. Plantations in padlocks, hedgerows, &c., except of cider fruit, stewing Pears, or some kind of fruit of poor eating quality would be subject to constant depreciation, unless watched constantly.

Marketing fruit is a matter well deserving attention by all fruit growers. It is a fact that much fruit is sent to London of small size and inferior in quality, from old orchards; and when Blenheim Pippins fetch only 1s. a bushel, it does not say much for the fruit, or the profits.

As regards the cultivation and management of market fruits, the author's advice is plain and good, and growers of fruit would do well to read, and take note of much that he has written.

THE COMPASS PLANT.

The ornamental value of *Silphium laciniatum* has, I think, been somewhat underrated; indeed, when it is well grown it is a very striking plant, and flowering as it does, far into the late autumn, it is the more valuable. For sometime back, its stately inflorescences have been conspicuous objects in the back line of a rather broad border of herbaceous plants, where they have obtained a height of about six feet, from which numerous racemose panicles of large, soft yellow flowers diverge.

The ray florets are about two and a half inches long; but as the flowers are cup-shaped, they only measure three inches over as they grow. However, it is quite a striking plant, when with over a dozen of these developed on a single inflorescence, distributed over about half of its length, and clear above the radical leaves—which are about three feet high. The foliage itself is not without ornamental value; the leaves have a stout clasping stalk, which carries a deeply lacinate blade—nearly a foot over. And they are otherwise interesting, as according to some authorities, it is owing to their peculiar behaviour that the popular name of Compass plant has been given. The late Dr. Asa Gray said they presented their faces uniformly north and south. However much this may hold good in their native habitat, I cannot say, but as observed in the garden, the most common plan is for the leaves to be at right angles to each other, with their edges perpendicular; this,

if taken together with the statement of others—that the flowers open to the east, then it would, seeing that that point was determined, be a veritable compass-plant, comparable, by the leaves playing the part of the eard, with the cardinal points on which the magnetic needle indicates. Be all that as it may, the plant will in all probability be more in request for decorative purposes than as an auxiliary scientific instrument.

It is of easy culture, any good, rich garden soil will suit. It may easily be increased by division, but more rapidly by seeds, which may usually be obtained from William Thompson, of Ipswich. There are a few other species of *Silphium*, which might be grown where variety is desired, the best of which are, *S. terebinthaceum*, a somewhat similar plant to *laciniatum*, but with entire, deeply-toothed leaves, and smaller, darker-coloured flowers; *S. perfoliatum*, and *trifoliatum* are two other distinct species, but inferior to *laciniatum*. *F. R.*

FLORISTS' FLOWERS.

PINKS.

It is to be hoped that the effort being made to secure an exhibition or two of Pinks during the coming summer will not altogether fail. A revival of the culture of this fragrant flower is needed for its own sake. Its congener, the Carnation, has far outstripped it in the race of popularity, and that not because both are in flower at the same time, and therefore a surfeit of the scented *Dianthus* might be complained of, for the Pink blooms a month earlier; it is a hardy plant, will succeed in ordinary cultivation, and it is not usually grown in pots for exhibition purposes like the Carnation. It is customary to plant the florists' Pink out in prepared beds at the end of September or in October. A special compost is provided, the beds are raised above the ground level to throw off superabundant moisture; and the leading shoots of the plants are pegged down so that they may not be blown about by the wind. It is of little use leaving the purchase of laced Pinks until they spring, unless they can be had well established in pots, because the lacing on the petal edges of flowers produced by spring, transplanted plants is generally imperfect. In a suitable locality, where there is a comparatively pure atmosphere, and on an open spot, a bed of Pinks can be made a source of great satisfaction to the cultivator. Time was when Pink shows were fairly numerous in the South of England, but now, unfortunately, there is not one.

Thanks to Mr. James Thurston, of Cardiff, who has raised some very fine laced Pinks, I have a small collection, but I am wintering them in pots, in a raised frame, where there is a free circulation of air above and below. My soil is scarcely suitable for planting out in the open in autumn; and London fogs work such havoc, especially when accompanied by keen frost. My plants are well established in 48-sized pots; and at the end of January they will go into 32-sized pots to flower. They appear to do well in a compost made up of fibry loam, well decomposed manure, leaf-mould, and some road grit. The month of January is perhaps the most trying for Pinks in pots, but I am hopeful they will pass through it unharmed.

I am glad to find it is not the intention of the promoters of the proposed Pink exhibition to confine themselves to the florist's laced Pinks only. Not that it is difficult to procure a collection, but because there are among what may be termed the forcing, border, and cutting Pinks some very fine varieties of varying colours well worthy of cultivation. I may name a few of these, viz., *Ascot*, soft fleshy pink, and deep carmine centre; the highly fragrant deep rose-coloured *Anna Boleyn*; *Deby Day*, deep pink, laced with purple; *Lord Lyon*, deep rosy-purple—one of the best; *Mary Auberton*, rich ruby-red; *Mrs. Sinkins*, white; and its improved variety, *Mrs. J. M. Welsh*; *Snowdon* and *Queen Victoria*, also fine white varieties; and *Rose Perfection*, a charm-

ing shade of light cerise. This by no means completes the list, but it is a useful and obtainable selection. Once the plants are had, it is a comparatively easy matter to propagate them by means of pipings or cuttings taken about the time of flowering, placed in pots of sandy soil, and rooted under bell-glasses in a gentle bottom-heat. *R. D.*

NEW CHRYSANTHEMUM, MRS. S. COLEMAN.

My attention has been drawn to an article in the *Gardeners' Chronicle* of December 14, on *Chrysanthemum sports*, by E. Molyneux, in which he says that he "fears that 'Mrs. S. Coleman,' will prove less serviceable for exhibition than any of the type." Now in the interest of growers and exhibitors, I think the least I can do is to contradict that part of his statement, for I have been very successful in growing and exhibiting this variety during the past season, and I think that I may be in a position to describe it better than one who has not grown it, or very probably not even seen a flower of it developed from the crown bud, which, as most exhibitors know, is the best in incurved varieties, and are almost the only ones shown at the north of England exhibitions, and in the southern parts of the country, I shall not be wrong in saying that

FIG. 9.—ARNEBIA CORNUTA. FLOWERS YELLOW, PURPLE-SPOTTED.

seventy-five out of every hundred blooms staged are crown buds. The colour of Mrs. S. Coleman is a rich rosy bronze, with a beautiful deep yellow centre, a very full flower, and the form quite up to the standard of others of the Princess type. Apart from the description given by E. Molyneux, another authority, Mr. George Gordon, who mentions it in the *Gardeners' Magazine* of December 21, p. 813, may with safety be taken. In this note he wrote, "The flowers exhibited at Brighton were well shown. The Princess family is so well known amongst exhibitors, and the fact that Mrs. S. Coleman sported from the Princess of Wales is sufficient proof of its being worthy of recommendation. It is now being distributed by Mr. Robert Owen, of Maidenhead. *M. Russell.*"

CHRYSANTHEMUM ETOILE DE LYON.

This must, I think, be reckoned as the finest novelty of the year, but still it has received much adverse criticism owing in a great measure to the many defective blooms which have been observed, and those almost white in colour, and which conveyed no idea of the beauty of its true colour, lilac-rose, when the flower is in proper character. The reason why so many badly coloured and formed blooms have been seen this season is owing entirely to the fact that the flower-buds formed too early; the buds really should not be "taken" earlier than the middle of August, then the florets are broad and

strap-shaped, and have none of the quill-form seen in early developed flowers, and which caused so much ill-feeling to be displayed by growers. *E. M.*

CONTINENTAL NOVELTIES.

ARNEBIA CORNUTA.

This is one of the floral novelties in course of distribution by Mr. Ernst Benary, of Erfurt. It is an annual, obtained through Herr Max Leitchlin of Baden-Baden, the entire stock being in the hands of Mr. Benary. It is the first annual species of this genus. The plant attains to a height of 2 feet, is much branched, and furnished with linear oblong leaves. Its curious and beautiful flowers, expand daily in succession, and are produced on each branch. They are small, rich yellow, and marked with five large black spots, the latter turning on the second day to deep maroon. On the third day the colour vanishes, and becomes of a clear pure yellow. The plant blooms with unusual freedom all the summer. The flowers, when cut and placed in water, retain their freshness for ten days. The seeds should be sown in heat in February, and the plants planted out in the open ground at the end of April. It does best in an unmanured soil. *R. D.* [*Arnebia cornuta* was described many years ago by Ledebour. It has a curious geographical distribution, being found not only in Siberia, but in South Eastern Russia, Algeria, and Tunis. It is like *A. echinoides*, figured in our columns in 1879, vol. xii., p. 689, but in that species the spots only occupy the base of the petals. *Ed.*]

THE AMATEUR'S "BEESTON" GREENHOUSE.

The kind of greenhouse best suited to the wants of the amateur who keeps no gardener, is one that is reasonable as to cost, which shall not get easily out of repair, and which, while affording the needed protection to the plant within it, is readily ventilated and warmed. These points seem to us to be met in Messrs. Foster & Pearson's greenhouse, and as the top-lights are made on the old-fashioned plan, and, therefore, removable at pleasure by taking out the pin that fixes them on the iron rafters. They may be entirely taken off the roof for the full exposure of the plants—or for repairing and painting—a great point with amateurs.

The heating arrangements seen in the figure are those of a stove or forcing-house, and may be modified to fit it for any other kind of culture. It will be noticed that the air is warmed—in the winter at least—by being brought in contact with the hot-water pipes before it reaches the plants. This also admits of modifications, and for a greenhouse the pipes, as seen in the figure, would be much too near to the plants to be good. The woodwork is of red deal, and it is thrice painted. The height to the apex is 8 feet 1 inch, of the side lights 2 feet to 2 feet 3 inches, according as the house is 10 feet or 12 feet wide.

HOME CORRESPONDENCE.

ROYAL HORTICULTURAL SOCIETY.—I have been pleased to read in the *Gardeners' Chronicle* and elsewhere during the last two years the numerous grumbles, some sensible, some foolish, about the Royal Horticultural Society, as I have regarded them as evidences of the returning (may I not say returned) vitality of our Society; but hitherto I have refrained from answering any of them. Indeed now, I do not wish to notice grumbles, but only to set right a fact or two. A correspondent last week made several assertions in your columns, which having been inserted by, and passed without any note or explanation from the Editor, readers may well be forgiven for supposing to bear his own (or my) name, and yet he cannot possibly be unaware that many of them are

absolutely groundless. Your correspondent asserts that "members of the committees of the Royal Horticultural Society have to submit to a tax," and the inference obviously is that this tax has been imposed by the present Council. The assertion is absolutely groundless. It is true that at one time, when the Society was, perhaps, at its lowest ebb, outsiders who did not even belong to it were asked to help on its committees, but I trust the day may never come back again when the Society will not contain within itself amply sufficient material for its own committees. Your correspondent asserts, that "the right to nominate to vacancies" has been taken away from the committees; whereas, only twelve lines above, he himself proves that such "right" never existed, as he says that such pseudo-nominations had to be submitted to the Council for approval, and were not always approved. Hence it follows, that in those days, as in these, the Council nominated; but then, as now, were only too grateful to any committee or any individual who would "suggest" suitable names for the purpose. The more interest Fellows take—and "suggestion" means interest—the better the Council will be pleased. Next he asserts that the "special ticket to committeemen has been withdrawn." This is the exact opposite of fact. It has been retained.

insertion to Mr. Wilk's letter, but we demur to his conclusion that we are editorially responsible for the opinions of any correspondent. The complaint as to the tax, is, we believe, based on the fact that, by a comparatively recent enactment, all members of the committees are now obliged to be Fellows of the Society. Now that the subscription rate is so low, we do not think that this is a grievance worth mentioning in the case of horticulturists proper, but there are many amateurs and gentlemen unconnected directly with horticulture, whose assistance was most valuable as referees on certain points. These gentlemen gave their services like the rest of us, but with absolute disinterestedness. To refuse to continue to such gentlemen the small compliment implied by giving the privileges of a Guinea Fellow during their period of office, was to our thinking discourteous and ill-judged. As to the nominations to the several committees, the old practice, if we can trust to our recollection of a quarter of a century, was that at one of the last meetings of the year, the Chairman of each committee was instructed by the Council formally to ask the members present to suggest certain names to fill up the vacancies occurring by rotation or otherwise. These names were then submitted to the council. This practice we venture to think was a

to the charge. Touching your suggestion, that they be considered as a section of the Floral Committee, that is exactly what has been done during the past year; they have retained all their original rights of voting and acting with full powers on every matter brought before the Floral Committee proper, thus clearly showing that they considered themselves a superior sect, inasmuch as in effect saying they were competent to deal with everything brought before the committee; but the others, in fact the large majority, were only capable of dealing with some things. If they can put any other construction on their actions, I should be glad to learn how. To argue that the other members were not well acquainted with Orchids would be no answer to the charge, for surely the most rabid orchidist would at least admit that members are average horticulturists, and fairly capable of forming a correct opinion on plants in general, and therefore, if with the able advocacy of the orchidic members—together with the evidence of the subject before them—they then failed to see sufficient merit in it to justify an award. I think the Fellows and the public will be pretty well satisfied that no award was necessary. By the way, it will be highly useful if some one would point out a few of the most striking imagined miscarriages of justice before the Orchid Committee was appointed, they would be useful for comparison with the doings of the latter body since it was instituted. *Frank Ross.* [The Orchid Committee, we have reason to believe, was instituted by the Council at the wish of several representative Orchid-growers and others, who deprecate the formation of another special society, which otherwise would almost certainly happen. By meeting after the Floral Committee and inviting any member of that body to sit on the Orchid Committee, the difficulty, if it is one, might readily be surmounted. Ed.]

FIG. 10.—THE AMATEUR'S "REFSON" GREENHOUSE. (SEE P. 52.)

Next, "Admission to special exhibitions has been withdrawn." Again the exact opposite of fact; every committeeman has, as such (in addition to any tickets he may have a right to as a Fellow) a ticket presented to him admitting to all the Society's shows and exhibitions, in the Temple or elsewhere. As I am troubling you, I will venture a remark on almost the only real fact mentioned by your correspondent. He says, "the luncheon has been withdrawn." Quite true. Immediately on leaving South Kensington the Council dispensed with their own luncheon, and after a year's experience, finding that the attendance at Council meetings had not in consequence fallen off, they, a year later withdrew the "luncheons" from the committees also, thinking that if the Council can one day a fortnight go without luncheon for the sake of horticulture, so also can the committees. Since we left South Kensington, not one farthing of the Society's money has been spent on feeding the Council, the Secretary, or the Treasurer, who give far more of their time to the Society than the Committees do, and though no doubt it is pleasant to be lunched at a Society's expense, yet I do not believe that a single Fellow who has the Society's real welfare at heart, but will agree that it is far better—far more dignified—for them to work for their Society for nothing than to lay themselves open to the possible reproach of cavillers that they only do it for the sake of a luncheon. *W. Wilks, Shirley Vicarage, Croydon.* [We very willingly give

good one, as the committees are more likely to know suitable persons than are the Council, while the compliment thus paid to the committee, by the Council engendered good will and sympathy. The present council has throughout proved itself so desirous of meeting the views of the fellows, and has so very readily adopted suggestions that have been made, that we do not doubt that they will readily continue to give consideration to any suggestion for the good of the Society that is made, and so far from objecting to criticism, they will hail it as far more satisfactory than either indifference or indiscriminate laudation. Ed.]

—While agreeing generally with what Mr. C. Noble and Mr. R. Dean say respecting this body at p. 732, vol. vi., and p. 22, vol. vii., I should further like to ask the promoters of the Orchid Committee the reason why it was instituted and separated from the main body of the Floral Committee. I hope it will not be thought that I am asking the question in any captious spirit; on the contrary, I have every desire to see the matter settled amicably, but should they fail to adduce sufficient reason for its existence, then I fear that the other members of the Floral Committee, as well as those of the general public interested in horticulture, would have little alternative but to accept Mr. C. Noble's dictum as to "cliquism and exclusive dealing." However, now that the necessity for its existence has been challenged, I hope they will be able to furnish a complete answer

A CLASHING OF DATES.—I observe that the meeting of the Royal Horticultural Society in November next is fixed for the 11th of that month. On that same date the Kingston Chrysanthemum show is announced to be held, and it is also the first of the National Chrysanthemum Society's four days' Centenary Celebration at the Royal Aquarium. I think the Royal Horticultural Society will be the greater sufferer from this unfortunate clashing of dates, and I trust the Council will see its way to making its meeting a week earlier. So many fixtures by affiliated Societies are dependent upon that of the Royal Aquarium Show of the National Chrysanthemum Society, that the latter, having made public announcement of its date, cannot now alter it. Chrysanthemum shows are now so numerous, and so many have to be crowded into the small space of a fortnight, that it is impossible but that some should clash with others. *R. D.*

LARGE GOOSEBERRIES.—At a meeting of the Birmingham Gardeners' Association held on December 10, Mr. J. Pope in a paper on "The Big Gooseberry," mentioned some leading Lancashire prize varieties, and the excellent qualities of many of them, and pleaded for the Gooseberry being recognised more than it is as a dessert fruit. The variety, *Bobby*, was alluded to as being the heaviest berry exhibited throughout England this year, the weight being 29 dwts., but larger berries of other sorts have been exhibited, notably, *London*, exhibited in 1852, which was of the extraordinary weight of 37 dwts. 7 grains. *W. D.*

TUBEROSES FLOWERING A SECOND TIME.—Your correspondent, "A. P.," will scarcely find that the attempt to flower these bulbs a second time a success in this country, when we consider that we are not able to flower more than 75 per cent. of the average samples sent to this country. Could we induce bulb growth, then the chances would favour the attempt, but this, according to my experience, is exactly what we cannot do, and as the same bulb flowers but once, new bulbs being formed on the top of the old one annually, we are at a loss to know how to proceed. The bulbs, which usually form after the flowering is complete, are small, and flattened out, and bear some resemblance to the corms of *Glaucolius The Bride*, and quite different to the elongated bulbs with which we are familiar. We have nothing more thoroughly hardy than these, for I have known offsets to endure 22° of frost with impunity, fully exposed on the top of a rubbish-heap, and into which they had rooted freely. Some eight years since I planted a batch of these for trial, mainly offsets of large size, selecting a warm

border against a south-west wall, but they never made their appearance above ground, and the bed, after waiting several months, was planted with other things. What we lack is what the *Tuberosa* appears to enjoy—a hot summer. The importations of these now reaching this country are of better quality than those of the corresponding season last year. J.

FIELD MICE AND BULBS.—One of our borders skirts the edge of a wood, and is much exposed to the depredations of field mice, which come up from the damp cold meadows in winter to the sheltered woody valley which bounds our garden. The yellow Crocus bulbs are especial tit-bits for their winter meals, and these they mine for on a very extensive scale. On this border we have had to replace two thousand bulbs to make good a year's depredations. You may see neat round holes all along the bulb lines where the mice have sunk their shafts, and from these they carry galleries below in true mining fashion. In tidying the wood-larks yesterday, my men noticed a round hole, tunnel-like, at the root of a large *Sycamore* tree, where the roots forked, and here was a field-mouse's nest, which proved to be packed full of fresh Crocus bulbs from our autumn plantings. No doubt there are many such hoards in the wood, containing many hundreds of bulbs, if we could only find them. Gilbert White observed that his newly discovered field-mouse—*Mus minimus*—built its summer nest of grass or Wheat stalks, and in winter changed its quarters, and burrowed deep down in the soil. We have this mouse here, and it stocks these holes with our garden bulbs for use during the period of hibernation. This throws light also upon a subject that has often puzzled me—the distribution of bulbous plants over wide areas. There are places in our wood and meadows where flowers suddenly appear where we never planted them, such as Crocuses, Snowdrops, and Daffodils, and they are not likely to have come from seeds. The spread of Daffodils over a whole meadow is also frequently noted, and this cannot be wholly accounted for by seeding. I have come to the conclusion that a good deal of this transportation of bulbs is the work of the mice, rats, and moles—for their winter stores. We are constantly at war with these interesting thieves, and find the water-trap, with a revolving wheel, the most effectual. We frequently find three or four mice in one trap set over night. Spring traps are not desirable, as they catch the birds as well as mice. W. Brockbank, Brockhurst, Didsbury, Jan. 4.

GARDENERS' ORPHAN FUND.—It is generally understood when a man holds ideas that do not in any way coincide with the views held by the great mass of his fellows, that he must be insane, or at least that he has a mental warp; under such conditions, I fear that I must be classed with the insane. I have lately received the second annual report of this Fund, and I must say it fills me with astonishment to think, that having in so short a time since its foundation been able to invest £225 18s. 10d., the managers of the Fund have displayed such unbounded prudence that they have made allowances to orphans during the year past of £129 15s. Now what I want to know is this—have the managers of the Fund so little faith in the nature of the work they have in hand, that they cannot give their contributors and friends credit for any determination to go on aiding the cause, and that they must, in consequence, invest nearly all their funds, whilst the poor unfortunate orphans, for whom it has been subscribed, go minus. Surely no body of men can dream that the springs of charity and pity are going to dry up; rather let us hope they will increase, as surely they will in proportion to the amount of good that is being done; but let it only be understood that the end in view is to raise an endowed fund, and you may say good-bye to anything approaching the same devotion which has already produced such grand results, and though in the meantime I be classed with the insane, it will surely not be long before positions will be changed. G.

PLANTING PERENNIALS IN A BORDER.—I am much indebted to those correspondents who have replied to my inquiries on the above subject in your columns, and have found many hints of importance which my friend may be induced to put into practice. The remarks by "J.," p. 685, December 14, are in regard to some of them beside the mark, for he says that he would discard the border; now it was about the planting of a border that advice was needed. I do not say that beds on turf or gravel would be most effective, in fact, they would, but to be so they must partake of the nature of a border as far as regarded their contents,

if not in their form. If a bed of perennials is to be always gay during the flowering season, it must contain a mixture of plants, or it would at some season or other afford nothing to look at but fading foliage and seed-vessels. Certainly, when a bed is required to be at its best at any given time, it must be chiefly filled with those plants which flower at that season, and to plant many other things would be needless. This is a rule not often followed even in those places where the residents come and go at stated periods, the garden being as good as shut up at others. I think the whole force of a garden should be concentrated on that season, when it is enjoyed by the proprietor and his family and visitors. It is in this respect that the list of plants supplied by your able correspondents and their flowering time comes in so very usefully. My diamond, circular, oval, and other shaped plots do not meet with a kindly reception. I would ask my critics how long would any one of these figures preserve its exact shape after being planted with plants having foliage the most diverse in shape, size, and mode of growth. Not one year, I think, as about all the outside lines of any figure a graceful irregularity would naturally arise. We must not look to the sky for cloud figures, these are far too irregular for our purpose, and as a garden itself is a work of the imagination as displayed in its arrangement, and should consist of well-balanced and ordered parts as a whole, so should the subordinate forms, such as beds and groups, fit into and contrast with each other in form and colour. A bed, like the example given, if planted as "J." intended it should be planted, ought to have been 10 yards long by 4 yards wide, and not 10 feet by 4 feet; the first containing an area of 390 square feet, a respectable amount of space, as against the given example of 40 square feet, which is far too small for anything but a bed of *Alternanthera*, or the like. A. Y. E.

THE WEATHER OF 1889.—I venture to send you a summary of the weather during the past year, taken in a very matter of fact, and not at all in a scientific way, which shows forcibly the peculiarly mixed condition of the weather assumed during the year. Very marked indeed is the fact that no continuity of character is shown for any considerable period; the alternations being many and rapid, whilst there seems to be fairly general satisfaction with the weather. There can be no doubt but that the dull cold, which with intervals of rain or sunshine prevailed so considerably during the later part of the spring, and the cold fierce rainstorms of the end of August were serious drawbacks, and materially affected crops injuriously, both early and late. It is curious to find that of their seasons Good Friday and Christmas Day were of the finest and warmest, whilst neither of the Bank Holidays were half so pleasant, indeed the two summer Bank Holidays were wet and ungenial. The year was born in a cloudy white frost, which endured several days, and as if with true phantasmagorical effects, expired in a cloudy dense mist, fading away like a ghost in a melodrama, because enshrouded in vapour. January opened with hoar frost and fog which held till the 8th, when thaw set in, and on the 11th there was rain. The next day snow fell, then rain, and it became milder. The next day was dull, so was the 16th, the air getting softer, and then came a nice spring-like day. On the 20th, considerable rain fell, after a white frost, dull cold weather following. The weather alternated, fog, white frost, then after occasional showers up to the end of the month. February, open weather prevailed from the 1st, colder on the 4th with some snow, but milder next and following days with occasional cold changes and some rain. A sharp frost on the 9th and 10th, with snow on the latter 6 inches deep. Wind northerly and cold, very sharp frost on the mornings of the 12th and 13th, but thaw set in, and all snow had disappeared next day, weather becoming pleasant and mild. On the 16th was heavy rainfall, the ground now literally saturated with water. Then came a mild summer-like day, a wonderful contrast to what had just previously prevailed. Open fairly mild weather continued up to the 24th, when more snow fell, as also next day. Dull weather, with slight frost and falls of snow marked the days up to the 28th, when there was a sharp frost, as also on March 1, continuing up to the 6th, with slight snowfalls. On the 7th heavy rain fell, the soil being once more in a very cold wet state, and unfit for seed sowing. On the 9th we had quite a lovely spring day, then the wind became colder, and some fog prevailed, with cold wind from the north-east up to the 11th, which proved to be a bright and pleasant day. This weather continued up to the 16th, when rain again fell heavily. Then

followed a fine day, then a wild, cold, wet one. Next, a fine bright day, the weather keeping dry and moderately cool up to the 28th, when we had a sharp white frost; the weather kept open till the 31st. April, as becomes its traditional reputation, opened showery, but mild, then dryer up to the 4th, when it became wild and stormy. The 5th was a fine open day, but the 6th was one of rain storms. Then followed dry east wind and pleasanter weather up to and on the 8th, when followed next day a wretchedly wet morning, the rest of the day being dull. Rain and cloudy dullness prevailed also the next day, the soil being in a deplorably sodden state. The 11th was cold and gloomy, remaining dull and dripping up to the 13th, when it became much colder, wind veering to N.E. This continued up to the 18th, next day (Good Friday), was a delightful one, the temperature being almost hot; then it remained open and fairly pleasant with some small showers up to the 24th, colder winds and heavy rains to the 26th, which opened fine, but showers fell towards night. This kind of weather continued up to the 30th, when a very heavy thunderstorm broke in the afternoon, with drenching rain; warmer but wet the following day, and on the 4th of May the weather was fine and warm; this pleasing change continued up to the 11th with slight showers, but on that day it became dull and cloudy, and cooler for a day or two, then became fine, warm, and summer-like up to the 19th, when the temperature fell and rain followed. Then came some charming weather up to the 26th, when the sky became clouded, wind easterly, and heavy rain fell at night, continued till midway the next day, so that the soil was once more in a saturated state. Rain with alternating sunshine marked the rest of the month. June opened warm and sunny, a hot parching wind from the south-west on the 3rd, warm and pleasant next day; then another turn of parching wind, on the 7th, but from the east, raising dense clouds of dust. Hot again next day, followed at night by a tremendous thunderstorm, also more thunder and rain on the next day. Then the wind veered east, and the sky became dull, cloudy and the air cooler. Whit Sunday followed, a truly cold wet day, wind north-east, everybody holiday keeping quite miserable! It became warmer, but still dull and damp; but the 13th was fine and pleasant, also next day. Heavy rain fell on the 15th and night, but was fine next day. On the 17th and on to the 26th wind and dust prevailed, then it became much warmer, and grew hot up to July 2, when clouds intervened, becoming cooler. Up to the 5th the weather became quite summerish, and on the last date was once more hot and dusty, but grew cooler, with cloud and some gentle rain up to the 9th. On the next day it rained heavily the greater part of the day, but was fine in the evening. The 11th was a pleasant day, but on the 12th we had a tremendous downpour of rain; also a heavy rainfall on the 14th, with some intervening sunshine. The next day we had delightful weather, which continued up to the 21st, when it became showery, and next day it rained nearly all the day. It kept colder and rainy up to the 27th, when it took a dry turn, and warm pleasant weather followed up to August 5, Bank Holiday, which, again, was very wet at times, and sadly interfered with outdoor pleasures; the 6th also was showery, but nice weather prevailed up to the 11th, when heavy rain again fell at intervals, as also on the next day; then came some fine weather up to the 14th, when rain again fell heavily in the afternoon; then it took a warm and pleasant turn up to the 20th, when it became mild and windy, literally blowing great gusts, whilst the next day it rained heavily, with strong wind nearly all day—terrible flower-show weather, as also for the harvest. On the 22nd, the weather was cold and unsettled, then followed better weather, cool for the season, but fine up to the end of the month. September opened rather cooler and unsettled, rain and wind alternating with sunshine till the 4th, when the weather again became pleasant. With slight alternations it kept fine and warm up to the 17th, when there was an unusually early sharp frost, doing exceeding harm to tender plants. A lesser frost followed next morning, then it became duller and cloudy, cold at night, also, till the 24th, when we had a thoroughly wet day. Dryer weather succeeded up to October 3, when heavy rain again fell; colder weather and heavy rains followed up to the 10th, when it was fairly fine, but next day heavy rain fell again; yet on the 12th the weather was delightful, and so it continued up to the 16th, when it was a thoroughly wet afternoon; then we had two fine days, followed by heavy rain and wind on the 19th and following day. Dull and

cold on the 22nd, very wet on the 23rd, and gloomy on the 24th. Then came a warm, sunny day, and was followed by one miserably wet on the 27th. Dull weather with some showers filled up the rest of the month. November started wet but became dryer, then rain fell heavily again on the 3rd, was dull on the 4th, and next morning there was a sharp white frost and then a fairly dry day. The 6th was a remarkably fine warm day, then a colder, duller day followed, and on the 10th came a delightful day. The weather kept mild and open up to the 13th, when it became foggy for two days, and on the 15th the weather was again very pleasant; it was dull and cooler up to the 24th, when rain fell in the morning. Milder weather followed, but on the 25th it was wild and wet. Light frosts followed, increasing in intensity on December 1, and continuing up to the 5th, when it became gradually softer, and on the 7th there was snow, which laid until the 9th, when rain fell and the snow soon disappeared; we had then two open days, but white frost came on the 12th and following day, with fogs at night. Then the weather became open on the 14th, and kept so up to the 22nd, when rain fell, and it was a wretched day; a fine day followed. Then came a wet morning, but fine later. Next was Christmas Day, when we had a remarkably dry, bright, soft day, extremely pleasant for the time of year. Dull, somewhat misty weather prevailed on the following day; but on the 29th there was a sharp white hoar frost with some fog, continued in a softer aspect up to the 31st, which was a densely foggy day, till about four o'clock, when the mist lifted, and a very bright, beautiful, but frosty night followed, leading to the new year, 1890. *A. D., Bedford.*

CATS IN THE GARDEN—I felt interested to read in your paper of December 21 the plan of employing a captive cat to scare birds in a garden. I tried the plan some three or four years ago in the garden of my cottage at Sidmouth, and I wish to point out to your readers that if tried with a full-grown cat, it is nearly sure to prove a failure. A strong cat took up its quarters in my garden just before Strawberries ripened, and made itself a "nest" in a corner under a thick bush. She was content to stay there, but I thought a clever scheme would be to chain her up to a dog-kennel in a more open part of the garden. She became furious, however, at the restraint, and seemed likely to go mad. It was a very dangerous process to take the collar off. She then went right away, but after three or four days came back, and occupied her old nest through the summer. Of course we fed her at the nest. It is probable that the plan might succeed if a young kitten were trained up to wear a collar and chain, but my trial showed me that no full-grown puss will stand it. *F. S.*

HEAVY CLAY LANDS—In reply to the query respecting my remark, "It would not be discreet to use anything of a woody nature over drains in gardens" (p. 23), My thoughts were directed to fruit trees, which, I believe, are liable to have their roots attacked by fungi if they come in contact with material of this description. It is not an uncommon occurrence to find lines of pyramids and espaliers planted in gardens for the twofold purpose of utility and appearance, and in such cases some of the trees are almost of necessity in near proximity to drains. It may be argued—it is conceded that the trees are subject to injury from the above cause—that the roots of trees of this character should be kept near to the surface of the soil, and consequently out of the reach of harm in this way. This, in many instances, would be the correct thing to do; there are soils, however, although capable of improvement by the process of draining, in which trees may be allowed to root deeply, and yet grow well and produce good crops of fruit. In such cases it is advisable to let well alone, and I think discreet to guard against introducing any substance into the soil which would be in any way likely to engender fungi, or be in other respects obnoxious to roots. *Thos. Coombes.*

I do not quite agree with "T. Coombes's" remarks on p. 23, as regards the treatment of heavy clay land. The land here is very heavy, and my experience of trenching is to get it done as early as possible in the autumn, and I find that this soil, by giving it a good stir up, say about the middle of the month of February, is put into good working order by the March winds, and numbers of woodlice, slugs, &c., and weed seeds are destroyed. If I left my trenched ground as "T. C." says, it would bake on the surface. I maintain that clay soils should be kept stirred on the surface on every

available opportunity to ensure good crops. With regard to Onions following Celery, my Onions came as the next crop to Celery, and I must say that I never had an even lot of bulbs than those of last season. The sorts grown were Reading Improved and James' Long Keeping. *W. L.*

A GOOD AUTUMNAL ROSE—If I mistake not, my old friend Margottin, of Bourg La Reine, has given us in the new Rose (1888), Gloire de Margottin, one of the best autumnal blooms that we possess. Some years ago he told me that he should endeavour in hybridising to go back beyond General Jacqueminot, which has justly or unjustly been the parent of all our modern red Roses of the hybrid perpetual class, and that he should take that brilliant old semi-double Rose, Gloire de Rosamon, as the mother parent. We had a very brilliant but very thin Rose in Gloire de Bourg La Reine, and now in this we have an equally brilliant and rather fuller Rose, although not, I think, full enough ever to make it an exhibition Rose; but I have found no Rose equal to it in any small collection for autumn. For winter blooming I have but two plants of it, and yet I have been enabled to get really good blooms from it several times during the late autumn months, and have this day, January 2, cut a really good flower, excellent in shape and bright in colour. The habit of the plant is straggling, so much so, that I think it not unlikely that it will make a good pillar Rose, if so, its value would be still further increased. *Will Rose.*

THE HABITATS OF PLANTS AND ARTIFICIAL CULTIVATION—The interesting note, p. 16, reminds me of my old friend Dr. de Vry, well known as a chemist, botanist, and in connection with quinine and the Cinchona plant, in answer to a remark that it was always well to give a plant as nearly as possible the conditions under which it grew in its own country, he said not always; he had to cultivate the Cinchona in Java, and having studied the plant in India or Ceylon, I forget which, he found he could give all the conditions but one, this one being impossible. He found that an entirely different treatment was that which gave the most success. This gave me a good lesson, which I have acted on. There are now in different parts of the country scientific amateurs who by experience and careful observation find out for themselves how to make plants, new or little known to them, thrive best—surely they are not empirics? I have just had to do a little "empiricism" with half-a-dozen plants of *Shortia galacifolia*, to find where they will grow strongest; they have been put in six different situations; I hope that they will grow in all, but do not know where they will thrive best. The *Pyrola*, *Epigaea repens* and *Galax aphylla* give a guide as to their probable requirements. Japanese travellers have told me that *Lilium auratum* is much finer in this country than they have ever seen it at home; and at the time of the Colonial Exhibition a gentleman connected with the Canadian Commission, having on a visit to our Wisley garden, passed a clump of *Sanguinaria canadensis* in full flower. I said, do you not notice your fellow countryman? he answered, the flowers are so much larger than ours, that I did not recognise it. *George F. Wilson.*

ROBERT FENN POTATO—My good friend, Mr. Robert Fenn, formerly of Woodstock, and now of Milhamstead, has informed me that a very fine looking seedling Potato, shown at the Crystal Palace Chrysanthemum Exhibition by Mr. Howard, of Canterbury, received a certificate of merit, and was named as above, and yet no mention of it was made in the papers. I sympathise a good deal in my old friend's complaint, that if it be some hairy or other rebel Chrysanthemum, there is no end to the noise made about it; and yet a hairy Chrysanthemum, let enthusiasts say what they may about it, is but a useful flower sport. On the other hand, a really good Potato comes as a valuable addition to our food supply. Without doubt, there is not much money in Potatoes, whilst there is a little in Chrysanthemums; this is due chiefly to the burst of eloquent description which comes from the pens of press critics. Many of our press men have become Chrysanthemum "connoisseurs"—and have few eyes for anything else, especially such inferior stuff as Potatoes. Why don't gardening press men give a fair and full notice of all the subjects that are presented to them, and not make so much profession of knowledge of specialties? However, to return to Robert Fenn Potato, I hope Mr. Howard will send some of it to Chiswick for trial next summer.

Whatever may be the upshot of Potato trials, there, at least, it is certain that everything is done to give all the same chance, and the quality of any variety is fully tested. *A. D.* [Reporters cannot possibly notice all the subjects presented to them, and they may be excused at a so-called Chrysanthemum Show for confining their attention to Chrysanthemums. *Ed.*]

CAMELLIA-BUDS DROPPING—I should not have ventured to add anything to the above subject, it having been discussed by far abler men than myself (with apparently no nearer approach to the solution of the difficulty). But with the remarks of Mr. Saunders (p. 732, vol. vi.) "that Camellias dropping their buds must necessarily be unhealthy," I must certainly disagree, as I herewith forward you ocular demonstration to the contrary, if the dark green and glossy foliage of the enclosed shoots of Camellias are criterions of health. That marked A is planted out, and drops its buds when they have attained the size of the one enclosed; side by side of these are *fimbriata alba*, *alba plena*, *imbricata*. Countess of Orkney, healthy, flowering freely, and dropping no bud. The others, marked B and C are from plants in pots, which were stood out-of-doors during the summer, and removed into Peach-house in September, and have dropped their buds. Others in pots, not so healthy in appearance, have retained theirs, and are expanding, and all of these had clusters of buds which were thinned so as to leave the terminal one. With Mr. Saunders' concluding remarks, so far as soil and treatment, I agree. But what does he deem is a proper situation? Would the back wall of an earlyinery, started in February, be suitable? For here we have the walls about 14 feet high, clothed with Camellias, healthy, and full of buds, which have been especially useful since October. Temperate, even conditions of climate are most suitable for the Camellia, but these mentioned above have experienced the two extremes, the house being now thrown wide open during the day, and the only heat at night is that derived from the house next to it, by leaving the middle door open. As far as my experience goes, I believe that if once a Camellia is allowed to get dry after the buds are fully developed, dropping will surely follow, though it does not necessarily make the plant unhealthy. I believe the dense shade of the Vines overhead counteracts the effect of the high temperature. *W. H. Stephens.* [Shade is beneficial, Camellias in their native country being found as underwood in forests. *Ed.*]

WINTER MOTH AND LAMPS—I should be glad to know how Mr. Beach (see p. 755, December 28) proposes to catch the female winter moth on the shades he advocates I would rather catch one female than twenty males. *W. Horner.*

DOUBLE-FLOWERED LILACS—Double-flowered Lilacs are not generally valued at their proper worth, or they would be more commonly planted. Double-flowered Syringas are not novelties, *Syringa vulgaris*, *alba plena*, and *S. v. rubra plena*, being long known in gardens, but they do not seem to have prospered. Recently, however, deserving new forms of *Syringa* have originated on the Continent, and have from time to time been introduced into this country. Probably few spring flowering shrubs give more gorgeous displays than the single varieties, and have such delightful fragrance, but it is urged that their bloom is too transitory, but in double-flowered varieties this objection does not hold good, the blooms being more lasting. The double flowers are larger than the single ones, and give even greater profusion. Furthermore, the single-flowered varieties produce masses of seed, vessels, which impoverish the plant when its energies should be employed in perfecting shoots with strong flower buds. New varieties of double-flowered Lilac already introduced number about a dozen, and the following are offered by the trade at the price of from 1s. 6d. to 2s. 6d. each: *Syringa vulgaris* f. p. *hyacinthiflora*; *S. v. l. p.* *Lemoinei*, pure white; *S. v. f. p.* *Mathieu de Dombasle* reddish mauve; *S. v. f. p.* *renoncule*, azure mauve; *S. v. f. p.* *rubella plena*; *S. v. f. p.* *Michel Buchner*, pale lilac, with rose margins. The following being of more recent introduction, are higher priced: *S. v. f. p.* *Madame Jules Finget*, satiny rose; *S. v. f. p.* *pyramidal*, cerulean rose; *S. v. f. p.* *Le Gaultois*, dark peach; *S. v. f. p.* *President Grévy*, violet crimson, grand variety; *S. v. f. p.* *M. Maxime Cronin*, rosy lilac, hose-in-hose; and *S. v. f. p.* *Senateur Volland*, rosy pink, buds, Fuchsia red. *William Earley.*

SOCIETIES.

NATIONAL CHRYSANTHEMUM.

JAN. 8 AND 9.—The mid-winter exhibition of this Society was held on Wednesday and Thursday last in the Royal Aquarium, Westminster. The general character of the exhibits was an advance on the quality of last year's mid-winter show, but in some few instances the blooms left much to be desired.

For the prizes offered for a collection of cut Chrysanthemums (any varieties) in bunches, there were several lots shown. The 1st place being won by Mr. R. Owen, Floral Nurseries, Maidenhead, with brightly coloured flowers, of which the best were Sunbeam, Mrs. F. Thompson, Beauty of Castlewood, L. Canning, Golden Gem, Mrs. H. J. Jones, and Cythere.

In the 2nd prize collection, which came from Mr. J. Kipling, gr. to Lord Lytton, Knebworth, there was a very pretty blending of the colours of the flowers of Kempter, Etoile du Nord, Duchesse of Edinburgh, M. Freeman, Ralph Brocklebank, Mrs. H. J. Jones, and Comte de Beauregard. Mr. G. Bolas, Hopton Hall Gardens, Wirksworth, was a good 3rd, with smaller flowers, having A. Chamrier, Souvenir de Haarlem, Ed. Audigier, Peter the Great, and Princess Beatrice.

The finest stand of twenty-four blooms, any varieties, was that of Mr. Brown, gr. to Mrs. Waterlow, Great Dooris, Biggate, who had some really very pretty blooms, clear and fresh; Mrs. J. H. Jones, C. Sharran, Cythere, Mont Blanc, Septre, Toulouse, Boule d'Or, and Sarnia. Mr. W. Gilbert, gr. to B. Le Neve Foster, Esq., Sennow Hall, Guist, Norfolk, was 2nd, showing Gloriosum and W. G. Drover in fine form. Mr. Kipling was 3rd with Princess of Teck, Progne, and Golden Gem as his best.

The same exhibitor was leading in the class for twenty-four Japanese blooms, having in this stand what were, perhaps, the best lot of blooms in the show. They were of large size and fresh. Mr. H. Cannell, Gloriosum, Mr. Freeman, striatum, Carew Underwood, and Val d'Andorre being conspicuous. A close 2nd was seen in Mr. Sullivan, gr. to D. B. Chapman, Esq., Downshire House, Roehampton—a neat-looking, fresh lot. D. B. Chapman, gloriosum, Mrs. H. Cannell, Lor de Japon, and Stanstead White being among those shown.

Mr. Brown had the best twelve varieties Japanese, in which Hamlet, C. Sharran, Sunflower, Belle Faule, and Meg Mer-ries were the best. Mr. Gilbert, who was awarded the second place, also had fair quality blooms in La Boule d'Or, gloriosum, Madame Audigier, &c.

There was a considerable quantity of other plants and flowers shown. Cyclamen were very well shown by all exhibitors. Mr. Clarke, of Hounslow, receiving 1st, being followed by Mr. J. May, Twickenham; and M. D. Phillips, Slough, all running closely. In the class from which nurserymen were excluded, the last-named exhibitor was placed 1st.

Primulas were another feature, and Messrs. H. Cannell & Sons, Swanley, Kent, made a capital display of well-grown and flowered plants. One named Progress, rich carmine, large single flower, is worthy of note; White Perfection and Improved Emperor were also good.

Messrs. Cannell offered prizes for twelve plants of Primulas of their own raising; Mr. T. Mursell, gr. to Mrs. Burton, Streatham, being 1st, with rather overgrown plants. Mr. Carter, gr. to Alderman Evans, Ewell Grove, Ewell, Surrey, had a nice lot of twelve plants, and took 1st in another class.

Groups of miscellaneous plants were of no special merit, and in the competition a 2nd prize, only was awarded.

Collections, not for competition, were sent by Mr. W. Holmes, Frampton Park Nurseries, Hackney; Messrs. J. Laing & Sons, Forest Hill, S.E.; and Mr. J. G. Drain, Southgate, N.

A meeting of the committee was held on Wednesday, with Mr. R. Ballantine in the chair. There were but few subjects submitted, as was to be expected at this season of the year. Of new Chrysanthemums, the following varieties were shown:—Mrs. Waterer, a Japanese variety from America, ivory-white, with green centre—somewhat dull looking, rough, and late blooming; the committee desired to see this again earlier next season. This came from Mr. E. Becket, Aldenham House Gardens, Elstree. And Kioto, a bright golden incurved Japanese variety, much in the way of Mr. H. Cannell; a late variety was shown, and which the committee also wished to see again. This is another American variety, and was shown by Mr. R. Owen.

THE SCOTTISH HORTICULTURAL ASSOCIATION.

The ordinary monthly meeting of this Society was held on the 7th inst., in 5, St. Andrew Square, Edinburgh, Professor Bayley Balfour, President, in the chair. A paper, by Mr. F. W. Moore, Curator of the Royal Botanic Gardens, Dublin, on "Experiments with Manure in Orchid Culture," was read by Mr. D. P. Laird. In opening his paper, the writer alluded to the difficulties experienced in the cultivation of individual species in various families of plants. The great family of Orchids had its share of intractable species. In regard to Pleione, with the culture of which the writer had formerly had some difficulty when using the generally prescribed compost for these Orchids, to which he added experimentally, dried cow-manure. The success was only partial, owing to the quickly decomposing nature of the material. Liquid manure was tried, and was found to be more effectual in improving the condition of his plants. A layer of 1-inch bones placed over the drainage gave good results, but did not realise the grower's ideal of perfection. In succeeding experiments with Pleione, the bones were intermixed with the compost and along with them a "pinch" of fish potash guano, which worked a great improvement on the plants, enlarging the leaves and the pseudobulbs greatly. A 12-inch pan of *P. maculata* so treated last year gave as many as 137 blooms. *Calanthe masuca*, *Cydogyne faccida*, *Cyripedium barbatum*, *C. insigne*, *Dendrobium nobile*, *Dendrobium filiforme* were all experimented upon with the fish phosphate guano with excellent results in every case. The effect of the manure was most marked on the last-named plant, with which till using it the writer had but indifferent success. Specimens of the inflorescence of *Dendrobium Coddianum*, taken from two separate plants, one of which was treated with the fish potash and the other not so treated, were exhibited, that of the former measured nearly 12 inches in length, while the latter was barely 6 inches long. Other species experimented on with this manure were *Luddemannia Pescatorei*, *Angulosa Ruckeri sanguinea*, and others; *Cymbidium elegans*; *Masdevallias*, several species; *Restrepia elegans*, *Houlletia Brocklehurstiana*, *Pleurothallis velaticaulis*, *Dendrobium*, several species, and species of many other genera, selected with the view of testing the result of its application on many diverse forms.

The conclusions arrived at by the writer were, that the manure was uniformly beneficial. The proportions used were not stated, but the quantity was always small. It was given in spring while potting or top-dressing the plants, and only once a year, and it had never been supplied in a liquid state.

Exhibited on the table were some very superior specimens of Blenheim Pippin Apple, sent from Mr. Barron, Old Midlam, Aberdeenshire. The fruits were the produce of a tree fifty years old, and were characterised by Mr. M. Dunn as the finest sample of the kind he had seen of Scotch growth for many years. They were awarded a Cultural Certificate. Flowers of *Rhododendron precox* were exhibited by Mr. Foote, Parson's Green. Mr. Rushton, gardener, Clerwood, Corstorphine, exhibited a very fine stand of Chrysanthemums of exhibition proportions and quality, which were awarded a Cultural Certificate. Messrs. R. B. Laird & Sons exhibited a very superior bloom of Chrysanthemum Lady Lawrence, which was much admired.

VARIORUM.

ENTELEA ARBORESCENS. R. BROWN.—This handsome plant forms a much-branched shrub or small tree, sometimes 25 feet high, with a trunk from 4 inches to 9 inches in diameter. The foliage and flowers are striking and attractive, presenting an appearance widely different from that of any other native plant. The young shoots and leaves beneath are covered with a fine white down, the leaves being of a soft deep green above, and in outline bearing some resemblance to those of the black Mulberry; they are sometimes 9 inches in length, including the petiole, which varies from 1 inch to 2 inches, and are furnished at the base with a pair of narrow stipules. The blade is drooping, produced into a rounded lobe on each side of the base, and is narrowed into a long point at the apex. It varies from 2 inches to 6 inches in

breadth, and the margin is cut into a vast number of small irregular blunt teeth, or crenatures. The flowers are developed in panicles or cymes, on the long stalks, springing from the axils of the uppermost leaves; the branches of the inflorescence, the pedicels, and the narrow bracteoles are white with fine down. The large flowers are snowy-white; the petals present a wrinkled appearance, and the stamens are very numerous. The fruit is very singular, about three-quarters of an inch in diameter, and clothed with hard brittle spines, sometimes an inch long, so that it bears some resemblance to a small Spanish Chestnut. It is from five to seven-celled, each cell containing numerous seeds. T. Kirk, in "Forest Flora of New Zealand."

ROSE STATISTICS.

[In connection with the recent Rose Conference at Chiswick, a series of questions was put to Rose growers in different parts of the kingdom. The replies to these questions have, with great labour and zeal, been summarised by the energetic Secretary of the Royal Horticultural Society, and are published in the last number of the Journal. From that periodical we extract the following summary. E.]

BEST TWELVE H.P.'S 10N SHOW.—Although thorough-going rosarians will, as I remarked in a previous note, revel in the returns, to a great many humbler Rose-lovers and Rose-growers they will prove somewhat hard reading, and for such as are content to extract the honey at second-hand, I have drawn up the following lists, resulting generally from the statistical returns:—

LIST I.

The Best Twelve H.P.'s for Show Blooms. (79 Voters.)

	Votes.		Votes.
1. A. K. Williams	71	33. Abel Carrière	...
2. Le France	69	34. Dr. Andry	...
3. Marie Bannana	65	35. Countess of Rosebery	...
4. Alfred Colomb	61	36. General Jacquemont	4
5. Charles Ledoyere	60	37. Mons. Noum	...
6. Ulrich Brunner	60	38. Mme. Victor Verdier	...
7. Gabriel Luyet	55	39. Semateur Vaisse	...
8. Morelle de Lyon	48	40. Duchesse de Moray	...
9. Baroness Rothschild	29	41. Marguerite de St.	...
10. Etienne Levet	27	Amund	...
11. Louis van Houtte	26	42. Prince of Waltham	3
12. Duke of Edinburgh	27	43. Prince Arthur	...
13. Marguerite de Castellane	26	44. Victor Hugo	...
14. Captain Christy	21	45. Victor Verrier	...
15. Lady Mary Fitzwilliam	20	46. Annie Wood	...
16. ...	20	47. Clara Cochet	...
17. ...	20	48. Countess of Richmond	...
18. Horace Vernot	19	49. Duchesse de Valom	...
19. François Machelon	18	brost	...
20. Dupuy Janain	15	48. John Hopper	2
21. Eugenie Verrier	14	49. Magna Charta	...
22. Her Majesty	12	46. Reynolds Hole	...
23. Marie Eady	11	46. Viollette Boyer	...
24. Heinrich Schulters	10	46. Xavier Olibo	...
25. Countess of Oxford	9	50. Euse Borel	...
26. Duchess of Bedford	8	50. Mme. Hippolyte Ja	...
26. Prince Camille de Ro	7	50.
27. Beauty of Waltham	6	55. Eugenie Furst	...
27. Le Havre	4	55. Mme. Eugenie Ver	...
29. Camille Bernardin	5	55. Edouard Morren	...
29. Earl of Dufferin	5	55. Mons. Bonevine	...
29. F. T. Peas	5	55. Glory of Chestnut	1
29. Maurice Bernardin	5	55. Duke of Teck	...
		55. Dr. Sewall	...
		55. Star of Waltham	...
		55. Countess Camoulo	...
		55. Princess Mary of Cam	...
		bridge	...
		55. Baroness Maynard	...
		55. John Stuart Mill	...

From this list it will at once be noticed that in selecting the best twelve Roses, seventy-nine growers have named no fewer than sixty-eight varieties; whilst at the same time the eleven best are very clearly notified, and Duke of Edinburgh makes a very fair fight for the remaining place in the best dozen. Newer sorts are manifestly at a disadvantage in such statistics as these, some growers possibly not having yet made trial of them; and from this point of view it is probable that, if the selection were repeated in a year or two's time, Mrs. J. Laing, Earl of Dufferin, and perhaps Victor Hugo and Clara Cochet, would stand relatively higher than they do at present.

THE NEXT BEST TWELVE H.P.'S.

Of these I have only given the names of those obtaining four or more votes, there being no less

than sixty-seven other varieties mentioned. Here it is obvious that the higher ones in List I. will figure amongst the lower in List II., as they have already received almost as many votes as possible.

LIST II.

The Next Best Twelve H.P.'s for Show. (78 Voters.)

Table with 3 columns: Rank, Name, Votes. Lists 12 H.P. varieties and their respective vote counts.

LIST III.

H.P.'s spring Twenty or more Votes when Lists I. and II. are combined.

This list practically gives the opinion of the voters as to the best twenty-four H.P.'s for show purposes.

Table with 3 columns: Rank, Name, Votes. Lists 24 H.P. varieties and their respective vote counts.

TWELVE MOST USEFUL H.P.'S AS CUT FLOWERS FOR DECORATION.

In this list I have omitted all receiving less than six votes, as their name was verily legion.

LIST IV.

Twelve Most Useful H.P.'s (64 Voters.)

Table with 3 columns: Rank, Name, Votes. Lists 12 H.P. varieties and their respective vote counts.

Here it will be noticed how facile princeps among useful Roses stands La France, the only wonder being that it did not receive the full number of sixty-four possible votes. In my own opinion, for cut Roses for house decoration La France is a perfect Saul, not only amongst H.P.'s, but amongst all Roses—a head and shoulders above all its brethren—and only approached by such as the Common Pink China Monthly Rose, Mrs. Bosanquet, Gloire de Dijon, and if it had but a little scent, Souvenir de la Malmaison. And I cannot but think, if a little more stress had been put upon the word "useful," that Captain Christy, Charles Lefebvre, Marie Baumann, Marquise de Castellane, Alfred Colomb, Duke

of Wellington, and certainly Earl of Pembroke, would have taken higher place than they do.

I have made no list of "Next Best H.P.'s for Cut Blooms," as there are comparatively few votes, and it would have had but slight influence (and that, perhaps, not quite a fair influence) in determining the position of the leading flowers, when combined with List IV.

With the "Garden Roses" I have not dealt at all, as the ideas of the voters as to what is meant by a "Garden Rose" seems to have been so very various that hardly any individual varieties have received any great preponderance of votes. I fancy Mr. Girdlestone's paper, on p. 194, will be of more use to the general reader than any list I could have compiled from the statistics. W. Wilks, Sec. R.H.S.

(To be continued.)

FOREIGN CORRESPONDENCE.

SAMBUCUS RACEMOSA.

This plant is indigenous in the higher parts of Belgium, about Spa and Stavelot, where it flourishes and fruits abundantly, much better than when cultivated in the low parts of the country. The best specimens are found on sunny slopes of schistaceous shingles. It is naturally perfectly hardy in such a very cold climate. In the lowlands we find it very useful for filling the not too dense first nine woods, where no other shrub would grow readily. There is a very similar species found in Yezo, North Japan, if not the same. J. v. Polak.

THE WEATHER.

By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named, and this combined result is explained in Day-degrees—i.e. "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns: DISTRICTS, TEMPERATURE, RAINFALL, BRIGHT SUN. Rows include districts like La France, General Jacquemont, Duke of Edinburgh, etc., with weather data.

The districts indicated by number in the first column are the following:—

- 1, Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S. Principal Graying Area, Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending January 4, is furnished from the Meteorological Office:—

"The weather has been cloudy or dull generally in

all parts of the kingdom. Over the greater part of England much fog or mist has prevailed. In Ireland and Scotland rain has fallen at rather frequent intervals, but the amounts were in most cases slight.

The temperature has again been above the mean over Ireland and Scotland, but over England it has continued below; in 'England, N.E., and 'England, S., a deficit of 5° is shown, while in the 'Midland Counties' and 'England, E.' there has been a deficit of 7°.

The highest of the maxima, which were recorded on the 4th, varied from 46° in 'England, E., to 52° or 53° in most other districts. During the greater part of the period the daily maxima at many of the English stations were very little above the freezing point. At Bawtry, on the 3rd, the thermometer did not rise above 25°. The lowest of the minima were registered during the earlier days of the week, and ranged from 18° in the 'Midland Counties,' and 19° in 'England, E., and to between 20° and 21° in the other English districts; in Scotland, they varied from 22° to 25°, and over Ireland, from 27° to 29°.

The rainfall has been rather more than the mean in 'Ireland, S., and about equal to it in 'Ireland, N., but in all parts of Great Britain it has been less than the normal.

Bright sunshine has again been very little prevalent, the percentage of the possible amount of duration having ranged from 6 in 'Scotland, N., 7 in 'Scotland, E., and 8 in the 'Midland Counties,' to 23 in 'England, S., and 'Ireland, N.'

MARKETS.

COVENT GARDEN, January 9.

BUSINESS very dull, and prices of imported goods much lower. Grapes realising better values. James Webber, Wholesale Apple Market.

SEEDS.

LONDON: Jan. 8.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, report to-day's market ill attended, with almost a complete absence of business. Cloverseed of all kinds is still neglected, the great majority of the home-grown samples showing area of poor quality. In Ryegrasses there are but few transactions passing. Blue Peas keep steady. Rape seed is scarce, and still trends upwards. For Mustard values are firm. Bird seeds continue remarkably cheap.

CORN.

Averages.—Official statement of the prices of British corn, imperial measure (quarter) for the week ending January 4.—Wheat, 30s.; Barley, 30s. 5½d.; Oats, 18s. 3d. For the corresponding period last year:—Wheat, 30s. 4½d.; Barley, 28s. 9d.; Oats, 16s. 6d.

FRUITS AND VEGETABLES.

SPITALFIELDS: Jan. 8.—Quotations: Savoys, 1s. 6d. to 3s. per do.; Cabbages, 1s. to 2s. do.; Cauliflowers, 7s. to 12s. do.; Sprouts, 9d. to 1s. 3d. per half-sieve; Turnip-tops, 1s. to 1s. 3d. per sack; Greens, 1s. 6d. to 2s. per dozen bunches; Turnips, 2s. to 3s. do.; Carrots, 18s. to 28s. per ton; Parsley, 1s. 6d. to 2s. per dozen bunches; Beetroots, 3s. to 1d. per dozen; Parsnips, 4d. to 6d. per score; Sea-kale, 1s. to 1s. 6d. per punnet; Endive, 1s. to 1s. 6d. per dozen; Curley Kale, 1s. per bushel; Cabbage Lettuce, 1s. 6d. to 2s. per dozen; Mustard and Cress, 1s. to 1s. 6d. per dozen baskets; Celery, 4d. to 9d. per bundle; Horseradish, 1s. to 1s. 3d. do.; Spanish Onions, 6s. to 7s. per case; English do., 8s. per case; Bordaux do., 4s. 9d. to 5s. 3d. per bag of 110 lbs.; Dutch do., 4s. 9d. to 5s. 3d. per bag of 110 lbs.; Belgian do., 5s. 9d. to 5s. 3d. do.; English Apples, 3s. 6d. to 6s. per bushel; American do., 13s. to 20s. per barrel.

POTATOS.

BOROUGH AND SPITALFIELDS: Jan. 7.—Quotations:—Regents, 40s. to 85s.; Hebrons, 45s. to 105s.; Magnums, 45s. to 90s.; Imperators, 40s. to 70s. per ton.

STAFFORD: Jan. 8.—Quotations:—Regents, 60s. to 70s.; Hebrons, 60s. to 80s.; Magnums, 55s. to 65s.; Imperators, 55s. to 70s. per ton.

SPITALFIELDS: Jan. 8.—Quotations: Early Rose, 40s. to 50s.; Hebrons, 50s. to 65s.; Imperators, 50s. to 60s.; Regents, 50s. to 65s.; Magnums, 45s. to 60s. per ton.

HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the preceding week:—Prime Clover, 76s. to 98s.; inferior, 46s. to 75s.; Hay, best, 60s. to 92s.; inferior, 26s. to 50s.; and Straw, 28s. to 40s. per load.

NOTICES TO CORRESPONDENTS.

CATTLEYA CITRINA, STANHOPE & Co.; D. C. D. Employ blocks for the first, and baskets for the others; but if you have a great number of Cattleya citrina, these might be put thinly in baskets also. The interstices at the bottom should be numerous, and large enough to afford an easy egress for the longer spikes.

CORRECTION: CATTLEYA GIGAS KANDERIANA.—I find that seven flowers is the most we have had on a spike of Cattleya gigas Kanderiana, and not eight, as stated in my note at p. 716 of the last volume of the *Gardener's Chronicle*, an error I hasten to correct. S. Cooke, Rosefield, Stronachs.

EGCALYPTUS. The first species described was *E. obliqua*. L. Heritier, a French botanist, described the species from a specimen he saw in cultivation at Kew in 1788. It is a native of New South Wales, Victoria, South Australia, and Tasmania, and is useful for its timber, while the bark is suitable for paper-making. See Mueller's *Fucaloptographia*.

FRUIT TREES: *F. Morris*. The foliage has been most probably stripped, and crop destroyed by the grubs of the winter moth in previous years. You must protect the trees by bands of brown paper smeared with cart-grease, the smearing being done several times between October 1 and end of January. Spraying in summer time with some of the arsenical mixtures in vogue will do much good, of course, it being washed off the trees before gathering the fruit. A useful implement for destroying the moths nests, which are fixed in the twigs, is a small torch or lamp to be used at this season.

GIANTIC FLOWER IN THE PHILIPPINES: *H. G.* This time the story is correct. The plant is *Rafflesia Schadenbergiana*, figured in the *Gartenflora* for 1855. The colour is yellow and brown.

INSECTS: *G. J.* Your Daffodil bulbs are attacked by the larvae of a bee-like two-winged fly (*Merodon Narcissi*), described and figured by "Ruricola" in the *Gardener's Chronicle*, 1842, p. 204. L. O. W.

LILAC FOR WINTER: *Hortus*. The Persian Lilac is mostly grown. It is forced in the dark, and is scentless. It is still called French Lilac, although it is not now solely French forced.

LONDON PURPLE AND PARIS GREEN: *R.* We believe both are preparations of arsenite of copper. The term London purple does not appear to be known in this country, but Paris green is known as "emerald green," and is a compound of arsenite and acetate of copper.

PLANTING HOEDGES: *G. H.* Undoubtedly the best time is in August and September, and the next, late in April and beginning of May. Always get as much soil and roots as possible; water the mass when the hole is half-filled, and again finally when the filling in is done—afterwards put on a mulch.

MEALYBUGS ON VINES: *Young Scot*. Many different substances will kill the insect, but the difficulty with all is to get the remedy in contact with it. There are clay and gas-tar, brine, methylated spirits, Gishurst soap, at the rate of 4 oz. to the gallon, as a wash, afterwards coating the stems with an adhesive mixture of clay, cowdung, &c., to smother any insects which remain hidden in the crevices of the bark. This last "remedy" is one of the best; but the insect hides in the woodwork, brickwork, hot-water pipes, joints, and upperpart of the border, and means must be taken to clear it out of these retreats, by painting sashes, shelves, rafters, staging, putting up crevices, or washing woodwork and walls with carbolic soap, afterwards limewashing the latter. The surface soil should be carefully skimmed off and charred, new soil being brought in as a top-dressing. Keep a bottle of methylated spirits handy for summer use; it is sure to be required.

MISTLETOE: *A. J.* There is no certain method of getting this parasitic plant to take to any kind of tree. There is no doubt that seeds which have been eaten by birds, and expelled undigested, do become fixed on the branches of the Apple, Sallow, Aspen, Thorn, Maple, &c., and develop into plants; but artificial attachment is not often successful, however apparently careful it may be performed. The warmth of the bird's body, and perhaps the action of the juices of its stomach may have an effect on the ripe seed of the Mistletoe in aiding germination after it is stuck on a branch. Mistletoe is usually found to spring from the under-side of a branch, a spot where it is shaded from the sun, and kept moist by dew and rain, both of which run round the branch, and maintain it in a wet state longer than is the case with the upper portions. Obtain ripe seeds, clean them in warm water, make a hole or slit in the bark on the under side of a branch, insert the seed, and secure it by a piece of thread. By passing the seeds through the stomachs of fowls in confinement better results might be obtained.

NAMES OF FRUIT: *W. Compton*, Pear Butte Diel.—*E. J. J. & Co.*: Apple Gloria Mundi.

PERIODICALS. *G. M.* No such one exists as *Land and Labour, Forest Flora of New Zealand*, 1 vol.; price not known to us. It is published at the expense of the New Zealand Government.

PLANTING: *G. W.* On the lawn a few well-grown solitary Conifers would be more effective, if the sites for them are well chosen, than fifty spotted over the grass. Groups of two or three closely planted, if of one species, look well. All these "spiky" trees

should have foils from deciduous round-headed trees, and especially weeping trees in their neighbourhood. If many Conifers are planted about the garden, a gloomy effect will be given it in a few years. Plant more flowering trees and shrubs and deciduous trees of varied form, colour, and height and density of habit. Above all, if the soil be suitable, plant American Oaks in variety, Catalpas, Tulip tree, *Sophora japonica* in variety, *Celtis occidentalis*, *Pyrus*, *Sorbus*, *Gleditsias*, *Ailanthus*, *Gymnocladus canadensis*, *Platanus*, *Tilia* in variety, especially *T. americana alba*; *Juglans americana nigra* and *J. a. cinerea*, native trees being used as nurses, and in less dressed parts of the place, and for avenues, park groups. There is nothing to beat our Elms, Chestnuts, Oaks, common Lime, Beech, Maple, Birch, always much of this; a few Willows and Aspens—they make grand trees in a few years; and Alder, the latter being kept to one stem sometimes. You will get the best effects by keeping one genus of trees by itself, or nearly so; and surprises in landscape formed by enclosing certain areas by dense belts, and to be seen only on entering them, are more pleasing than what one sees all over a place, from, say, the platform round the mansion or a spot or two in the grounds.

TERMS OF AGREEMENT: *S. H. G.* You seem to have been cheated, but we do not think you can claim anything, or if you made the attempt to do so, that it would be worth your while.

NAMES OF PLANTS: *O. S. (Holland)*. The envelope was duly received, but it contained no plant.—*T. M.* *Saxifraga sarmentosa*.—*G. R. T.* *Barkeria elegans*, a fine form. The type is given at fig. 11.—*F. Briggs*, 1, *Adiantum hispidulum*; 2, *Peperomia argyrea*; 3, *Marranta bicolor*; 4, *Agapanthus minor variegatus*; 5, *Selaginella Wildenovi*; 6, *Aspi-*

FIG. 11.—BARKERIA ELEGANS.

dium falcatum.—*Wm. T. & S.* The flower sent appears to be almost the same as that illustrated in our issue for Feb. 26, 1887, p. 250, as *Lelia anceps* var. *stella*, but it may be the *L. Schroderi* of Reichenbach.—*R. H.* A good form of *Cypripedium venustum*.—*W. P.* *Eupatorium gracile*.—*Campy*, 1, *Odontoglossum Lindleyanum*; 2, *O. lanceans* (poor form).—*G. A.* *Ventnor*, *Ansellia africana lutea*.—*D. K.* What you send is not a Lemon, but one of the cultivated Oranges, a variety of *Citrus aurantium*.

ANDRE LEROYS' Nurseries at Anglets,

France, the largest and richest in Europe in Collections of FRUIT and ORNAMENTAL TREES, SHRUBS, CAMELLIAS, ROSES, SEEDLINGS, STOCK FRUIT TREES, &c. CATALOGUES sent on application. Freight from Angers to London is very moderate. Medal of Honour at the Universal Exhibition at Paris, 1875.

Orders must be addressed to Messrs. WATSON and SCULL, 60, Lower Thames Street, London, E.C.

LILIES and ORCHIDS.—An immense stock

of recently imported Plants, compels a sale of the Established Plants to make room. They have not yet flowered, but are all flowering plants, and most of them are sold at a low price. Very valuable varieties are certainly to be obtained, and great bargains; see public journals for high prices recently obtained. The special offer affords a paying investment to anyone with glass at command, which should not be overlooked, such plants may never again be offered to the public and trade.

My first consignments of LILIUUM ACUTUM have arrived, prices 4d., 6d., 8d., 1s., and 1s. 6d. each; per 100, 30s., 35s., 45s., 55s., and 70s. Liberal terms to the Trade.

VULCAN IRONWORKS,
WINCHESTER.

THE VULCAN HIGH DUTY HYDRAULIC RAM

Is the most efficient, self-acting Pump. It will force water from streams or springs on low levels to tanks or reservoirs on hills, &c. It saves all water carriage, and is always at work, requiring no attention.

All that is necessary is a small fall from a spring or stream, say 24 inches, when water can be forced to heights varying from 200 to 300 feet, and 2 miles distant.

PORTABLE GARDEN PUMP.

Estimates sent free for Draining and Fitting up Tube Wells and Pumps, Deep well Pumps, Fixed and Portable Garden Pumps, &c., and for Laying Domestic Water Supply to Mansions, Farms, Nurseries, Greenhouses, &c.

HILL & SMITH'S BLACK VARNISH
for Preserving Ironwork, Wood, or Stone.

(Registered Trade Mark.)

An excellent substitute for oil paint, at one-third the cost. Used in all London Parks, at Windsor and Kew Gardens, and on every important estate in the Kingdom. Has stood the test of forty years' trial. Requires no mixing; can be applied cold by any ordinary labourer. Price 1s. 6d. per gallon at the manufactory, or carriage-paid to any railway station, 1s. 6d. per gallon in casks of 30, 20, or 10 gallons.

CAUTION.—Every Cask bears the above Registered Trade Mark. Beware of cheap imitations.

WE HAVE A VACANCY in the Invoice Department for a smart, quick LAD, who writes a good hand in French and English, and who has had some experience at Counter. It is a good opportunity for a Gardener's Son who wishes to improve himself in the Seed and Nursery Trade.—Apply, to own handwriting, giving references and salary required, to JARMAN AND CO., Clarendon, Somersetshire.

WANTED, a young LADY, to Assist in a Florist Shop. Well up in Wreath, Cross, and Bonquet Work.—Queen's Road Nursery, Queen's Road, Peckham.

WANT PLACES.

Letters addressed "Post Restante" to *Intants* or to fictitious names are not forwarded, but are at once returned to the writers.

SCOTCH GARDENERS—I have at present several very superior MEN on my Register, whose character and ability will bear the strictest investigation.—JOHN DOWNE, Seodunam, 144, Princes Street, Edinburgh.

To Noblemen and Gentlemen requiring Land Agents STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 27a and 29a, High Holborn, W.C.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners, Foresters, Land Stewards.

R. B. LAIRD AND SONS can recommend with every confidence Scotchmen thoroughly qualified as GARDENERS, FORESTERS, or LAND STEWARDS, either for large or small estates, and who will be pleased to furnish full particulars on application.—17, Frederick Street, Edinburgh.

Gardeners, Foresters, and Farm Bailiffs.

LITTLE and BALLANTYNE, The Queen's Nurserymen and Seedsmen, Carlisle, invite correspondence with Landed Proprietors, Agents, and others requiring the services of GARDENERS, FORESTERS, and FARM BAILIFFS. Their extensive business relations throughout the Kingdom enable them to distinguish men of good character and ability, such as they would be glad to recommend.

GARDENER (HEAD).—Age 33, married; fifteen years practical experience in all branches. Two and a half years' excellent character.—T. S., 18, Angles Road, Streatham, S.W.

GARDENER (HEAD).—Age 31; sixteen years' experience in Stove, Greenhouse, Vines, and Flower and Kitchen Gardens. Three years' good character.—W. BINGHAM, 25, West Place, Wimbledon, Surrey.

GARDENER (HEAD).—Age 48, married; thoroughly experienced in Stove, Plant, Orchids, and General Routine of Gardening. Seven years' character.—H. W. SHRUBBALL'S Lodge, Park Lane, Croydon.

GARDENER (HEAD), in a good establishment.—Highest references. Thirteen years' experience, five years' last place. Left through duty.—J. WARD, 13, Munsfield Road, Nottingham.

TO FLORISTS.—Situation wanted by a Lady. Experienced.—L. J., Fortune Gate Parade, Harlesden.

HOLLOWAY'S PILLS and OINTMENT.—Colds, Coughs, Shortness of Breath.—These maladies require early and unremitting attention, for if neglected they often end in asthma, bronchitis, or consumption. The Ointment well rubbed upon the chest and back, penetrating the skin, is absorbed and carried directly to the lungs, where it expels all impurities. All the blood in the body is perpetually passing through the lungs, and there all noxious particles tending to disease can be quickly, thoroughly, and permanently neutralised, rendered harmless, or ejected from the system. Holloway's Ointment and Pills perfectly accomplish this purpose; and through the blood thus cleansed, the influence of these wonderful remedies is carried to every part of the human body, and thus cures all diseased action, whether internal or external.

FOSTER AND PEARSON, BEESTON, NOTTS.

THE "CHILWELL NURSERIES" BOILER

(Registered).

EXP. ANATION.

Water passes through the return Pipe into the Box A, thence through Pipes BBBBBBB to Box C, thence through Pipes DD to Box E, thence through Pipes FFFFFFF to Bores HH, thence through Pipes IIII to Bores KK, and thence into Box L.

We can CONFIDENTLY RECOMMEND THIS BOILER for Heating Apparatus of 1500 feet and upwards. We have had a number of these Boilers at work for five years, and THEY HAVE GIVEN GENERAL SATISFACTION. The Boilers are now also made with 2-INCH WROUGHT WELDED STEEL TUBES, which diminish the risk of breakage. THEY HAVE STEEL WATER BARS.

25, Old Jewry, E.C. F. C. GOODCHILD, Secretary.

"Now is the Time to Plant Trees." ROBERT NEAL begs to call the attention of Gentlemen, Local Boards, Builders, and others who intend planting this season, to his large and varied stock of Shrubs, standard, Ornamental, and Fruit Trees, TREES, ROSES, CLIMBING PLANTS, &c., which, being well transplanted, are in fine condition for removal, and having been grown in the vicinity of London, are especially adapted for town and street plantings. Special quotations for large quantities, delivery free within a radius of six miles of the nursery. Inspection of the Stock solicited. CATALOGUES freely on application. Also offer extra fine foreign SEAKALE and RHUBARB. The Nurseries, Trinity Road, Wandsworth Common.

HARTLANDS 5th page "YEAR BOOK" of SEEDS for 1890. Within itself unique and the most complete. His "Book of Diffidils" has no rival in the United Kingdom. His "Book of Diffidils" for 1890 is not like any other publication throughout the British Isles, and there are seeds and plants offered that no other grower has to offer. Send three stamps to the Editor, "The Gardeners' Chronicle," 41, Wellington Street, Strand, W.C., and write for copy.

WM. BAYLOR HARTLAND, Old Established Seed Warehouse, 24, Patrick Street, Cork.

BEGONIAS A SPECIALTY.—Awarded Four Gold Medals. Selected from the Best Plants. In beautifully illustrated Packets, choice mixed, Single or Double varieties, 1s., 2s. 6d., and 5s. per packet. Collections—Single, 12 named varieties, separate, 5s., 6d.; 6 ditto, 3s. Tubers, 12 named varieties, separate, 10s., 12s., 15s., 20s., 25s., 30s., 40s., 50s., 60s., 75s., 100s., 125s., 200s. per doz.; Bedding, choicest, 6s. and 9s. per doz.; choicest Named Doubles from 42s. per doz.; Unnamed, very choice, 24s. and 30s. per doz.; choicest Mixed, 18s. per doz. ROGUES freely on application. To procure our splendid strain, CATALOGUES gratis. JOHN LAING and SONS, Begonia Growers, Forest Hill, S.E.

CARNATION, GLOIRE DE NANCY.—We are sending out our own strain, the grandest white, clove-scented flower in cultivation; flowers from 6 to 8 inches round; for cutting, border, or conservatory decorations, it has no equal; good strong rooted plants, ready to pot up or plant out, 50s. for 100, 15s. for 25, 8s. for 12. We have also a grand lot of the true OLD RED CLOVE layers (we never had better) at 20s. for 100, 10s. for 50, 6s. for 25; also a fine lot of the NEWNESS, light terra-cotta, ROSEY MONN, and fine pink, at 20s. for 100. And a grand lot of double white—COLLINS in 5-inch pots, in flower and bud, at 10s. per doz.—FRILLS and SONS, Cumberland Park Nurseries, Willsden Junction, W.

Brocoli.—Good Sorts not Common in the Trade. HARTLANDS "APRIL QUEEN."—Is a sterling novelty from South of Ireland. Certainly one of the finest in cultivation; ready for use during the months of April and May. The heads are of immense size and the leaves, which are most abundant and peculiar in colour, form such a thorough protection that the outer appearance, before being strip, is that of a "high quality" Cabbage. It has been grown locally to great perfection—some heads weighing over 14 lb., from the very close protection—white as snow. In small packets, 1s. 6d.

WM. BAYLOR HARTLAND, Old Established Seed Warehouse, 24, Patrick Street, Cork. Wholesale, from HURST and SONS, London. Year Book of Seeds for 1890 now ready.

WEBBS' NEW 'SENSATION' TOMATO.

Flatish-round in shape, perfectly smooth, of rich deep red colour, and the most delicious flavour; and, being large and handsome, it is of great value for the exhibition table.

1s. 6d. and 2s. 6d. per Packet, Post Free.

VALUABLE TESTIMONY.

From Mr. GEO. HAWKINS, Gardener to Col. Torberville, Ewenny Priory, Glamorganshire.

"Last year I grew your Tomato—Sensation—in pots, and it gave me such satisfaction that this year I grew it out of doors, in different places and aspects, and to my surprise it has done wonderfully well in every place. I never had a Tomato to put so freely, and such large fruit, without any thinning. I put fifteen plants on the wall outside one of my pots; the wall is 3 feet 6 inches high, and 50 feet long, with a border only 9 inches wide. Mr. J. Blair, of Margam, called on the 6th of this month, and it quite surprised him to see such fruit—he told me to get a photo taken. I had gathered some ripe fruit and I counted the remainder—there were 670 fruit—and twelve of them weighed 8 lb. 10oz."

For particulars of Novelties and Specialties for 1890, see

WEBBS' SPRING CATALOGUE

The Descriptive Catalogue of Roses post-free.

THOMAS RIVERS & SON,
The Nurseries, Sawbridgeworth, Herts.

GEO. JACKMAN & SON

beg to offer a large and well-grown stock

of the following:—

FRUIT TREES—of the leading varieties suitable for Market and Private Gardens.

ROSES—Choice and Exhibition Varieties, selected Standards and Dwarf; also in pots for forcing.

RHODODENDRONS—of the best named sorts, well set with buds; also Hybrid, Seedling, and Pomme, for shrubbery and covert planting.

CONIFERS—A large Collection for Lawns and Pleasure Grounds.

SHRUBS—Ornamental and Flowering, adapted for Belts, Strabbers, Screens, &c.

TREES—Ornamental and Flowering, for Parks, Avenues, Streets, and Private Gardens.

FOREST TREES—For Coverts, Screens, &c., all grown by themselves.

CLIMBERS—In large variety for Walls, Trellises, Rockwork, &c., including their celebrated Clematis.

G. J. & S. have also to offer a NEW CLEMATIS—"MRS. BARON VELLARD"—a handsome variety of the Jackman type. It is a vigorous grower, bearing a profusion of distinct light lilac flowers, of medium size, from July to October. It can be highly recommended for its good qualities, and should be added to every collection. Price on application.

LANDSCAPE GARDENING—A leading feature. Plans made and estimates given for Laying-out Estates, Public Parks, Cemeteries, Private Gardens, and Pleasure Grounds.

The New Descriptive and Priced CATALOGUE, free on application.

 A SPECIALTY.

True strains and extra fine, in five separate colours—Purple, Scarlet, White, Crimson, and White Wallflower-leaved—each colour 1s., 2s. 6d., and 5s. per packet.
 Mr. GLEN, The Gardens, Brambletye, writes—"Please send me five packets East Lothian Stocks. I must say that your stock of East Lothian Stocks is the best I have seen anywhere. When I was at Westworth the beds of East Lothian Stocks supplied by you were admired by every one who saw them. They went upwards of twenty to the dozen, and were double-flowered."
 Mr. BATHUR, The Gardens, Luton Ho Park, writes—"The East Lothian Stocks from you were excellent. The white, purple and crimson exceptionally fine. Many spikes were over 18 inches long and densely clothed with bloom."
 Mr. LAZOV, The Gardens, Komnet House, writes—"Please send me four packets East Lothian Stocks. This year I have the finest I ever had. They are the admiration of every one who see them. The whites are over 90 per cent. doubles, which could not be better."
 All other seeds of the same first-class quality only, notably the following, all saved from my own world-renowned collections—
 PANSIES, show and fancy, 1s., 2s. 6d., and 5s. per packet.
 PENSTEMON'S, 1s. and 2s. 6d. per packet.
 ANTHRIMUS, 1s. and 2s. 6d. per packet.
 MIMULUS, 1s. and 2s. 6d. per packet.
 AURICULA, Alpine, 2s. 6d. per packet.
 Stage, 2s. 6d. and 5s. per packet.
 PRIMULAS, each colour, 1s. and 2s. 6d. per packet.
 CINERARIA, 1s. and 2s. 6d. per packet.
 COCKSCOMB, extra grand competition strain, 2s. 6d. per packet.
 BEGGARS, Single, 1s. 6d.; ditto double, 2s. 6d. per packet.
 Mr. ANDERSON, The Gardens, Abbeville, writes—"You will be pleased to hear that your seeds have done so well that I have not one single failure."

Mr. GLEN, The Gardens, Brambletye, writes—"Please send me five packets East Lothian Stocks. I must say that your stock of East Lothian Stocks is the best I have seen anywhere. Important to Everyone Interested in Gardening.

THE ILLUSTRATED GUIDE FOR AMATEUR GARDENERS, SPRING, 1890.

This superb work, enclosed in a charmingly printed Coloured Wrapper, contains 132 pages, imperial size, of beautifully printed letter-press, and upwards of 170 fine Wood Engravings, 2 splendidly finished Coloured Plates, original articles on the Rearing of Flowers from Seed and Culture of Garden Crops, a fine and Select List of Choice Kitchen Garden and Flower Seeds, Seed Potatoes, Flower Primulas, Lilacs, Gladioli, Roses, Ac., and all the Imp-riant Novelties of the Season. This will be found incomparably the best and most comprehensive garden Catalogue yet sent out.

Price 1s., Post-free. To be deducted from Order when sending.

DANIELS BROS., ROYAL NORFOLK SEED ESTABLISHMENT, NORWICH.

GOLD MEDAL.

Quite the most original CATALOGUE in the Trade, Terms and Prices certainly the best. Post-free to every applicant.

Every Gardener should see this List, because a number of exceedingly good things can only be had from us. We very urgently insist press gardeners to write for this List.

The New Japanese Primulas, the most startlingly remarkable flowers ever raised in this group. Destined to be as generally known as Primula-sinisensis. Most highly praised by every horticultural paper, and by the Times and London Press. Three Medals in three weeks. These are of such very special character, and will be so much talked of this spring, that every lover of choice flowers should see our full account of them in Catalogue.

Gold Medal for Tuberosus Begonias.—The cheapest in the trade. Every lover of good Begonias should see our List. We have been delightfully successful, and our strain is grand beyond all description.

Seeds that Give Satisfaction.—Our great strength as a seed firm, and the cause of the extraordinary growth of our business, is the splendid quality of our strains of flowers, and the frank rank reputation we have for Exhibition Vegetables.

£50 in Prizes and Two Medals are offered by us to our customers only, on so ingenious a plan that all can compete on fair and equal terms, wherever they may reside. All who can grow things well should see our Catalogue.

The best proof of our confidence that our terms and prices are of the best is that we send our Grand, Illustrated, Descriptive, Full Cultural note CATALOGUE, Post-free to every applicant.

RYDER & SON, SEED MERCHANTS, SALE, MANCHESTER.

WILLIAMS' NOVELTIES FOR 1890.

WILLIAMS' NEW VEGETABLE, EARLEY'S HARDY CURLED SPROUT.

This new variety was raised by Mr. William Earley, of Dorset, from whom we have secured the entire stock of this valuable Vegetable. He describes it as follows:—"A cross between the Brussels Sprouts and Kale, Scotch Curled. The latter was crossed with Brussels Sprout pollen. This has produced a robust variety with true Brussels Sprout habit, the foliage being midway between the two parents. Per Packet, 2s. 6d."

WILLIAMS' NEW ORNAMENTAL-LEAVED BEET.

(MCGREGOR'S FAVOURITE.)

Awarded First-class Certificate by the Royal Horticultural Society, September 25, 1888.

The leaves are of a rich, bronzy-crimson colour, arched, about 8 to 9 in. in length, and fold upwards, resembling in habit a narrow leaved Dracona. Per Packet, 1s.

WILLIAMS' NEW PRIMULA, "FIRE-FLY."

A beautiful semi-double variety. The colour is of a deep crimson, somewhat more intense in shade than "Meteor." It comes very true from seed, and will be found most serviceable for conservatory decoration. Per Packet, 3s. 6d.

WILLIAMS' NEW PRIMULA, "EMPRESS."

This is a very fine semi-double variety. The colour is a delicate pink, of a very pleasing tone. Per Packet, 3s. 6d.

Illustrated Seed Catalogue for 1890 will be forwarded, gratis and post-free, to all applicants.

B. S. WILLIAMS & SON, Victoria and Paradise Nurseries, UPPER HOLLOWAY, LONDON, N.

THE GARDENERS' CHRONICLE,
 Vol. VI., Third Series, JULY to DEC., 1889.
 W. RICHARDS, 41, Wellington Street, Strand, W.C.

THE
Gardeners' Chronicle.

SATURDAY, JANUARY 18, 1890.

A GARDENERS' PROBLEM.

I THINK you could hardly have commenced the new year with a more important subject for discussion than that raised by Mr. Thiselton Dyer. For my own part I think that though a great deal of what he says is perfectly true, yet that such opinions, coming from such a source, are likely to do much more harm than good to the gardeners, who would naturally look for inspiration to the Director of the largest, the best cultivated, and the most liberally conducted botanic gardens in the world. It seems to me that a knowledge of the climatic conditions under which plants grow is of the greatest assistance in guiding the cultivator of any new or little known plant; and though it is too often the case that from imperfect knowledge of the locality and range of the plant, or of the climate of that locality during the whole year, such information leads to mistakes, which are corrected by the empirical knowledge of other cultivators ignorant of these facts, yet this seems to prove only that a little knowledge is a dangerous thing. Mr. Dyer says, "We grow Peonies pretty successfully at Kew, yet we have Sir J. Hooker's testimony to the fact that our treatment is widely different from anything that the plants receive in the Himalayas." On this point I think further detail is necessary, because I have seen Peonies at all seasons, both on the Himalayas and at Kew, and I cannot follow him. He goes on to say, "The real fact is, that the plant as it occurs in nature, tells us but little of its innate qualities. These it may, unaided, never be able to take advantage of, and they can only be revealed by experiment. The constitution of the individual species, I am disposed to consider singularly inelastic, and bounded by limits which are not readily broken down when reached. But it is evident in a state of nature they are very frequently not reached." I am

very glad to see that he makes use of the word "constitution," as applied to plants, because I have always contended that the word constitution may be applied with just as much propriety, and in exactly the same sense to plants, as it is applied to animals or men.

Professor Huxley, in a paper on the Genians, published in the *Journal of the Linnean Society* in 1888, vol. xxiv., Botany, p. 123, says,— "We are very much in the habit of tacitly assuming that because certain plants and certain animals exist under certain climatal conditions, there is something in what we vaguely call the constitution of the plants or animals which binds them to these conditions, and renders it impossible for them to live elsewhere. I wish we could get rid of this word constitution, for I take it to be one of the many verbal anodynes by which the discomfort of ignorance is dulled. If it means anything definite, it means that there is some morphological or physiological impediment to the existence of the plant or animal outside the defined conditions, and our business is to find out what that impediment is."

At the time I read this remarkable sentence, I discussed it with three of the most eminent botanists and travellers whom I know—namely, Sir Joseph Hooker, the late Professor A. Gray, and Professor Sargent, of Boston, U. S. A., and found that they all agreed with me that no other word was so well suited as the word "constitution" to express the fact stated by Professor Huxley, and that it would be as difficult to find out what the impediment was, as it is for physicians to find out what is the reason why some members of a family, some families of a nation, and some nations of the human race are born with constitutions which enable them to resist, or to thrive under conditions which destroy or weaken other individuals, families, or races, not gifted by Nature with the same constitutions. As Mr. Dyer makes use of the word in the same sense as I do, I presume that he would not agree with Professor Huxley; but to say that the constitution of individual species generally is singularly inelastic, is to say what neither my horticultural experience nor my observations in other countries will allow me to concur in, the constitutions of many species being, I think, as elastic as those of many animals or men.

Mr. Dyer quotes the remarks of John Smith [primus], as follows:—"In our experience we have never found any plant thrive by retaining it in its native soil, or in soil too closely resembling it." Here is another half truth which I think would be most detrimental to horticulture if generally accepted and acted upon. I will give two instances to the contrary. I was informed by the late Mr. Leech, of Wandsworth, who was, I believe, the first, or one of the first, to cultivate successfully *Disa grandiflora*, that he had never succeeded with it until he grew it in the same black sandy peat as that in which it was imported, and until he imitated as nearly as possible, by placing it in an airy position and constantly syringing it, the damp atmosphere of the ravines in which it grows on its native Table Mountain. As long as he tried to grow it under the same conditions as other Cape bulbs and orchids which grow only a few miles away from the same spot, he utterly failed. I have never been able to grow *Cypripedium spectabile* and other N. American Orchids nearly so well as when I received them direct from Mr. Tringle, of Vermont, in large masses of their native decaying wood and sphagnum, and imitated as closely as possible the exact conditions under which they grow naturally. I distinctly re-

member handing over to the late Charles Green—who must be allowed to have been one of the most successful cultivators of difficult plants in England—some of the strongest specimens of these Orchids to grow as best he could by empirical knowledge, the result being that his plants flowered weakly and soon died, whilst mine remained, until their constitution was enfeebled by English summers, in a flourishing condition.

What gardeners have been too often compelled to put up with are at best imperfect, misleading, or incorrect accounts of the conditions under which plants grow naturally; and unsuccessful attempts to imitate natural conditions which cannot be imitated have no doubt led to many failures, and have caused skilful cultivators to rely rather on their empirical knowledge than on such information as they get from unscientific and inaccurate collectors or residents in foreign countries.

But I will maintain that, in this particular point of cultivation, the most success will be gained by a combination of botanical or scientific, and horticultural or practical knowledge. When I speak of botanical knowledge, I speak perhaps of something different from what is now in fashion, for it seems to me that the subordination of a knowledge of geographical distribution, variation, and systematic work, to a knowledge of physiological botany, which appears to be the tendency of modern botanical teachers: is calculated to disgust rather than to attract would-be students; and to check rather than to advance the spread of the most useful kind of botanical knowledge among gardeners. It may be possible for men like Professor Huxley or Mr. Dyer to study with advantage the morphological or physiological reasons for the existence of plants under certain conditions only, but I do not think it is possible for the working gardener, or even the botanical student of ordinary ability to do so. A really accurate knowledge of the climatal conditions and physical geography of all parts of the world, and of the distribution of families, genera, and species is much more easy to acquire and to apply, than a knowledge of the physiology and structure of plants; and is, when properly applied, likely to be of the greatest value to the gardener, not only in the mere details of cultivation, but by giving him a much greater interest in, and love of, the plants he grows. In conclusion, I can only hope that this subject may be discussed by gardeners who have travelled, as well as by those who have stayed at home. *H. J. Elwes, Preston, Cirencester.*

I have read Mr. Dyer's two very able papers on plant culture and the relations of botany to gardening with great interest, and in thanking him as a gardener for his observations, I should like to add a few words on a subject in which so many amateurs, as well as practical gardeners are now interested. Were I quite sure of the exact meaning of the words and phrases as used by Mr. Dyer, I feel certain we should be in entire unison on this subject. Mr. Dyer may be partly in the right when he tells us that—"Horticulture is essentially an empirical art," but it is true that—"Botanical science can afford but little *à priori* information as to the cultural conditions which any plant will require or will tolerate." True in part it is undoubtedly, but that it is not wholly true will be acknowledged by any one who has studied, or will study, Lindley's *Theory and Practice of Horticulture*, a work nowadays obsolete in many matters of detail, no doubt, but one in which the very first principles of gardening are enshrined. I fully grant that, while gardening may be to some extent empirical, it has been aided most materially by botanical science, and is being aided by workers in almost all the other so-called natural sciences to-day. In a word, I think the Editor of the *Gardeners' Chronicle* was fully justified in considering Mr.

Dyer's statements above given as being "too absolute." Granted that the gardener's art is empirical, and granted that he feels his way as described (on p. 16), in what way does the gardener's problem differ from that of a doctor on a foreign shore who has to treat a sick native, when neither doctor nor native can understand a word of each other's conversation? Experience of similar or analogous cases is all that either doctor or gardener can fall back upon after all. As to the culture of *Trichomanes* of the *T. crispum* group, if their hairy rhizomes are covered up or buried in any earth whatever, they rarely do so well as if their rhizomes are placed on the surface of the soil and held in position by lumps of soft sandstone, so that I do not wonder at Mr. Backhouse's *Trichomanes* failing when planted in "an almost clay soil." Again, there is that well-known habit of the roots of *Cattleyas* and other Orchids which so often, even if not invariably, decay if replanted deeply in fresh compost, but which live and thrive if the fresh compost is placed so that the new roots naturally thrust themselves into it when they protrude from the base of their new growth. When we are told that "Nature is, at the best, a very poor gardener," we must remember, or at least not forget, that, as a rule, she carries matters far past the point at which the gardener stays his hand. Nature's main point and strong point, where she is most successful, is reproduction by seeds. She fights a hard battle, and on her own lines has to do far more than the cultivator is generally called upon to do. How often it occurs in the garden that the vegetative organs of the plants cultivated are those all essential to the gardener or his employer? How rarely in the case of hothouse plants, indeed, of garden plants generally, the complete cycle of a plant's existence as a sexual creature is fulfilled? In Nature, nearly all plants must either seed or die. They often must do many other things besides, but seeding is the most essential charter on which their existence is irrevocably staked. My own experience of *Phalenopsis* and other tropical Orchids is practically this: Their flowers are rarely, if ever, seen wild, so beautiful, so perfect, so floriferous as seen in British hothouses. But this does not imply that the plants are less robust and healthy, since the contrary is decidedly the case. The flowering Orchid of a tropical forest is buffeted by drenching rains or rude winds, and the native insects visit and fertilise a large proportion of their flowers as soon as ever they are perfectly developed, so that they often present a woebegone and bedraggled appearance to the eye of a glass-house cultivator. In the Orchid-house at home there is no wind, no rain, no fertilising insect, and every bloom on the spikes opens pure and spotless, and endures fresh and lovely for a long time in expectation of that little winged messenger of love, the fertilising insect, that rarely or never comes! The *Kew Pleione*, good as they were from a vegetative, or gardener's point of sight, and in this way surpassing native specimens, no doubt, failed at a point where Nature is most exacting. They did not seed at Kew as they do on the mossy tree trunks or rocks of the Himalayas! In a word, I do far agree that cultivation and Nature do sometimes deal with problems which have scarcely anything in common. As to the power of toleration or adaptation to climate possessed by plants, we know how small it often really is, and have only to remember the many failures that have attempted what has been mis-called acclimatisation. But if a plant is hardy enough to seed in the open air when brought to these islands, we may generally expect some of the seedlings to be hardier than their parent, just as some of them will or may be hardier than others, and so some progress in a given direction is often gained. Experience, observation, cross-fertilisation, and selection, have long since, and can after all, do wonders in the garden, "empirical" as such operations may be! Seeing the results attained by such empirical gardeners as Downing, Court, Seden, Laxton, Kelway, Canill, Laing, Swan, and many others, I think we may fairly take Mr. Dyer's advice, and "not be deterred by botanical prepossessions." The propagator who successfully grafted the *Garrya* on to the shoots of the *Aucuba*, evidently was not troubled by any botanical considerations of the kind referred to, and the same might be said of the raisers of the so-called bigeneric Orchids and other plants now in existence. I am anxious to mention these so-called bigeneric hybrids, because they show that inelastic as such genera may be in nature they are less so in the cultivators' hands. Of course the cultivator can never create, he can merely give plants in a garden more variety—more

chances of development, than they have had in the forest or the field. I cannot agree that the constitutions of individual species are singularly inelastic, since we know that even in Nature they often overstep their bounds, a fact the botanist disguises by giving different specific names to groups of individuals which biologically are merely developments or phases of the same plant. Wide as may be the meaning of the word "species" as used by the lumpers of to-day, it will assume a much more comprehensive character if read by the light of a biological lump list in a good experimental garden. Instinct is after all a great gift; and one of almost prophetic importance, in those gardeners who, like some poets "are born" and "not made." I mean men like Knight, the late Dean Herbert, and many others who, like Darwin, were fond of experimenting with the living forces of Nature in the garden. After reading Mr. Dyer's two papers with great delight, I must say the moral to be drawn from them is a good one, and one that will recommend itself to all gardeners, instinctive, "empirical," or otherwise. It is this: If botanical science cannot assist the gardener as to the *a priori* cultural conditions necessary for him to employ in particular case or cases, it seems quite natural that the gardeners should be left to carry on their own work in their own way: Personally, I have received much assistance from botanists of all grades, and from the published works of Lindley, Masters, Moore, Knight, Herbert, not to mention many others all men of the *judicious botanist* type, even if not botanists proper; and I do not like the idea of kicking down the ladder up which I have climbed. In conclusion, I feel sure I am right in saying that all the more intelligent of gardeners will always welcome the brightest and best of light and leading, come from whom or whence it may. *F. W. Burbidge.*

NEW OR NOTEWORTHY PLANTS.

CYRIPEDIUM BUCHANANIANUM × Hort. Measures.

This is a hybrid raised in the collection of R. H. Measures, Esq., of Streatham, from *C. Druryi*, crossed with *C. Spicerianum*, and of which a flower and leaf have just been received at Kew. I am not aware that its characters have been before placed on record. The upper sepal is very broadly orbicular, the colours white, suffused with light yellow, a few purple splashes near the base, and a narrow dark purple median band. Petals light yellowish-grey, the upper margin undulate, and the same half of each petal bears several narrow purple-brown stripes; towards the base, on both upper and lower halves, are numerous purple spots. The lip is yellowish-grey behind, and has the same colour suffused with purple-brown in front, and it is densely spotted with purple inside. It has generally much of the shape of *C. Spicerianum*. The staminode, too, much resembles that of the same parent, although it is rather flatter; the colour is light purple, with a yellow centre. The characters of the pollen-parent preponderate everywhere, the most obvious character derived from *C. Druryi* being a decided trace of the yellow colour peculiar to that plant. It is certainly an attractive plant, and Mr. Measures writes me that he considers it, together with *C. Cythera* × and *C. Ilra* × (also received about the same time), as three of the best he has yet raised. *R. A. Rolfe.*

CYRIPEDIUM CYTHERA, n. sp.

A very pretty little plant, raised in the collection of R. H. Measures, Esq., of Streatham, between *C. Spicerianum* and *C. purpuratum*, the latter being the pollen parent. In general character it most resembles the mother plant, but in size it more nearly approaches the pollen parent. Singularly enough, the leaves are quite green, without any trace of tessellation—quite the reverse of what usually takes place when one parent belongs to the tessellated group; yet I believe the parentage is correctly given. The flower, like the whole plant beside, is small and neat, being only 3 inches in expanse. The upper sepal is very broadly ovate, with a broad dark purple median band, the base purple-brown, running into a clear purple suffusion above, and finally into a broad

white margin. The petals are light purple-brown above, and pale green near the base, with numerous small purple-brown spots; there is also a narrow median band of the same colour. The lip is small, pallid behind, and a little suffused with light purple in front; the interior is suffused with purple in front, and much spotted with the same colour behind. The staminode is much like that of *C. Spicerianum*, pale purplish, with a yellow centre, and a few green markings on the same. It is a very neat little plant, with bright and attractive colours. It would perhaps be desirable to infuse the dwarf habit of *C. purpuratum* into other hybrid *Cyripedia*, if this could be done without sacrificing other characters. *R. A. Rolfe.*

HYBRID CALANTHES.

The raising of *Calanthe Veitchii* ×, from *C. vestita* and *C. rosea*, was a veritable horticultural triumph, and the forerunner of a race of very handsome and useful autumn-flowering plants. We have now a white-flowered form, though I do not know exactly in what way it was obtained. *C. labrosa* is another species of the same section which has been utilised for hybridisation purposes, and which has given rise to two or three handsome hybrids. These have been again recessed, in various ways, with each other and with *C. Regnierii*, which perhaps is little more than a distinct variety of *C. vestita*, the result being a series of closely allied, but very handsome garden plants. I fear that the origin of some of these has not been carefully recorded, which is unfortunate, but in any case it is clear that they will have to be considered as florists' flowers in the near future. Four very handsome forms have just been sent to Kew by C. Winn, Esq., Selby Hill, near Birmingham, though I am not sure how far they differ from pre-existing forms. The first is said to be from *C. Regnierii* crossed with *C. rosea*, and thus should be very near *C. Veitchii* × (*C. Regnierii* taking the place of *C. vestita*); yet it is much more like one of the forms of *C. vestita*, both in shape and colour—perhaps, because the characters of *C. rosea* are nearly obliterated. The three others were raised from *C. Regnierii* crossed with *C. Veitchii superba*, and all from the same seed-pod, the seed being sown in May, 1886. No. 1 is of a bright rose colour, the segments shading off a little towards the apex, and the throat of a darker shade. No. 2 is paler, and the segments shade off more distinctly towards the apex into pale blush. No. 3 is nearly white, the lip being faint blush, with a rose throat and column. All of them are large-flowered and beautiful, but it is clear that if each must receive a distinctive name it should only be a fancy one, for they are as surely becoming florists' flowers as are tuberous-rooted *Begonias*, and some other plants which have only been taken in hand by the hybridist during recent years. Perhaps the nomenclature committee of the Royal Horticultural Society will recognise this fact, and shape its recommendations accordingly. Nothing but confusion can result from a contrary course. Already we have a *Calanthe rosea* (a wild species) and a *C. rosea* × (a hybrid—at least so we are informed in these columns at p. 43), and it is quite time something was done to prevent such confusion occurring too frequently. Returning for a moment to Mr. Winn's hybrids, it is very interesting to note how different are the three forms from the same seed-pod, and it appears there are three others whose flowers are not yet expanded. I am also informed that one of the plants flowered in the winter of 1888-9, which is a remarkably short period, from the time of sowing the seed. *R. A. Rolfe.*

PLANT NOTES.

NYMPHLEA VEISICOLOR or N. DAUBENYANA.

This, no doubt, is a form of *N. stellata*, and which is as far as I am acquainted with the genus, the most floriferous of all. With us it was the first of

the season to open its flowers, which are delightfully fragrant, and it has been flowering without intermission from that time to the present time of writing.

It is a readily distinguished variety, from its habit of bearing young plants from the centre of each, and while visiting last autumn the garden of Chatsworth, I noticed amongst their very effective collection, plants bearing young ones upon their leaves which were bearing flowers, while still attached to the parent plant, making a very striking effect, the flowers averaging about the size of a two shilling or half-crown piece. The flowers are of a lighthouse blue with a tinge of red, leaves detached from the plant and pegged on to a pot of soil, soon become established and commence to flower, and in this stage of growth they make neat specimens for small aquariums, or may even be grown in inverted bell glasses. *W. Harrow.*

JACOBINA COCCINEA.

This plant is seldom seen in cultivation, although it was introduced as long ago as 1770 from South America, and received at one time a good share of attention. For a long time it went in gardens under the name of *Aphelandra cristata*, though upon examining the structure of the flower this mistake became evident, for while *Aphelandra* has four stamens and one-celled anthers, the plant in question has but two stamens, with two-celled anthers. It is a beautiful flowering stove plant for the winter. The scarlet flowers are produced in terminal spikes, and the plant varies in height at the time of flowering according to the time of year when the plants were propagated. It is a good plan to take cuttings at three or four different times, from March onwards, and by so doing a double purpose is served, the plants being of different heights, and the blooming period much extended. Cuttings root freely in a gentle bottom-heat under a bell-glass in about ten days to a fortnight. When rooted they should be potted into a loamy mixture, and placed near to the glass to prevent drawing, giving them an occasional syringing during the day. From these pots they may be put into their flowering pots, viz. 48's, or 32's, using the loam in a more turfy condition growing them on in a warm pit or frame, and as they advance in growth a dose of weak liquid manure may occasionally be given, or some Cay's fertilizer and guano mixed together scattered over the surface of the soil. They should not by any means be stopped, or the heads of flowers will be weak and unsatisfactory. The insects which infest the plant, scale and mealy bug, should be removed before the plants come into bloom. *W. Harrow.*

BEGONIA SOCOTRANA.

It is impossible for this winter-flowering species to become too widely known and grown in gardens. It is very distinct in habit, and beautiful in aspect, bearing numerous bright rose-coloured flowers, which last a long time in perfection. The male flowers measure some 2 inches in diameter, and the females are smaller. A full-grown leaf averages some 7 inches in diameter, is of a thickish texture dark green, with a funnel-shaped depression in the centre; the veins are prominent below, and hairy, as are the petioles, which are stout. At the base of the stems numerous bulbils are formed, from which the plant is readily propagated. The height of the plants at the time of flowering measures some 12 inches. Unlike the majority of *Begonias*, this requires resting during the summer, which is best done by keeping the plants dry. During the month of September or October the plants should be examined, repotted, if the soil is exhausted, in a mixture of good yellow loam and sand and leaf-soil starting them in a warm-house, keeping them while growing as near the glass as possible, and shading them from bright sunshine, giving an occasional syringe overhead during the day. *W. Harrow, Botanic Garden, Cambridge.*

A HISTORY OF ENGLISH GARDENING.

(Continued from p. 687, vol. vi.)

NEAR the end of Henry VIII's reign, the royal palace of Nonsuch, near Ewell, in Surrey, was built, and the gardens, which were justly celebrated in later times, laid out. "The palace," writes an old chronicler describing Nonsuch, "is so encompassed with parkes full of deer, delicious gardens, groves ornamented with trellis-work, cabinets of verdure, and walks so embowered by trees, that it seems to be a place pitched upon by Pleasure herself to dwell in along with Health." The residence was designed by an Italian architect, and the gardens were in all probability laid out under the direction of the same individual. They do not, however, appear to have been designed in the purely Italian style, but they decidedly show traces of Italian influence. They may be described as a combination of that style with the old English; the ground plan was essentially English, the ornaments, statues, vases, and pyramids of marble, Italian. No vestige of the original palace or of the gardens now remain, but two contemporary descriptions * have been preserved, from which a fairly accurate idea of what the gardens were like can be formed. "The house," we read in one of these descriptions, was "one fayre, stronge, and large structure or building of freestone of two large stories high, well wrought and battled with stone, and covered with slate." The terrace in front of the palace was "rayled with stronge and handsome rayles, and ballasters of freestone," which "added much to the beauty of the house." Before this terrace, and "about eighty yarls distance from the same, was a neat and handsome bowling-green, lying much what upon a square, and rayled with good postes, railles and lattices of wood." The Privy Gardens were situated at the back of the palace, and were "compassed round with a brick wall of fourteen foot high, and cut and divided into several alleys, quarters, and rounds, set about with thorne hedges." They also contained "many columns and pyramids of marble, two fountains that spurt water one round the other like a pyramid, upon which are perch'd small birds that stream water out of their bills." The "Grove of Diana," mentioned so frequently in after times, was also planted in Henry VIII's reign; it was situated to the west of the Privy Gardens, and formed one of the favourite resorts of the "bluff monarch" in his latter years. It contained "a very agreeable fountain with Actæon turned into a stag, as he was sprinkled by the goddess and her nymphs." There was also in this grove "a pyramid of marble full of concealed pipes which spurt upon all that come near."

DURING Henry VIII's reign, several other fine gardens were laid out in this country by the great monarch's subjects. Indeed, it was but natural that the courtiers of such a king should vie with each other in erecting sumptuous houses and laying out beautiful gardens in the provinces where they were seated. Wolsey laid out the gardens at Hampton Court, at Battersea,† and at York House (afterwards Whitehall); Edward Stafford, Duke of Buckingham, in his palace and gardens at Thornbury, in Gloucestershire, almost rivalled the cardinal, and perhaps might have done so entirely if he had not been hurried to the scaffold before they were fully completed. The gardens adjoining the castle at Grimsby, in Lincolnshire, were laid out under the direction of the Duke of Suffolk, and those at Kenninghall, Norfolk, and at Mount Surrey, near Norwich, by the Earl of Surrey;‡ Numbers of gardeners were necessarily employed to keep

in order these old Tudor gardens, and the accounts of this period which have been preserved show that they were not ill-paid. A head-gardener's salary at this time averaged between £8 and £10 per annum. Under-gardeners received generally about 3s. the week, and common labourers 3d. or 4d. the day.*

Numbers of the rural community were also employed in market gardening. Extensive gardens for the cultivation of vegetables and fruits for the market were very common, and if we may judge from some of the accounts which have been handed down to us, this branch of gardening was exceedingly profitable. There is an account, for instance, of a cherry-orchard of thirty-two acres, situated at Teyham, in Kent, which in the year 1540 produced fruit that sold for £1000—an immense sum in those early days.† This orchard be-longed to a certain "Harris, gardener," and it was also celebrated for its produce in later times; for Drayton thus alludes to it in his *Polyolbion*:—

"Rich Tenham undertakes thy closet to suffice
With cherries." *Song xviii.*

Market gardens for the supply of vegetables for town consumption were usually situated a little distance out of London; some, however, were planted out in the heart of the city itself. Thus Stowe, in his *Survey of London*,§ tells us that "about the latter part of the reign of Henry VIII., the poor people of Portsoken Ward, East Smithfield, were hedged out, and in place of their homely cottages, such houses builded as do rather want room than rent, and the residue was made into a garden by a gardener named Cawsey, one that serveth the market with herbs and roots."

Nursery gardens also appear to have been in existence in this country in the earlier half of the sixteenth century. Large quantities of garden plants were cultivated for stocking the newly laid-out gardens. We read, for instance, in the Chapter House Accounts for 1533, of some 500 Rose trees, and 31 bushels of Primrose, Violet, and Strawberry roots, besides large quantities of Quicksets and Rosemary bushes being bought for planting in the gardens of Hampton Court. Such quantities as these could hardly have been grown in private gardens, but were, in all probability, cultivated for the market. Orchard trees were also reared in nurseries, and one of these is mentioned in the Chapter House accounts as belonging to "a gardener of S. Jones Street, London."§

It is interesting to note that in Henry VIII's reign the first Herbars written in the English language were published. The first was the *Crete Herbar*, and this was printed in 1526. Two years later appeared a translation of Macer's well-known *Herbar*. In 1548, Turner published his interesting little volume, *The Names of Herbes*, and this he followed up nine years later by *A New Herbar*, printed in black letter, and profusely illustrated with woodcuts. These works, though written for the use of herbalists and apothecaries, nevertheless throw some light on the gardening of the period immediately preceding Elizabethan times, but the only work on practical gardening, published prior to the accession of Elizabeth, was that written by Thomas Tasser, and entitled, *Five Hundred Points of Good Husbandry*||

This little work is full of valuable hints on gardening matters, and the quaint way in which it is written makes it very interesting reading. It is written in verse, and is divided into twelve parts, each part containing directions for the use of the practical gardener for a month. The first section is headed September, and the author directs that Barberries, Raspberries, Gooseberries, and Roses * and

such as those" should now be planted out. The best time for trenching the garden was November:—

"If garden require it now trench it ye may,
One trench not a yard from another go lay."

If, in December, the frost was exceptionally severe, Tasser says that you should—

"Take this for a law,
The Strawberry look to be covered with straw,
Laid overly trim upon crotchis and bows,
And after uncovered as weather allows.

The gileflower also, the skillful do knowe,
Do look to be covered, in froste and in snowe,
The knot and the border, and Rosemary gaie,
Do crave the like succour for dyeing awaie."

January was the month for digging the garden, and pruning the fruit and Rose trees. One might also "set (as for a daintie) the Runcial Pease." In February these latter were to be carefully attended to, and, says Tasser—

"Sticke plentie of bows among runcial Pease,
To climber thereon and branch at their ease."

March was the month for grafting fruit trees, and also for making "readie the plots for seeds and for the pots." April was the time for sowing garden seeds, and Tasser recommends the gardener to "frequently dig and weed," for this, says he, "makes herbs the more wholesome and greater to be." Tasser also gives minute directions for gathering garden beans:—

"Not rent off, but cut off ripe beane with a knife,
For hindring stalks of hir vegetive life,
So gather the lowest and leaving the top
Shall teach thee a trick, for to double thy crop."

P. E. X.

(T. B. continued.)

ARABIAN COFFEE.

THERE is nowadays no question that Coffea arabica is of African origin. Its natural habitat seems to be the country of Gallia and Harrar. The plant was introduced into Yemen at the date of the Abyssinian conquest, and the downfall of the Himyarite Empire, about a century before the era of the Hegira. The culture of Coffee rapidly spread in all the western parts of Arabia Felix—that is to say, in the regions subject to tropical rains.

The system of cultivation has not altered for centuries, and the plantations of Coffee-shrubs on horizontal terraces on the mountain sides are to-day still like those of which Niebuhr wrote, more than a century ago. The natural slope of the ground is sometimes very steep, consequently the walls of rough stones which sustain the terraces are built up to a height of from 20 to 25 feet, which is equal to, or even more than, the width of the terrace itself. This arrangement ensures perfect drainage, which is very salutary for such plantations. The soil is carefully prepared, and is almost always shaded by large trees (Ficus, Tamarindus, Ehretia, Dobera, &c.), planted in a row. Many plantations are irrigated during the dry season by means of reservoirs placed on a level with the highest terrace, and fed by the deviation of a spring or neighbouring stream. The plants are generally supplied from nurseries, and are obtained from seed. The seeds, before being used, receive a certain preparation which consists in the removal of the pulp, and the submission of the seeds to a slight drying in a layer of ashes. They are sown from October to December, in borders of good soil, enriched by cow or sheep dung. The seedlings are shaded from the extreme heat of the sun by a covering of houghs, and are watered at least once a week. At the end of six or seven weeks the young plants are carefully picked out and removed, wrapped in mats, to the prepared plateaux. The Coffee shrubs are planted in lines about 30 to 40 inches apart, they are watered once a fortnight, and the soil is manured before necessary. From two to four years must elapse before the shrubs begin to bear. In Hariz, some growers consider that plants obtained from natural seed-plots are more vigorous than those germinating from seeds submitted to the process above described,

* See Heortzner's *Travels*, published 1585, p. 277, and *Archæologia*, vol. v. p. 43.

† Brewer's *Letters and Papers of the reign of Henry VIII.*, vol. ii. No. 1203.

‡ I omitted to mention whilst enumerating the royal gardens belonging to Henry VIII., that situated within the walls of the Tower of London. The "keeper" of this garden received 6d. a day in wages (Brewer's *Letters and Papers*, vol. ii. No. 1588). Another royal garden is mentioned in the *Calendar of Payments of Henry VIII.*, for 1548. It was situated at Woodstock.

* See Brewer's *Letters and Papers*, &c., vol. i. p. cxxiii.

‡ Ed. 1598, p. 139.

§ Chapter House Accounts, 1533, C. 2, l. 41.

|| The first edition of this work was issued in 1557. It has since gone through a large number of editions, and has only quite recently been reprinted.

The natural seed-plot is managed thus:—Many of the berries, when fully ripe, are attacked by birds, which eat the fleshy part of the pericarp (the pulp). The stone covering the seeds is thus laid bare, becomes detached from the plant, and falls to the ground. The cultivator examines the plantations every day, and hastens to lightly cover over these seeds on the place where they have fallen. They do not germinate for two or three months, but the young plants are said to grow to a height of from 12 to 15 inches in the first year, and to continue to develop rapidly. It is known that the pulpy portions of the fruits, dried in the sun and pounded, constitute a material used for the preparation of a stimulating beverage, possessing analogous properties to an infusion of tea. This warm draught has a very pleasant flavour when it is properly prepared. Scented with ginger or some other spice it is, with "Qit" (leaves of *Catha edulis*), a favourite stimulant with the Arabs of Yemen, who do not use Coffee, as do the Turks and Europeans. Everywhere, in the sandy solitudes of Tehama as well as on the steep summits in the Gebeli district, is raised the "Mikay"; this is a hut made of branches, or a shanty of rough stones, often far away from any populated centre, where is sold, in default of any more substantial fare, the decoction of gischeb, known as "gafal," which is always to be had fresh, from earthen jars with long necks and large rounded bases.

The fruits of the Coffee trees, dried in the sun, arrive from the interior in their natural condition, in bags of matting. In the centres of exportation, the most important of which is the port of Hodeidah, the gafal is submitted to a process which is intended to separate the seed from the pulp. The operation is conducted by means of millstones moved by hand, which is very fatiguing work, and must necessarily be replaced by perfected machinery as soon as ever hand labour becomes dear. For some time past, mortars of English manufacture have been used at Aden. The material thus pounded is estimated to consist of 50 per cent. of the seeds proper, 35 per cent. of pounded pulp, 12½ per cent. of powder yielded by the stones, and 12½ per cent. of waste produce. The commercial value of the prepared seed is at the quay of Hodeidah from about 47 to £5 for 220 lb. *Translatio ferax "Voyage en Yémen," by A. Deffès.*

SACRED TREES OF THE HINDUS.

During the marriage ceremonies of a Hindu, the branch of a tree is brought into the house, and placed in a *sup*, or winnowing fan, and this branch is the first object of worship. The tree used for this purpose varies in different castes. The *Ficus glomerata*, or *Udmulra*, is also called in Sanskrit *Vijaya*, or sacrificial *Parvitra*, or *paritra*. The baton or staff of the warrior or king is, according to the Brahminic faith, obtained from it. It is a cosmogonic and anthropogenic tree typical of the heavens and of the Supreme Intelligence, the true *Bramavriksha*, or tree of the Brahmin. The *Ficus Bengalensis* or *Vata*, is also a cosmogonic and anthropogenic tree; it is named *Upasthapatra*. This is the tree of the Roas, who consider themselves, rightly or wrongly to be of Kshatri origin. They pay great reverence to the tree, and will not eat from plates made of its leaves. The staff of the Brahmin is obtained from it. Thus the two highest castes of Hindus make use of Fig trees as their anthropogenic trees, and in all Aryan countries the Fig tree has, at all times, been considered as pre-eminently the cosmogonic and anthropogenic tree. It is only in countries where no species of Fig is found that another tree has been originally substituted for it. The reason of this appears to lie in the peculiar structure of the fructification of the genus, which was thought to produce a fruit without flowers.

The Vai-hya caste use the Ashoka or Ashapala

* Journal of the Anthropological Society of Bombay, By Brigide Surzeon W. Dymock.

(*Saraca indica*) sacred to Vishnu, and worshipped on the Ashokashtami or 8th day of the light-fortnight of Chait (March-April), when it is in flower. Part of the ceremony of that day consists in drinking water in which Ashoka buds have been placed. The Boi caste of Behar, and the Sonar caste use the *Palasha* (*Batea frondosa*); the first are devotees of Kali; the wife of Shiva, also known as *Parvati*, *Bhawani*, *Durga* or *Devi*. They offer a he-goat to the goddess along with the flowers of *Palasha*, the bunches of which are likened to the bloody hands of Kalis girdle. The gold-miths are worshippers of Shiva and *Parvati*, and associate its bright-coloured flowers with red gold. *Palasha* is addressed as "glorious," "treasurer of the gods and of sacrifice."

The Powars, a tribe of Rajput origin, a fire born race, use the *Khadira* (*Acacia catechu*), a tree remarkable for the hardness of its wood. In *Rigveda III. 35*, Indra is told to obtain strength by covering himself with *Khadira* wood. The tree is sacred to *Bhawani*, the wife of *Shiva*. The *Marathas* (that is the caste of this name) use the *Kalamba* (*Anthocephalus calamba*), as a *Medh*. It is a Buddhist and cosmogonic tree especially sacred to the wife of *Shiva* (in her form of *Durga*), and the leaves are offered to her at the *Durga-puja* or *Dassera*. It has orange-coloured flowers in the shape of a ball. The *Arka* (*Calotropis gigantea*) is the *Medh* of the *Wadwals* and *Bhandaris*, the first are gardeners, who water and take care of the Palm plantations, the second are those who extract the Palm juice. *Arka* or *Arkapatra* having leaves like lightning, *ie.* canaliciform, is sacred to *Indra*, the Indian *Jupiter*, the god of winds and showers. He is described as strong and drunk with wine, and is attended by the *Maruts* or winds, who roar amongst the forests, and drink intoxicating drinks. The *Wadwals* and *Bhandaris* specially worship *Maruti*, as the well-being of their Palm plantations depends to a great extent upon the absence of high winds, and the abundance of water. In the towns of late years many of the *Wadwals* have become educated, and have abandoned *Maruti* for the fashionable god, *Shiva*; they have consequently taken the *Mango* for their *Kulpalak*, and follow the customs of the *Panch-kalshas*, *Sutars* of *Bombay*.

To explain the reasons for the use of different trees by all the numerous castes of India would fill a volume. . . . To sum up, it appears that in every Aryan country at least, owing to the analogy between trees and men, popular superstition supposes the first men to have sprung up from trees. Children are told in Europe that they were found in a garden or under a Gooseberry bush; in the *Bundhesh* the first man and woman are said to have sprung from a Gooseberry bush. The tree, *Ashvattha* (*Ficus religiosa*) is the earthly emblem of the celestial tree, the heavens, or source of Universal Life, the real *Baldhidruma*. In India, the two higher castes have adhered to the genus *Ficus* as representing the generative powers of nature; other castes have selected different trees sacred to the particular *Deva*, or *Devi* worshipped by them. In Europe the Fig formerly, and the *May* and *Myrtle* now, are the favourite anthropogenic trees, and though not now worshipped they still retain a symbolic importance.

A TREE SOLANUM.

About thirty years ago the late Mr. Bentham described specimens of a *Solanum*, received from the island of Hongkong, under the name of *S. Wrightii*, after Mr. C. Wright, botanist to the United States North Pacific Exploring Expedition, who collected the specimens in question. Mr. Bentham (*Flora Hongkongensis*, p. 241) states that it was with much hesitation that he published a new species of a genus so vast and confused as *Solanum*, but he had failed to match it with any other specimens in herbaria, and it did not answer to the description of any species in Dunal's monograph of the genus.

Ten years later the late Dr. Hance, to whom we are so greatly indebted for advancing our knowledge

of the flora of China generally, published (*Journal of the Linnaean Society*, xiii., pp. 95-144) a supplement to Bentham's *Flora Hongkongensis*, wherein he says that "this very fine species of *Solanum*, which forms an erect tree about 15 feet high, is certainly not a native of Hongkong." Subsequent travellers have verified this statement, and the only other specimens received at Kew thence were taken from the garden of the Murray Barracks by Colonel Urquhart, who notes that it was called the Potato-tree, and flowered all the year round.

Having reached the *Solanaceae* for the *Indo-China Sinensis*, I had to deal with this highly ornamental *Solanum*, whose native country was till now unknown, and I have succeeded in tracing it to South America.

Meanwhile, it appeared in French gardens, and Mr. Carrière published a description of it, accompanied by a coloured plate (*Revue Horticole*, 1867, p. 132), under the name of *Solanum macranthum*, a name, he was careful to point out, it bore in gardens. Concerning its origin, he knew nothing, but suspected it might be Asiatic, because it was cultivated by a friend at Cairo, where it succeeded admirably, forming an ornamental tree of the first order.

Although a native of a subtropical region, I thought it might be worth while directing attention to this plant, which I do not remember to have seen in English gardens, where, however, it might succeed in summer. Furthermore, there are many readers of the *Gardeners' Chronicle* who reside in countries where it would flourish in the open air all the year round.

It is one of those species having very large, lobed leaves, armed with a few scattered prickles, and the flowers, which are about 3 inches in diameter, and borne in clusters, vary in colour from white to an intense violet-blue, with large bright yellow anthers, much like those of the Potato, suggesting the name of Potato tree, by which it was known in Hongkong.

Mr. Carrière describes it as a small tree, from 4 to 6 metres high, very ornamental, both in foliage and flowers, and easily propagated from cuttings in summer and winter, though preferably from seed when obtainable. Plants thus raised in heat in the winter may be put out in the open ground as soon as there is no longer danger of frost. Placed in highly manured ground, and copiously watered in summer, this *Solanum* succeeds well in France, and is a very effective plant in the subtropical garden. Including the stout stalk, the leaves attain a length of 3 feet, and are proportionately broad, and even in the absence of flowers the plant is sufficiently ornamental to deserve a place where the conditions are favourable.

In a genus of between 700 and 800 species, it was difficult to decide where to turn for our plant; but, guessing from its general character that it was South American, I looked through the 500 or so species from that country, and found its exact counterpart in some specimens collected by Mr. Pearce in woods on the banks of the Amatala river, at an elevation of 4000 to 5000 feet. The exact position of the locality I have not yet ascertained; but Messrs. Veitch, for whom Pearce collected, and to whom I applied, kindly informed me through Mr. Kent, that there is an Indian village of the same name about two days' journey from Santa Cruz in Bolivia.

This species is readily distinguished from its nearest relatives by the tail-like prolongations of the bristly sepals. Another remarkable character, though not peculiar to this species, is found in the hairs of the leaves, which on the upper surface are coarse, and mostly simple, while on the under surface they are softer, shorter, denser, and stellate.

I may add, that the plant figured in the *Botanical Magazine* (plate 4138) as *S. macranthum* is not the same species, nor is it the true *S. macranthum* of Dunal, but *S. maroniense* of Poiteau. All these species are, however, somewhat closely allied, and belong to a section of the genus numbering about 100, chiefly American.

Dr. Trail collected specimens of a *Solanum* in the

upper Amazon region, so like the present in foliage, that it might be taken for the same in the absence of flowers, which are, however, much smaller, with a totally still-point calyx.

Mr. Pearce describes the wild plant as a tree 30 to 40 feet high, with violet-blue flowers.

So far as I can ascertain the species was not described by Dunal, though given Benthams name, S. Wrightii, will stand, though given to specimens cultivated on the other side of the world. *W. Botting Hensley*. [Our illustration, fig. 13, is copied partly from the representation in the *Revue Horticole*. The outline of the leaf in the background is taken from a native specimen. Ed.]

GROUPS OF CHRYSANTHEMUMS.

I WILL say at once that I am not an exhibitor of Chrysanthemums, and have never felt the hopes and fears of the exhibitor of that flower; still the layman may have his likes and dislikes, and my pet dislike is the group as one sees it at every show in every part of the country. What meaning is conveyed by a heap of lanky plants with a few big or little flowers at the top, and which may cover a space of 50 or 100 square feet? Not good culture, for hardly one of the plants composing a group is capable of standing alone, in spite of the sticks to which it is fastened by numbers of ties; certainly not the production of forms of beauty in the way of many fine blooms and plenty of healthy leaves, for of the former there are but few to be found on a plant, and the latter are conspicuously absent. We are notoriously lacking in ideas, and I wish we could import some Japanese gardeners, they at least would bring new ideas as to culture, training, propagation, and other matters. Now having had my growl, it is proper that I should endeavour to mollify the enraged grower, by showing to him the road he might, with advantage, take. Many will think it is sadly wanting in appropriateness, but still the truth must be said, that the curators of the botanic garden at Kew have pointed out the route to be taken by all those who would try to meet the improving taste of the day in these matters. At the Chrysanthemum Centenary Conference at Chiswick, groups of plants were solicited, and a good number were put together in response to this, but the best of them in the opinion of myself and others was that furnished from Kew. The number of the plants was not large, and they were mostly of one height; they were loaded with flowers and leaves, might have been thinned in the bloom slightly with advantage to their general effectiveness, and they were not much fettered by ties and stakes; in fact, some were most heretically lop-sided—what of that, when they looked all the better for it, and were more satisfactory objects for admiration than the ghosts of plants in the remaining groups.

The amount of space for a group was a fixed quantity at Chiswick, as it is elsewhere, but Kew did not seek to place as many as it could within that space, but to see how few it could comfortably fill it with without crowding; and it succeeded admirably, one being enabled to see almost all round the plants. That was the *best ideal* of a group, and a few more such would be welcome innovations at future shows, the only improvement required being in the direction of a lesser degree of looseness in the training; and there need be no fear that such a group would be considered ineffective because of the fewness of the plants of which it consisted, if varieties which contrasted well with each other were skillfully chosen. A group-space of 10 feet by 10 feet gives 100 square feet; and allowing two-thirds of a square yard = 6 feet to one plant, sixteen well-grown, bushy plants would very well furnish such an amount of space without undue sparseness.

What exhibitors of groups are doing now is, employing their plants, grown to one or two stems for supplying cut flowers for the exhibition stands, as fitting subjects wherewith to form a group. This is an error, and defeats its intention by so doing. A *melange* of colour only is obtained, but no striking feature, and worse than nothing, if excellence of plant cultivation is the aim of show managers. Do

away, therefore, with the group as at present set up, and confine exhibitors to a given number of plants for a fixed area and we shall see great improvement in groups. A. J. E. [Excellent advice! Ed.]

A PLAN OF GARDEN AND GROUNDS. (Fig. 12.)

This plan represents the grounds of a gentleman's residence, situated at a few miles distant from the metropolis, and laid out recently by Mr. T. Baines. The house stands on an eminence, from whence extended views to the west and south-west, over a wide tract of rich grass-land, interspersed with fine old timber, are obtained. The ground falls away gently on the eastern side, and a little more so on the west, where, at the road shown, it is about fifteen feet lower than the mansion. The wood abutting on the lawn on the eastern side, with the walk winding through it was already in existence, and consists of Scotch Firs and Spruce, intermixed with common deciduous trees, and is alike useful in winter in breaking the cutting winds, and as giving an agreeable shade in summer.

There are a good many old trees, consisting of Elms, Chestnuts, Limes, and Scotch Firs, scattered about the grounds. These may be easily distinguished in the plan by their larger proportions. It would be difficult to over-rate the advantage which the presence of a sufficient number of big trees is to the appearance of a newly-made place, where of necessity those that are usually planted require many years before they have the desired effect.

In speaking of effective planting of grounds adjacent to a dwelling, be it a villa with a few acres of land attached, or those surrounding a mansion of an imposing character, it is often, and justly said, that the planters of the present time have a great advantage over those of former days, inasmuch as there is now an all but unlimited number of species of trees and shrubs from which to choose. Yet this multiplicity of subjects has not always been turned to advantage by the landscape gardener. With trees and shrubs, as with other plants, the temptation to use new kinds, whose ability to preserve a good appearance after the lapse of years was uncertain, has often been strong enough to cause the older, well-proved kinds of trees to be neglected. The result of this mistake may be seen in many places, especially as regards the numbers of newer Conifers planted, not a few of which have turned out unsatisfactory, or not to be depended upon. Still, the partial failure of Conifers has not in all cases been an unmixed affliction, for they have frequently been used to the exclusion of a fine deciduous species, the outcome of which was a want of diversity in light and shade, of form and colour; a monotonous gloom prevailing instead. This gloomy appearance where the evergreen kinds are too numerous, is most apparent in winter, at which season if they are used with judgment, their presence is most needed.

IRIS BAKERIANA.

ONE has to put a break on one's garrulity when one writes for the *Botanical Magazine*, otherwise, in describing this Iris, I might have said many things which I did not say.

I might, for instance, have pointed out that it varies a good deal. The yellow mid-streak on the fall, is conspicuous in some, slight or absent in other specimens; the yellow tinge on the basal portion of the claw of the fall seems more constant. The size and number of the violet spots, the amount of the violet edging, and the evenness of the inner margin of this also vary. Further, the plants vary much as to the size of the bloom and the pointedness of—indeed, the general shape of the lamina of the fall, and in tint as well as in brilliancy of colour. I would not say, as Mr. Lynch suggests, that there are two forms, but rather that there are several; these, however, do not merit distinct names, even for garden purposes.

I received bulbs from the Rev. Mr. Gates in 1887; these flowered in 1889, not earlier than February and March, though protected by a frame, and bulbs received

from my friend, Mr. Max Leichtlin, at the end of 1888, flowered at about the same time. I forget which lot furnished the plant I sent to Kew. This season it must be remembered is wholly abnormal as regards the time of flowering of spring bulbs; and the bulbs of I. Bakeriana, which came to England from Mr. Max Leichtlin last summer and autumn, after having been thoroughly ripened, met, soon after being planted, with heavy rain, were early started into growth, and rapidly pushed on to flowering by a mild winter.

I hope in future years this Iris will not bloom so early, for its beauty needs bright sunshine, and the other glad accompaniments of spring; and I venture to think that those who have only seen the flower at Christmas cannot fully appreciate its worth. Those who have seen a fully expanded clump in calm, bright sunshine, will, I feel sure, be of opinion that I have done well in choosing the name which I have given to it.

I ought to have found room, even in the *Botanical Magazine*, for one statement. The plant first became known to me through the kindness of Mr. Gates; but it has become known to others through the energy and enterprise of Mr. Max Leichtlin. It is he who has really introduced the plant. *M. Foster, Shelford, Cambs, January 11.*

ONION EXPERIMENTS.

AMONG the many interesting and most valuable horticultural experiments initiated by the Directors of the New York Agricultural Station, with which we have been favoured, not the least is the report of that upon Onions.

The following selected list of ten varieties of Onions were planted on April 14, two rows of each name, 12 feet long, the rows being 21 inches apart. The bulbs of one row of each name were thinned when they began to crowd, to 1 inch apart from bulb to bulb; the other row was left without thinning.

The number of bulbs, weight of Onions per row and weight per 100 bulbs, with the average of all are given in the following Table:—

Variety of Onions.	Thinned Row.		Unthinned Row.	
	Number of Bulbs.	Weight of Row, Calculated per 100 Bulbs.	Number of Bulbs.	Weight of Row, Calculated per 100 Bulbs.
Early Red Flat ...	66	Oz. 134 253	145	Oz. 203 140
Early Red Globe ...	78	157 201	142	233 109
Flat Madeira ...	89	240 300	184	308 216
Giant Rocco ...	65	371 573	97	407 420
Nastey's Mammoth ...	79	169 211	144	271 190
Late Red Globe ...	91	155 183	131	189 111
White Flat Italian ...	95	193 203	110	210 191
White Portugal ...	81	125 161	161	232 130
Yellow Globe Danvers ...	71	149 201	181	266 145
Strasbourg ...	73	156 118	111	156 111
Average ...	79	191 237	141	255 182

Summary of the foregoing Experiments.

	Number of Bulbs.	Weight of Row.	Calculated per 100 Bulbs.
		Oz.	Oz.
Thinned rows ...	79	191	237
Unthinned rows ...	141	255	182

From these results we learn, that on the average of all the varieties of Onions treated, the unthinned rows contained sixty-two more bulbs than those that were submitted to the thinning process, and that the total weight of Onions obtained by the unthinned method was an average of 61 oz.—equal to 4 lb. per row in excess of those that had been thinned. On the other hand, the thinned rows, as might be expected, contained much the largest bulbs. One hundred Onions from the thinned rows weighed on

the average 237 oz., while a similar number from the unthinned rows weighed on the average but 182 oz. — a difference of 55 oz., equal to 3 lb. 7 oz. per one hundred bulbs in favour of those thinned.

These figures undoubtedly show that excessive thinning of the Onion bed in the average of seasons is not required in growing the main crop; but when large bulbs are required, the matter is different, or even in very wet seasons too great a crowding of the bulbs is not desirable, as the matting of the "flags"

Valley, Pinks, and Violets, also Cyclamen, Tulips, Chinese Primulas, Syringa (Lilac), and Camellias. Nor were Roses the only flowers to be found. There were Roses from the Riviera, large yellow Chrysanthemums of the Leucanthemum group, bright scarlet Poinsettias, and many other kinds. The mild winter of this year has been a great advantage to gardeners, and I never before saw such fine well-grown Hyacinths as we have had this season. The best and favourite variety was Norma,

gold, and the gardener who could bring red, scented Roses into the market at Christmas time would be sure of a handsome profit, as he could name his own price for them. In January, when our home-grown red Roses first come in, a single-flower will sometimes fetch 3s. At Christmas time, when every one's purse is open, they would fetch still more. It is a curious thing that no gardeners profit by this fact. They say that it is impossible to force Roses into bloom by Christmas, but this, I think, cannot be

FIG. 12.—PLAN OF GARDEN AND GROUNDS, FOR A NEW RESIDENCE IN HERTFORDSHIRE, DESIGNED BY MR. T. BAINE. (SEE P. 76.)

would impede the ripening process. *J. J. Willis, Harpenden.*

BERLIN.

Your readers may be interested by an account of some of the plants and flowers used here for decorative purposes at the Christmas season. These most popular were Hyacinths, Lilies of the

which, in former years, did not flower until a week or so later. Lilies of the Valley were sold as early as December 15, and are now vended in the streets by the flowerwomen, who also offer Violets, Mignonette, and Roses from Italy. Besides the ordinary Tea Roses from the Riviera, we had also numerous buds from one of the Noisette group, which were much liked. This variety, so far as I was able to identify it, was Fellenberg, and there was also another rather pale kind, which perhaps was "Hermosa." Red Roses are worth their weight in

correct. Under proper treatment, and by using the right materials (the latter is most essential), it surely would be possible to do so. German gardeners force only Roses grafted on root-stocks (dwarfs). But experience has shown that Roses grafted on stems about 1 foot high (half-standards), can be forced more easily, earlier, and better, and that they produce better flowers. The difference in time would be about a fortnight. Half-standards such as these would bear flower, but better flowers, than the dwarfs, but that, I think, is no reason for using only

the latter method. It is a curious thing that, although German gardeners are aware of these facts, they do not obtain the proper materials. To return to Christmas horticulture. The last few years the flower-shops have displayed much coloured paper and ribbon. Of the paper they make pot-covers, which form an effective background to the flowers put into them. If the right colours are chosen, the effect is very artistic. Lilac and Camellias (especially the former) look well when thus arranged. Cut flowers are displayed in an infinite variety of ways, some of the effects obtained are worthy to be reproduced by the pencil of an artist; but to describe them in words is impossible. I can give you some little idea perhaps, by telling you that single flowers are frequently so arranged that each blossom is seen in its full beauty. Christmas has, indeed, been an unusually gay time this year. *From our Special Correspondent.*

ORCHID NOTES AND GLEANINGS.

VANDA AMESIANA, white form.

As novelties, most white-flowered Orchids are pleasing, and particularly when they are varieties of an admired species. In Vandas, we have not hitherto acquired a pure white one. I recollect well many years ago, in the company of the late Mr. J. Veitch, seeing the first flower of what was sent home as a white Vanda, flowering in the private Orchid-houses of the Chelsea firm, which was eventually called Denisoni, but the flower did not excite the admiration of either of us, because although it was of good size, it was more ochraceous than white, and age did not even correct the want of purity. Now, however, among Mr. Statter's plants at Stand Hall, a pure white form of *Amesiana*—as white as a tuberose, as remarkable in substance, and, moreover, of high decorative importance—has been found. Individually, a flower of *Vanda Amesiana* does not go for much, but when a scape with eighteen flowers is obtained, the full number of a well-grown spike of *V. suavis*, then there is something to admire. Doubtless others will crop up in collections, as it would be singular, indeed, if there was only one white *Amesiana* among the many Vandas that are imported. In so far as one plant and another is concerned, there is not much dissimilarity. The one we are about to speak of is a largish clump, with branches crowded together, with no appearance of one or other of the growths taking a lead. Altogether, however, it makes a handsome clump grown suspended from the roof in a Teak basket, alongside of the *Laelia Gouldiana*s, which we have already described. *J. A.*

VANDA AMESIANA, &c.

Not the least of the charms of this pretty winter flower is its tuberose fragrance, and a houseful of it in flower at Messrs. Hugh Low & Co.'s Nursery exhibits this characteristic well. The house of *Angraecum citratum* at the above nursery will soon be as beautiful a sight as the *Angraecum sesquipedale* is at present. The *Cattleya Trianae*s are also fast coming into bloom at Clapton. *J. O'B.*

PHALANOPSIS SANDERIANA VAR. PUNICATA.

This distinct form is now in flower in the large collection of *Phalanopsis* at Messrs. Hugh Low & Co., Clapton, Nursery. The flowers in form are typical of *P. Sanderiana*, but the sepals and petals are pink of a more lilac hue. The chief peculiarity is, that the lower half of the lower sepals is spotted much in the same way as in *P. Stuartiana*; and the front lobe of the labellum and the bases of the side-lobes are also prettily spotted with crimson. The plant is very distinct, its leaves being ascending and acuminate, much as in the large forms of *P. Esmeralda*, but they are silvery-grey, spotted with green, as in some other forms of *P. Sanderiana*. It is a natural hybrid probably of *P. Schilleriana*, and a form of *P. amabilis*, as indeed we may readily suppose the typical *P. Sanderiana* to be. *J. O'B.*

CATTLEYA PERCIVALIANA.

There are so many bad forms of this in gardens that the beauties of fine forms are the more valued. A magnificent variety is in flower in the collection of Edward Moon, Esq., at Cassiobridge, Watford. Its blooms are large and well formed, the sepals and petals rich bright rose. The finely expanded labellum has a narrow margin of lilac, then a broad area of violet-crimson, which passes into blood-red as it spreads over the orange colour of the throat. Its history is curious, Mr. Moon purchased a large mass of *C. Percivaliana* which, however, proved an indifferent form; the vendor, however, seeing a gap in the large mass had made it up with the plant under notice, thus giving gold as a make-weight with copper. *J. O'B.*

ORCHIDS IN BELGIUM.

In the collection of M. Jules Iye, of Ghent, one of our most successful Orchid-growers, a beautiful plant has just flowered of *Cypripedium orphanum* ×, which is one of the finest hybrids obtained by Messrs. Veitch. It will be figured in *Lindeno*. The same amateur has also in bud a magnificent specimen of the rare *Cypripedium macropterum* × raised by M. Seden. *Odontoglossum Pescatorei album* is still a very rare plant, and is also in bloom in the collection of the same Orchid grower. The flowers are most distinct, the sepals, petals, and lip are pure white, and very large and beautiful in form. At the top of the lip, just under the column, which is also pure white, there is a large spot of lovely bright yellow. In no part of this exquisite variety is there any trace of red or purple, which colours are found in all the *O. Pescatorei*; at least, on their sepals, at the top of the lip, in spots in the centre, or on the edge of the lip. M. Iye, when he saw this variety in bloom in the famous collection of Baron Schroder, was much struck with it, and did not rest until he also had obtained a specimen of it. He has discovered the treasure in the establishment of a horticulturist in the neighbourhood of Ghent.

In the establishment of M. Vervaeet et Cie, there have flowered in three successive years, and each season about the same time (the end of November or beginning of December), half a dozen plants of *Cattleya* imported four years ago from the neighbourhood of a village called Fussagasuga, near Bogota (Columbia). These *Cattleya*s are something like *Cattleya Trianae* of Ibague, only those from Fussagasuga, as comparisons made on three successive years with the old *Cattleya Trianae* have proved, have always the two petals rounded, and much wider; they are firmer in texture, and the lip is more coloured than in the *Cattleya* from Ibague or from Popayan. The petals are in shape like those of *Cattleya chococensis*, only instead of remaining half closed, as do those of the latter variety, they open more widely than those of any other *Cattleya*; they are very showy and thick in texture, the flowers last three or four weeks, and this, in the dull month of December, is a great advantage. Three of these plants were shown at a meeting of the "Orchidomane" in the beginning of December. *From our Special Correspondent.*

LAELIA CRAWSHAYANA (Reich. fil) AND L. GOULDIANA (Reich. fil).

In reference to Mr. Rolfe's letter at p. 42, January 11, 1890, I have also had a three-flowered spike from Mr. Statter of Stand Hall, Manchester, of his fine variety of *L. Gouldiana*. In comparing it with my *Laelia Crawshayana* (the original plant named by the late Professor Reichenbach), I find that they are amply distinct in that all important point, in the former, namely, the lip. *L. Gouldiana* has not the spoon-handled lip that *L. Crawshayana* has, but it has a lip of an *L. autumnalis* form slightly less rounded, and less deflexed at the apex. Those plants of *L. Gouldiana* that I have seen, are widely different from those of "ordinary *L. autumnalis*," being greener in the bulb and leaf, and longer in proportion to the diameter of the bulb. I cannot agree either with the late Professor Reichenbach that *L. Gouldiana* may be

a variety of *L. Crawshayana*, as the latter's lip has lost the form of the former entirely; and a "variety" pure and simple can hardly lose the form of that all important segment. Neither can I agree to Mr. Rolfe's "conclusion" that it is a natural hybrid between *L. autumnalis* and *L. anceps*, because the "pencil on the lip" is identical in my *L. Crawshayana*, Mr. Statter's *L. Gouldiana* and also in *L. albidia*; but in *L. anceps* the "pencil" is quite different as to its arrangement, it being in larger lines and fewer too.

Mr. B. S. Williams has not a drawing of the "original" as no Orchidist has ever seen a drawing of my flower, for I have not shown the only drawing of a single flower that I possess to any Orchidist. I fancy the drawing referred to was of a plant that Mr. Adams bloomed, but having never seen this, I cannot say if it is really *L. Crawshayana*, and of the fact that many people are yet undecided as to it, there is ample evidence, for even Mr. Rolfe has apparently not seen an "original" flower, although when he wrote last January he thought he had the "real thing." Were I to surmise any parents for *L. Gouldiana*, I should say it was result of *L. autumnalis* attribens being crossed by *L. Crawshayana*. The powerful nature of the former has altered the natural hybrid's lip back to almost its original form as seen in *L. albidia*. The short spikes betray no evidence of *L. anceps*.

In the same mass of plants, from which came the two plants of *Laelia Crawshayana* which I bloomed, I also bloomed *L. albidia Stobartiana*, a broader variety than the common *L. albidia*. They were all three seedlings of about the same age, and, in my opinion, are quite likely to have dropped from the same fruit. I hardly think it admissible for Mr. Rolfe to name the plant he has before received *L. leucoptera* ×, till he has seen Reichenbach's named *L. C. leucoptera*, or we shall be in a far worse mess as to origin than we are now. Such naming and altering is only confusing in such rare things, that possibly, on the other hand, it is not of general interest, as so few have *L. Crawshayana*, and its variety *leucoptera*; therefore, the remainder of Orchidists unconcerned in the matter may term it "a storm in the coffee-cup," but it will form a bad precedent.

By the time this is in print, I hope the original will have been seen at the Royal Horticultural Society, and been identified by all who care about these slightly advanced forms of indistinctness, and yet distinctness. *De B. Crawshay, January 12.*

THE HARDY FRUIT GARDEN.

We have entered on a new year, and a few weeks hence the buds will be swelling on many of the earliest fruit trees, and planting and pruning are the most important operations during the present month. Autumn planting is always preferable, but not always possible, by reason of pressure of other work that will not be delayed. Those who are still behindhand with this kind of work should try their utmost to forward it during January, putting off nothing till the morrow. The first thing to be considered in planting trees is the due preparation of the ground, bearing in mind that if the ground is not put into good condition by stirring it to a good depth, it is a waste of time and money to plant trees; and where the ground is heavy and unduly full of moisture, measures should be taken to drain it thoroughly, the drains being put in not more than 3 feet deep; and, if brick rubble in quantity is at command, a thick layer over the pipes adds greatly to the efficacy of the drains; failing this kind of material, the common Heather is a good substitute for it, and lasts for many years. Where soils are light and shallow, it will generally be found that draining is not required. The borders for fruits should be made of good depth, and the soil well rammed to make it firm, and the benefits derived from using old lime rubble and soft brickbats cannot be too often impressed on young men in the making of all fruit borders, and whether the soil is heavy or

light, the former will help to aerate and sweeten after all the fibre in the loam is decayed, and long before the roots have taken possession of the whole border; and the latter may be made very firm by treading or beating, which will help to bring the material into a properly consolidated condition, and the rubble will prevent injurious consolidation of the new soil. In making borders always allow from 6 to 9 inches of soil above the future surface-level to allow for the sinking of the border, and when this is overlooked, the trees have to be earthed up—a fruitful cause of disease.

Apricots.—The earliest tree we have to deal with in this season is the Apricot, and it is one that well repays proper attention. When Apricot trees have stood undisturbed for a number of years, and the roots have gone deeply into the subsoil, that is dry, mildew becomes troublesome, many of the flower-buds drop immediately they begin to swell, and those that are left do not set kindly. It is usual to apply sulphur, which somewhat checks the mildew, but the crop is either a partial one or a total failure. Copious watering will sometimes prevent this kind of loss. If the pruning and tying or nailing of Apricot trees is finished, a mulching should be applied to all the healthy trees, and the hose turned on, so as to give the border a thorough soaking.

Plums, Cherries, and Pears which have been pruned, tied, or nailed in, should be well washed with a cheap insecticide, and it is best followed by a strong shower from the garden-engine, only good will be done. Green and blackly were unusually troublesome last season, and many trees were seriously injured by the consequent loss of foliage and young wood. In cold gardens, where dessert Cherries are subject to gumming, many of the varieties succeed better under the extension method of training, which involves the annual laying in of a quantity of young growths from the base of the bearing shoots; and by training the main branches widely apart, and practising summer pinching of shoots not needed for development, the trees soon become thickly studded with spurs, and very little pruning is required in winter. *A. Rivers, Lythe Hill, Hove, Sussex.*

THE ORCHID HOUSES.

POTTING, &c.—No delay should take place in the repotting, re-basketting, and surface-dressing of all sorts of Orchids. And where a large number of plants are grown, it will tax the grower's abilities to get this all done, as I consider it should be, by the first day of May. Peat, potsherds, and "where possible" new pots should have been prepared, good fresh sphagnum moss picked over and if it is in lumps, carefully looked over without pulling it to pieces, as it then is very much better to handle when using it. Those plants which should be first done, I will show in their proper section.

East Indian House.—All the plants of *Cypripedium labatum* section, which have not been reported during the past year, should be at once examined; and as it would take up too much space to enumerate each variety, I will mention *Laurenceanum*, *Morganii*, *axillatum*, *enyanthum*, *chilense*, &c. For potting, peat and sphagnum moss are the only materials that are required to grow them to perfection. Then should come nearly all the different varieties of *Aerides*, as *Sanderianum*, *Lawrenceanum*, *Godfreyi*, *odoratum*, and its varieties, which should all be turned out of their pots it seeming to require it; and plants which have lost their lower leaves should be cut down; a few of the roots should be placed inside the pot, and the potsherds carefully placed in afterwards. It is not good practice to cover up too many of the roots of *Aerides*, and if it be done the plants will in most cases suffer. Many of the *Saccolabium*s, *S. Blunoi majus*, *curvifolium*, *celestis*, *guttatum*, and its varieties, are now ready to be repotted. The *Phalaenopsis* now flowering must not be allowed to suffer from want of water, as no plants are more affected by flowing than these; if allowed to get dry; too much moisture in the air of the house being carefully guarded against. In our houses we give one good drenching with the syringe in the morning, and water the floors at night, but no had and not too fine may be had down in this matter, there being hardly two houses whose conditions are just equal. Such plants as *Cattleya Dowiana*, *C. aur-a*, *C. Hardyana*, which are resting in this house must not be allowed to get too dry, and it should be remembered that to let

these plants shrivel is injurious, and a serious loss of strength. Temperature, 65° at night, 70° by day.

Cattleya-house.—In this house we are beginning to look gay with flowers of *Cattleya Trianae*, and with those of the new white varieties of *Lelia anceps*; one plant of *L. Sanderiana* is now carrying over fifty flowers. I find that these plants like the highest possible place that can be given them in the Cattleya-house, and in our house they are hung up close to the glass, and supplied plentifully with water whilst growing. Hardly any *Cattleya* at present requires more water than is just sufficient to keep its pseudobulbs from shrivelling. *C. Percivaliana* now in flower is in colour a beautiful little *Cattleya*, but the pity is, it is too shy in flowering. In most cases only one flower comes on the fat pseudobulbs; it is rather disappointing. Plants of *Lelia autumnalis* and *L. Gouldiana*, which are past flowering should be kept dry, and placed as closely as possible to the light, and where a small amount of air is admitted, so that thorough ripening may accrue. Temperature 60° at night, 65° by day. *A. G. Catt, Parkfield, Hallow.*

FRUITS UNDER GLASS.

In writing my Calendarial notes, it is my intention to adhere strictly to the teachings of my own experience, being fully assured of their soundness, and I nurse the hope that my efforts will be received in as kindly a spirit as they are offered.

Pines.—These plants should be kept quiet, and in a state of semi-rest all round, until the middle of the month of February, unless there are a few advanced fruits which are wanted for particular purposes; if so, it would be wise to get these put together, plunging them rather deeply into the hotbed materials, and at the warmer part of the house. Meanwhile, take care of all well-rooted, healthy stools, as the pipe trim is cut, and, if possible, give them a frame or put to themselves. Aim at keeping a penial temperature of about 60°, where they will lay the foundations for strong plants, by developing slowly and sturdily suckers, which alone produce those large luscious fruit, so much desired. The more slowly these stools grow in the winter, the more sturdy will be the suckers; once become drawn, they never make fine fruits, and which is often the case with those grown on the plant during its fruiting stage, hence my preference for suckers grown on the old stools. Much of the secret of success lies in the sturdy development of the plant; given such, any tyro can grow good Pines. We always allow the suckers to become of a large size before detaching them from the parent plant. These are potted into 8 inch pots, and grown on the one-shift system, and February and August are the best months to put in suckers, but some are put in at other dates intermediate to these. *Smooth Cayenne*, *Moscow Queen*, and *Charlotte Rothschild*, are our favourites, but to those who enjoy a sweet, luscious Pine, I can commend *Lord Curzon*.

Use every means to husband fire heat, highly heated pipes being a great evil; and endeavour to avoid extremes, the effect of cold being quite as injurious. Hard and fast temperatures cannot always be followed safely, and even a stoker is expected to use some amount of common sense in his duties. At this time of year, the atmosphere is frequently at saturation point, and little syringing is requisite, but the floors, walls and surface of the beds should be once, twice or more, damped according to the heat maintained in the pipes. I have condemned evaporating troughs and steaming pans long ago, these are as obsolete as the three years' fruiting system. Fruit may be grown in half that time of from 5 to 10 lbs. in weight, and of the best quality. Watering the Pine plant, at this time of year requires much judgment, and in doing so, the surroundings and the position of the respective plants must be observed; for those at the outside of the beds being usually nearer to the hot-water pipes lose moisture faster, and necessarily a larger supply of tepid water is needed by these.

The Early Vineery.—This house, if it was closed in November, will now have bunches on the point of flowering, and the vines will need much attention to build up the substance of the leaves. Maintain a gentle circulation of fresh air, free from draughts, and passed over the pipes if that be possible, and endeavour to do most of the forcing by daylight, withdrawing much of the heat in the pipes at night,

55° to 60°, more or less, will do no hurt according to the temperature outside. Stop the laterals at one, two or more leaves beyond the bunch, the number being decided by the space at command for the proper development of the foliage; disbud and rub off all superfluous shoots, and allow a moderate quantity of healthy robust shoots and leaves, which are better than a greater number more crowded. Beware of a close steamy atmosphere, which may make the foliage pleasanter to look upon for a time, but is certain to cause it to suffer when the dry north-easterly of March come with bright sun. This tender foliage is then sure to "burn" and flag severely, no matter how good the ventilation may then be. I find that the *Madresfield Court* Grape stands forcing nearly or quite as well as the *Black Hamburgh*, and taking just about the same time. It is in my opinion always superior in quality to that variety, but it is always a good plan to grow a few *Black Hamburghs* in the same house as *Madresfield Court*; the pollen of the former vine being more abundant than the latter, and consequently useful to impregnate the *Madresfield* with.

Scamperiis.—The earliest plants are now in flower, or on the point of flowering, and the camel-hair brush should be used on the blooms, a nice buoyant atmosphere being maintained. Strive to force the plants by daylight, although that be but a little. Keep a general warmth in the pipes by abundant ventilation, free from draught, and if the plants are kept near the glass they will not become drawn, or liable to attacks from insects. Rest the plants somewhat at night-time, by partly shutting off the heat, and reduce the ventilation. Daring frosty weather the above directions should be modified. The favourite variety here at present is *La Grosse Hélicé*, I having reluctantly given up *Vicomtesse Sarracé* de Thury in its favour. Introduce fresh batches to the houses according to the requirements of the family. Maintain a temperature of 45° by night, and 55° a little more or less, by day. *W. Crisp, Madresfield Court.*

THE KITCHEN GARDEN.

SEEDS, &c.—In the new catalogues which have come to hand, are many novelties; but before attempting to grow any of them largely, it would be well to try them, whilst beginners will do well to keep closely to the known and long-tested varieties for the main crops. The stock of seeds left from last year should be tested in mild heat, and the fresh also, before sowing any of them outside. If fifty or one hundred seeds be placed in small pots, and well looked to as regards watering, the germinating percentage will readily be observed, but this will be rather higher than will obtain out-of-doors. The proper varieties to grow will depend much on the quality and nature of the soil and the locality, and therefore a list of them given, will not be of much value.

Broccoli.—Vitch's 8-46-protecting will now have been consumed, and Snow's Winter White Broccoli being the next to become fit for use, the stock should be frequently examined, and any heads that are formed should be lifted carefully, and heeled in in frames or on a sheltered border, so that some kind of protection may be afforded them in frosty weather.

Tomatoes.—Plants to fruit early should have been raised in the early part of November, and should be in 60's by this time. If these are well rooted, they may be shifted into 32's, giving them a thorough watering before repotting them. The best kind of compost to employ is a moderately light fibrous loam, with sweet and rough leaf-mould, or spent Mushroom manure, not in too wet a state, and free of worms. Drain the pots moderately well, and press the new soil firmly about the roots; fasten the stem loosely to a stick, and place them where they may enjoy full sunlight, no water being afforded them for some time, and when the plants have recovered from the root disturbance, pinch out all side shoots. Maintain a temperature of 55° by night, with a rise of 10° or less by day, according as the weather is mild or otherwise. Plants for succession should be rooted as the supply may demand. Sow thinly in pans or pots in light sandy soil made firm, and give no water for a few days, unless the soil should get very dry. Place a sheet of glass or tile over the pans, and plunge them near to the pipes. *H. Markham, Mereworth Castle, Maidstone.*

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of to all events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be written on ONE SIDE ONLY OF THE PAPER, and sent as early in the week as possible.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

		SALES.
MONDAY,	JAN. 20	Dutch Bulbs and Lilies, at Protheroe & Morris' Rooms.
		Roses, Fruit Trees, Shrubs, Border Plants, Bulbs, &c., at Stevens' Rooms.
WEDNESDAY,	JAN. 22	Lilium auratum, Greenhouse Plants, &c., at Protheroe & Morris' Rooms.
		20,000 Lilium auratum, and others, from Japan, at Stevens' Rooms.
THURSDAY,	JAN. 23	Nursery Stock, from Sample, at Protheroe & Morris' Rooms.
FRIDAY,	JAN. 24	Imported and Established Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	JAN. 25	Roses, Fruit Trees, Shrubs, Border Plants, Bulbs, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—37°.8.

The work of the year began on Tuesday last in the Drill Hall, where, after Sir TREVOR LAWRENCE, the President, had welcomed the new committees, and thanked the old ones, the work began in earnest. The exhibits were naturally not very numerous, but, as usual, they were interesting, the beautiful series of Pitchers (*Nepenthes*) exhibited by Messrs. VETCH particularly so. The members of the several committees mustered in good force, the Orchid Committee, if we mistake not, being more numerously attended than usual, and certainly affording some ground for the complaint that the Floral Committee is proportionately weakened, some of the "all-round men" being drafted off on to the Orchid Committee.

We can see no special reason why the Orchid Committee should not sit after the meeting of the general committees, and thus practically revert to an old practice which worked well, and in which, after the transaction of the general business, the Chairman of the Floral requested certain members to deal with specialities, whether they were Orchids, or florists' flowers, or what not. But if a special amount of autonomy be demanded nowadays by the Orchidists, there is no reason why they should not have it, without in any way interfering with the composition of the other committees. There is still, even under the new arrangements, whereby the principal committees sit at noon instead of at 11 A.M., an awkward pause between the close of the com-

mittee work and the afternoon meeting at 3—a pause longer than is required for the exigencies of luncheon.

The first afternoon meeting of the year was fairly attended, and, all things considered, even more numerous than could be expected. The lecture was bright, genial, well-delivered, and practical. The Rev. Mr. WILKS, the energetic and admirable Secretary, did well to call attention to the deplorable condition of many gardens during the winter season. Of course, he had not in view the larger gardens attached to country mansions, where neither space nor cost are primary considerations. He was dealing rather with the smaller gardens, which form the great majority, whether in the vicinity of our towns or in the country. Naturally, he based his observations on his own garden, which he aptly described as a garden of borders—borders, we may add, filled with a most varied assortment of beautiful and interesting hardy plants, surrounding a wide lawn dotted with striking specimen plants, and the whole surrounded by a thick shrubbery with lofty trees interspersed. The ordinary herbaceous border, when cleared for winter, presents too generally a monotonous appearance of bare-ground, dotted with tufts of dead leaves and stumps of plants, once beautiful and variegated, with labels which show of what has been, and, with less certainty, of what may be expected in future. Deciduous trees and bushes are not without their beauty in winter, the bark, the buds, the spray, all contain elements of beauty for those who look for it; and, as for colour, what more glowing than the red bark of some of the Cornels and the clear yellow of some of the Willows? Mr. WILKS even finds beauty in the rugged, gnarled boughs of an old Apple tree. To relieve the desolate appearance of bare borders, the lecturer recommended the plan of growing evergreen shrubs in small pots, and sinking them in the borders between the herbaceous plants. For those to whom expense is an object, small stuff may be employed, or seedlings or cuttings may be grown on, for the purpose, thus affording the gardener the pleasure of seeing the plants gradually increase in size and beauty. *Retinosporas* were recommended for the purpose, as well as *Hollies* of all kinds, *Aucubas*, *Mahonia*, *Euonymus radicans* and *E. japonicus*, the variegated forms of *Elwagnus*, *Cupressus Lawsoniana* in all its forms, *Gaultheria shallon*, *Laurel*, *Cherries*, *Portugal Laurels*, *Cotoneasters*, *Sea Buckthorn*, *Furze*, single and double *Helianthemums*, *Daphnes*, and *Ivies*. Mediterranean Heaths in the foreground had the advantage of flowering in the dull season along with the *Hellebores*.

It is obvious from this list that great variety of size, form, and colour may be gained at little cost, and no more trouble than is necessitated by the pleasant task of assorting the plants according to position, size, colour, and other circumstances.

The routine followed is to place the plants as procured in September or October in as small pots as possible, and to plunge them in the borders according to their size and other circumstances. About the middle or end of April the plants are removed from the borders and taken to the potting-shed, where they are repotted in pots of about the same size, making use, for the purpose, of the compost, which has been applied to the fruit trees in the orchard-house, the nutritive qualities of which are by no means exhausted. When repotted, the plants are placed out in a shady spot, and kept watered till the end of September, when they are again plunged. On this we should remark, that even better results

would be obtained by plunging the pots in a north border. We have ourselves obtained good results by knocking the plants out of the pots in spring, and "laying them in" a shady place, removing them into pots in the autumn, and dotting them between clumps of *Snowdrops* and *Crocuses*.

Into the details of propagation we need not here enter; it must suffice to say, Mr. WILKS abundantly proved how attractive a garden may be made, at little cost, in the dull months by the adoption of procedures such as he recommended.

THE LATE CHRYSANTHEMUM SHOW AT EDINBURGH.—At the meeting of the Scottish Horticultural Association, held on the 7th inst., the Treasurer, Mr. A. MACKENZIE read a statement of the income and expenditure of the International Chrysanthemum Centenary Exhibition, held on the 21st, 22nd, and 23rd November last, as up to the date 28th December, 1889, the income reached the total of £1389 11s. 0d., and the expenditure £958 6s. 5d., leaving a balance of £440 5s. 4d. As showing the popular interest taken in the event, it was stated that during the three days of the show over 40,000 people entered by the turnstiles, which are checked and recorded by the City authorities. On the motion of Mr. MATTHEW DENNIE, it was resolved to contribute £20 of the surplus to the general funds of the Association, £5 to the benevolent fund of the Association, £5 to the Royal Infirmary, Edinburgh, and £5 to the Gardeners' Orphan Fund. An honorarium was also presented to Messrs. MERRIO and FERGUSON, the joint honorary secretaries, who by their energetic and intelligent management did so much to render the show a success. Mr. D. P. LAIRD moved, and Mr. RUSHTON seconded, that the Association should hold another Chrysanthemum Show on similar lines to the last, and the motion was all but unanimously carried, and a committee appointed to draw up a schedule immediately.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The quarterly meeting of the above Society was held on Monday evening at the Caledonian Hotel, Mr. RILEY SCOTT in the chair, and on this occasion four new members were elected, making the total for the past year forty-two. The annual meeting has been arranged to take place on Monday evening, February 10, at the above-named hotel. The secretary, Mr. W. COLLINS, of 4, Martindale Road, Balham, S.W., will be happy to answer any inquiries respecting the above useful Society.

PROFESSOR LAWSON.—Notification has appeared in the *London Gazette* of HER MAJESTY'S approval of the appointment of Professor LAWSON as Argentine Consul at Halifax, Nova Scotia.

"L'ORCHIDÉENNE."—At the meeting held at Brussels on the 12th inst., a Diploma of Honour of the first class was awarded to M. Linden, for *Acridis augustianum*, a new species from the Philippines. First-class Certificates were awarded to *Odontoglossum Rossi* var. shown by Madame Gibeze; to an unnamed *Odontoglossum* shown by M. Hye-Leyssen; to *O. Pescatorei* album, from M. Hye-Leyssen; to *Cypripedium Arthurianum* from M. Wallaert. Second-class Certificates were given to *Odontoglossum Cervantesii* var. *illicium*, from M. Warocqué; to *Oncidium splendidum*, from Mr. Van Imeschot; to *Cypripedium nitens*, from M. Linden; and to *Cattleya Trianae*, shown by M. Linden, as well as by M. Vervae. A Cultural Certificate of the first class was awarded to M. Linden, for *Mastdevallia Macnura*; to Madame Block, for *Cypripedium caudatum*. A Cultural Certificate of the second class was awarded to M. Warocqué, for a variety of *Odontoglossum crispum*.

THE FIRST SNOWDROP.—On the 9th of the present month we had the delight of gathering the first *Snowdrops* of the year, and these from a cold,

FIG. 13.—*Solanum macranthum*—THE TREE POTATO. FLOWERS DEEP BLUE. (SEE P. 75.)

clayey, damp garden, with a northern aspect, and one in which, as a rule, all spring flowers are late in making their appearance. From the state of expansion of the flowers, when first seen on the 9th, it was obvious that they must have been in bloom on the 8th at least. Thinking the date unusually early, we turned to the records at our disposition, with this result: The earliest date recorded, so far as we know, and during a period of fifty-five years, is December 21, 1778. This was recorded by Mr. MARKUM, in a paper read before the Royal Society on April 2, 1789, extracts from which were reprinted in our columns in April 7, 1888. Setting this on one side as quite exceptional, and as applying to a special variety, such as that known as obtusifolia, we turned to *White's Sebourne*, wherein we find that on the average of twenty-five years the earliest date (in Hampshire) noted was January 10, the latest, February 5. MARKUM's observations, for the period, noted in the same book, and made in Sussex, show January 18 as the earliest. The *Cobham Records*, edited by Miss OMERON, cite January 10 in 1834 as the earliest day, and February 27 in 1838 as the latest, the mean date being February 2—"an amplitude" of forty-six days. At Marlboro' (Wiltshire) as recorded by Mr. ROBERTS, in his *Naturalist's Diary*, the earliest date is noted as January 11, the average being the 28th, the latest February 16. The mean of fifty-five annual observations in Norfolk give January 15 as the average date of the first appearance of the Snowdrop; while in Surrey, the mean of twenty annual observations give February 2 as the average date. According to Mr. PNESTON, who has tabulated the results, during ten years of observations made at fifty different places in the British Isles, the average date of flowering is on January 27. The earliest noted was on January 14 in 1875; the latest on the forty-sixth day of the year (*i.e.*, February 15) in 1880. This latter date is noteworthy. Those who remember the dreadful season of 1879, when rain was almost continuous, and the sun well-nigh banished from these Isles, a state of things followed by a severe winter, will not be surprised to hear that not only the Snowdrop, but other flowers were behindhand in 1880. Thus the Hazel was not noticed till the fifty-seventh day, instead of the twenty-ninth; the Celandine (*Ficaria*) till the sixty-fourth day, instead of the forty-ninth, and so with others. The year 1881 was also a very backward one, owing, no doubt, to the severity of the previous winter. Unfortunately, in these cases there is in general no corresponding record of soil temperature, a most important factor in these cases. Taking the whole of the recorded observations, it appears that the average of the earliest dates of flowering of the Snowdrop for the whole country is the 11th of January, the average of the latest observed first flowering is the forty-ninth day of the year (February 18), the mean between the two extremes being thus the 30th of January. If the average obtained by dividing the sum-total of the observations by their number be taken, the result arrived at is the 28th. So that on the whole it may safely be assumed that the first flowering of the Snowdrop may on the average of the whole country be expected between the 28th and 30th, being earlier or later according to season and locality. Unfortunately in these calculations not only is any reference to soil temperature wanting, but also all consideration of the particular variety of Snowdrop. This is scarcely ever recorded (never so far as we have seen), and yet, as connoisseurs know, there is a very wide range in this particular in the same season, and in the same garden, according to the variety.

M. COSSON.—The death of this eminent systematic botanist is announced. M. Cosson had a fine library and museum, and for some years past had been collecting materials for a Flora of the Barbary States.

A LAW TO PROTECT GENTIAN.—The Gentian, whose roots, not alone of use in medicine, but also in the fabrication of a kind of spirit much patronised

by the natives of the mountain regions where the plant is found, is in danger of being extirpated by the practice of digging out its roots before the seed time. The *Salzburg Landtag*, with the view of preventing the entire loss of this plant, has passed a law which forbids the digging up of the roots when they are of less diameter than 2 centimetres. As this diameter is attained only by a three-year-old plant, two seasons of seeding are secured. *Gentiana and Bluegiantwort, Dorothea*, 1889.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The following is a statement of the receipts and payments for the year ending December 31, 1889, presented to the annual meeting on the 16th:—

Approved, January 13, 1890. J. E. MURPHY, J. J. WILKINSON, J. J. WILKINSON.

At the election held on Thursday last the following candidates were placed on the list of pensioners:—James Bailie, Sophia Burt, Mary A. Milroy, Elizabeth Parker, Sarah Bensch, Robert Cox, Geo. W. Young, Maria Milley, and James Robinson.

THE ROYAL HORTICULTURAL SOCIETY AND THE NATIONAL ROSE SOCIETY.—We are glad to be able to announce that the following prizes for Tea and Moss Roses are offered for competition by members of the National Rose Society at the meeting of the Royal Horticultural Society to be held on June 24 next:—

Class 5. For amateurs only, six varieties Tea and Noisette Roses, three blooms of each, £2, £1, and 10s. First and 2nd prizes by Mr. F. Cant; 3rd, by Mr. G. Prince.

Class 6. For nurserymen only, twenty-four varieties of Teas and Noisettes (distinct), £2 10s., £1 10s., and £1. Offered by Dr. Hogg.

Class 7. Twelve varieties of Teas and Noisettes (distinct), three blooms of each, £2 10s., £1 10s., and £1. Offered by W. H. Fowler, Esq.

Class 8. Open. Twelve varieties of Moss Roses, in bunches, £1 10s. and £1. Offered by Messrs. G. Bonyard, of Maidstone, and Messrs. Cooling, of Bath.

Class 9. Open. A basket of Tea and Noisette

Roses, in tripod wicker baskets, as at the National Rose Society's shows; Rose foliage only to be used. Offered by Messrs. Paul & Son.

Such co-operation to a common end is most valuable, particularly when in this case two distinct principles are represented—the competitive and the educational, both of which are necessary to the end in view. In this way great part of the work of the special societies could be done at less cost, and with less unnecessary frittering away of energy than under the existing circumstances, and without any weakening of the parent Society.

STOCK-TAKING: DECEMBER, 1889.—A great change has come over the face of affairs since our last note on stock-taking. The joys of the Christmas season are replaced by the woe and the sneeze of the so-called influenza patient; but even in these returns we can find hope for the thousands of sufferers! There appeared in the public press a few days since a paragraph to the effect that in certain parts of southern Africa this so-called influenza was a common disorder amongst the native population, who on being attacked ran, not for the hospital, but for the orange-groves (the fruit being always ripe at such times), and sucked the healing juice until such time as they could contain no more, when the evil spirit had departed. So for Londoners it will be glad news that there is a grand importation of oranges and lemons. The importation of these two beautiful fruits during the month just past amounted to 1,354,712 bushels. So now—bearing "Southern Africa" and its natives in mind—may fruits and disease disappear together! There are a few other imports to note, however, as coming from foreign countries and British possessions, which we give in the usual tabular form as follows:—

	1888.	1889.	Difference.
	£	£	£
Total value of imports	37,949,625	38,297,931	+347,306
{I.—(A.) Articles of food and drink—duty free	12,457,038	11,769,094	-687,944
{B.)—do., dutiable	2,100,965	2,267,836	+166,871
{VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)	10,200,878	10,232,520	+31,642
{VII.—Raw materials for sundry industries and manufactures (including wood and timber, brown, sawn, split, dressed; vegetable materials, for paper-making, &c.)	2,741,092	3,029,375	+288,283
{IX.—Miscellaneous articles (including Clover, Grass, Flax, Rapes, Linseed)	1,685,265	1,657,703	-27,562

The following excerpts have the usual interest:—

	1888.	1889.	Difference.
	£	£	£
{II. Fruit—			
Apples, raw	—	57,509	436,629
Unenumerated, raw	—	16,282	15,069
Onions	—	355,633	324,600
Potatoes	—	108,610	18,311
Vegetables, raw, unenumerated	—	—	—
ated	—	Value £13,200	£29,835
			-13,364

Once more the British market gardener will note that "minus has it." It would be interesting to note under existing conditions of health, if there is any increase in the imports of Cichouca, but the figures are not given, further than that there is an increase of £3000 in the value of "unenumerated drugs."

ROSE STATISTICS.

(Continued from p. 57.)

THE BEST TWELVE TEAS FOR SHOW.

Here, as with the H.P.s, some varieties that are comparatively new or little known, *e.g.*, Madame Hoste, Ethel Brownlow, &c., are probably deserving

of a somewhat higher rank than they here obtain; but this, time and trial can alone decide.

LIST V.

The Best Twelve Teas for Show Blooms. (45 Votes.)

Table with 3 columns: Name, Votes, Name, Votes. Lists names like Catherine Mermet, Comtesse de Nadallia, etc., with their respective vote counts.

THE NEW BEST TWELVE TEAS.

Of these I have only given those obtaining five or more votes, there being fifty-three others named. Again, it is obvious that the higher ones in List V, will figure among the lower in the present list, as they have already received almost as many votes as possible.

LIST VI.

The Best Twelve Teas for Show (44 Votes.)

Table with 3 columns: Name, Votes, Name, Votes. Lists names like Robeus, Princess of Wales, etc., with their respective vote counts.

LIST VII.

Extending Twenty-four Votes. An Extra List, and All are included.

This list practically gives the best twenty-four Teas, in the opinion of the voters, for show purposes.

Table with 3 columns: Name, Votes, Name, Votes. Lists names like Catherine Mermet, Mme. Laroche, etc., with their respective vote counts.

The next few columns in the Statistical Returns have received so few answers that those who may happen to be interested in the subjects which they concern will not find it any great labour to summarise them for themselves.

THE TWELVE HARDEST TEAS.

Those receiving less than five votes have been omitted, as they included the name of almost every known Tea.

LIST VIII. The Twelve Hardest Teas. (33 Voters.)

Table with 3 columns: Name, Votes, Name, Votes. Lists names like Mme. Lambarde, Marie Van Houtte, etc., with their respective vote counts.

ANY EXCEPTIONALLY DELICATE TEAS.

In this list it must be remembered, in contradistinction to all others, that the greatest honour is to be at the bottom and not at the top.

LIST IX.

Extending Twenty-four Votes. An Extra List, and All are included.

Table with 3 columns: Name, Votes, Name, Votes. Lists names like Comtesse de Nadallia, Jean Dupont, etc., with their respective vote counts.

The preceding list would have been of more general use to the inexperienced if the question asked had referred to "hardiness to withstand frost." As it is, it appears to be evident that some, in making this return, have regarded "weakly growing" as synonymous with "exceptionally delicate" — i.e., Madame Cusin is undoubtedly a somewhat poor grower, but it is very hardy against cold, whereas those marked with an asterisk (*) are among the easiest victims to King Frost.

I trust, therefore, that those who have been kind enough to vote on this question of delicacy will not be offended by my expressing a hope that the general public, for whom our labouring to make these notes will not give undue weight to the verdict of this or the following list, but will try for themselves; and in particular that they will let nothing deter them from planting that perhaps most lovely of all lovely Teas, Comtesse de Nadallia, which in my own garden, for instance, proves as hardy as any, though not quite so vigorous a grower as some. It may further be pointed out that any not named in either List VIII, or IX, are neither especially hardy nor particularly delicate. However, to reap the true value of Lists VIII, and IX, it remains to combine them, or rather to subtract IX, from VIII, and note the result. R. B. Wicks, in Journal of Royal Horticultural Soc., (p. 127, 1889.)

RAILWAY RATES.

TERMINALS.—The railway rates enquiry is now approaching a stage of great importance to the horticultural trades. We understand that a meeting of these trades has been called by the Nursery and Seed Trade Association for Monday next, at the "Windsor Hotel," Victoria Street, Westminster, at which meeting a report will be given on the present position of the enquiry, and steps taken with a view to deciding the class of evidence to be laid before the tribunal charged with the enquiry. The position of the matter to-day is somewhat improved compared with the state of things in existence at the time of the opening of the enquiry. Already certain articles have been moved to lower classes, concessions have been made (as we recently pointed out) with regard to "smalls," and a new class for "perishable merchandise" has been created. There remains

to be considered the classification of articles not yet agreed upon, and also the question of rates for conveyance, and for station and terminal services. We propose this week to call our readers' attention to the subject of "Terminals," which is undoubtedly the most difficult of the questions to be decided; but before we do so, we would wish to correct a wrong impression which exists, we believe, in the minds of many who have but cursorily studied the matter, viz., that the traders of the country are endeavouring to reduce the rates charged by the railway companies—such is not really the case. If this were effected, and the revenues of the companies were materially reduced, the traders would very soon find out that the remarkable facilities enjoyed by them at the present day would be also reduced. The interests of the railway companies and of the traders of the country are undoubtedly closely allied up to a certain point, but care must be taken that the advantages of the one are not extended to the detriment of the other, and this is what the traders are contending so vigorously against. It is, as far as they are concerned, a war of defence and not of aggression.

Amongst other things, the companies are endeavouring to have fixed, certain maximum terminal charges for (1) station accommodation for goods, and (2) services rendered in handling goods. Terminal charges have always existed in some shape, and indeed, have been recognised by the Law Courts—notably in the case of Hull & Co. the London, Brighton and South Coast Railway, in which the right to make a terminal charge was fully discussed and decided upon, by the Queen's Bench—but they have hitherto been under the jurisdiction of the railway commissioners. Since the passing of the Railway and Canal Traffic Act, 1888, the railway commissioners have ceased to exist, and there will now be no means of appealing to any tribunal to settle any differences which may arise with regard to terminal charges. Hence the necessity for fixing maximum terminal charges which shall be fair and reasonable, and at the same time binding alike on the railway companies and traders; and on the principle that a bad law is better than an uncertain one, it will be for the benefit of all that this should be done.

But how is the terminal charge to be arrived at, and of what is it to consist?

The railway companies are seeking to divide it as above-mentioned, but their right to make a charge under the second head is being strenuously opposed on the ground, that the charges for handling the goods are included in the rates for conveyance. It is different with regard to station terminals or charges for accommodation at stations for goods in transit. This charge represents that which was formerly made by the carrier before the development of railway goods traffic, at which period the carrier undertook the collection and delivery of goods, and supplied accommodation for storage. When, as pointed out in a previous number, the railway companies took over the businesses of the great carriers, they erected goods stations and sheds in close proximity to their lines, and they have hitherto charged traders with a sum representing a fair percentage on the capital provided for the erection of such buildings. Consequently, there has been no uniform charge made for station terminals, the amount being determined by the circumstances in connection with each station, and it follows that the cost of providing accommodation at a small country station would be much less than at stations such as Manchester, Liverpool, or Birmingham.

But the railway companies have arrived at a very simple method of fixing a maximum station terminal. They propose to lump the whole cost of constructing accommodation for goods throughout the kingdom, and strike an average. If this plan be adopted, the small tradesman at an out-of-the-way station will be called upon to pay his share of the cost for accommodation and maintenance of warehouses, &c., at all the centres of commerce. The companies profess to be unable to adopt any other means of arriving at a proper charge, but it is diffi-

cult to see why the principle hitherto adopted cannot be continued. It must be borne in mind that the tonnage passing through large towns is very great; and, even admitting the increased cost for accommodation, yet the rateable charge per ton would be decreased in proportion to the increase of traffic. The task of inquiring into the costs of construction of all the goods' stations in the kingdom is one at which Lord Balfour of Burleigh might well stare agast, but that would appear to be the only satisfactory way of arriving at the data on which to base the terminal charge.

With a view to avoid such an enormous expenditure of time and money, it was suggested by the Board of Trade that they should appoint a Commissioner to inquire into, and report upon, the cost of construction of each station, and that this should be done concurrently with the holding of the inquiry; but the Lord Mayor's Committee of Objectors appear to have considered that such an inquiry (at which the objectors would not be represented) would prove most unsatisfactory. It was therefore arranged for the present, at all events, that the railway companies should select a certain number of representative stations, and submit their accounts for construction of them for the examination of the objectors. One of such "representative" stations selected by the London and North Western Railway Company was Northampton Castle Station, and the engineer-in-chief of that line was called to prove the cost of construction, and from him was elicited by Mr. Balfour Browne, Q.C., on cross-examination, the fact that in the construction of such station the company spent £6000 in diverting the course of the River Nene, which originally ran across the site of the present goods station. If the "average terminal charge" is to be based on such expensive stations as this, it is feared that traders will be called upon to pay far more than their fair proportion. The objectors will naturally retaliate by selecting stations which have been erected at a minimum of cost, and the prospect of fixing a fair terminal charge will not be advanced.

The attempt to fix a proper terminal charge is not of recent origin. So far back as 1861 a long discussion took place between the Chairman of the railway committee of the House of Lords (Lord Redesdale) and the various railway companies with this object, and a model clause was accepted by the railway companies (but which was, unfortunately, never incorporated in any Act of Parliament), to the effect that the railway companies should make a reasonable terminal charge for the accommodation afforded and service rendered other than the actual charge for conveyance, such charge in no case to exceed 2s. per ton for goods, and 6d. per ton for minerals at each terminal station. The proposed terminal charge now reaches 5s. 6d. per ton, being 2s. per ton for station terminal and 3s. 6d. per ton for service terminal. If one terminal charge of 2s. per ton would have satisfied the railway companies thirty years ago, it is difficult to understand why to-day they require two charges, amounting to nearly three times as much. It is true that the accommodation provided to-day is greater than it was then, but so is the traffic, and it is only fair to assume that the accommodation has been increased only in the same proportion as the traffic has. If it has been increased beyond such proportion (as, indeed, is suggested) then the traders ought not to be called upon to pay for accommodation which is not required.

The charges included by the railway companies under the head of "service terminals," which they seek to impose, embrace a variety of items, amongst which are the following:—Wages paid to clerks, agents, shunters, weighers, marshmen, checkers, signalmen, signal lampmen, pointmen, porters, watchmen, gatemen, also charges for stationery, coal, clothing, and numerous other things; and for all these they seek to make a charge to the trader, in addition to the charges for station accommodation and for conveyance. The greatest possible resistance will, of course, be offered to this charge, and we hope it will not be without good result.

DARLINGTONIA CALIFORNICA.

We are now able to lay before our readers an illustration (fig. 15) of the fine specimen of this Pitcher-plant, to which reference was made in our last issue by Mr. Burbidge (see p. 50). The figure is from a photograph, and the plant grows in Mount Merrion Gardens near Dublin, the largest pitcher measuring 3 feet 9 inches in height. In fig. 14 a flowering example of this plant is shown.

PLANTS AND THEIR CULTURE.

POTTING AND SHIFTING PLANTS.—Soon after this date the work of the plant grower commences in earnest, and much time may be saved by previously preparing the materials used. The various kinds of

water carefully, and place the plants at the warmest corner of the stove, syringing the plants when the weather is fine, but not otherwise, for the present month. By getting these plants started into growth early, and allowing them to grow freely along the roof, and getting all the sun and light they can, the bloom, if the plants are well treated, will last for several months. Another lot of plants may be started in two or three months' time, and these will furnish the house with bloom till late in the year.

A plant or two of *Clerodendron Balfourianum* started into growth now, will be found of service, and unless much larger specimens than last year's are desired, the roots should not be disturbed; but if it become necessary to give a shift, the compost into which the plants should be shifted should consist of two parts good loam, one of rough fibrous peat, and the remainder may be decayed cow-manure, pieces of charcoal, and coarse sand, taking care not to break the old ball of earth, but only remove the loose crocks, and after repotting, place the plants at the

FIG. 14.—DARLINGTONIA CALIFORNICA IN FLOWER.

soils should be put under cover, either in sheds or by thatching the heaps outside, and in any case it should not get frozen. Peat may be prepared for use, and leaf-mould sifted, a good supply of both river and silver-sand being secured, and see that it comes from a clean source, and is free from any admixture, and not of too fine grain. All dirty pots ought to be washed, and new ones bought if found necessary, before the busy season begins. All the crocks required for draining pots should be washed, and sharpened in readiness for use. The compost should now be got in readiness for the first lot of *Allamandias* and *Bougainvillea glabra*, these being plants that are invaluable for cutting purposes when specially grown. The plants will have been kept dry during the last three months, and may be pruned back, and the roots placed in a tub of water till the mass of soil is thoroughly wetted, and laid aside to drain, the old loose soil being then removed, and some of the larger roots cut off. The repotting should be done with good fibrous yellow loam, to which rotten manure and bone-dust have been added in small quantities, and some half-inch bones placed over the drainage; make the soil firm by ramming it,

cooler part of the stove, keeping them close to the light, and watering them very carefully till the new growth is several inches long. *Ixoras* should likewise be started for early blooming, and these, having been kept rather drier, may now be pruned back, and repotted shortly in a compost consisting of three parts peat, to one of loam, together with a liberal quantity of coarse silver-sand, small pieces of charcoal, and a few half-inch bones, the latter being put over the crocks. Give them a place in a close pit, and a day temperature of 70° to 80°. As I have before observed, the old *I. coccinea* is still one of the best to grow for cut bloom. *Dipladenias* should be now starting into growth, and given the same treatment as advised for *Ixoras*, affording some bottom-heat if possible, and training them near the glass, the roof-glass being covered at night with a thick covering to maintain an even temperature. If *Stephanotis floribunda* is wanted to flower early, plants of it may be started in heat, but for this purpose the plants must have had a good rest, and have been kept in a cool house for several months. The plants should be pruned, and as soon as new growth commences, repotting must be done, thoroughly saturating the root masses previously. The compost

may be that advised for Allamandas. The plants should be syringed daily. A few of the earliest pots of Gardenias may be brought on in a temperature higher than that which the plants have wintered in, and manure-water afforded them after a week or two, or the flower-buds will be undersized. The bottom-heat may range from 80° to 90° at this date. Succession plants of Gardenias must be kept scrupulously clean, or the blooms will be of no value, and with proper attention the merely bug pest is easily kept in check. Plants of Plumbeo rosea going out of bloom should be kept a little drier for a time, that is, until new growth forms: and cuttings should be secured

may not unreasonably be inferred. And that this has been done with some accuracy is evident from the tone of your editorial remarks upon the action of the Council of the Royal Horticultural Society in insisting that *all* who take part in the affairs of the latter should be subscribing members of its body. This is a matter on which a little plain speaking appears desirable. I was a member of the Council at the time the decision was arrived at, and I cordially approved and supported it. It is important, to get a clear view of the question, to consider what the Royal Horticultural Society in its present condition really is. It is a body of persons who have

acted directly with horticulture" are to enter it gratuitously by a back door? At the time the Council's decision was arrived at it is notorious that the Society was greatly straitened for want of means. It was absolutely necessary to get rid of these anomalous privileges which were part of the "damnos hereditas" of South Kensington. Its action in placing all the members on the same footing as regards payment, is said to have been "discourteous and ill-judged." Well, it is better to have these epithets hurled at one's head than to be courteous with other people's money and at other people's expense. In my opinion it would have been repugnant to common honesty to make a present of their subscription (in any but the exceptional cases provided for by the bye-laws), to any person with a sufficient taste for horticultural pursuits to wish to take part in our proceedings. That "any gentleman or amateur" should feel himself delinquent from doing so by the obstacle of a guinea subscription is inconceivable. In any case if there be such persons, we must do our best to get on without them. *W. T. Threlton Dyer, Royal Gardens, Kew.* [As to the particular point raised, whilst there is no doubt as to the general correctness of the position taken up by Mr. Dyer, it is precisely to the exceptional cases mentioned by our correspondent that our remarks applied.—Ed.]

The much esteemed Hon. Secretary of this society exhibits some impatience when the acts of his Council are subjected to adverse criticism, but the fact must be recognised that a society is a democracy, and a body not to be governed despotically, but by the general consent and approval of all its members, therefore it should be the duty of the Council to gather so far as possible, the general views of the members, and in this case especially, the opinions of the active working members, so as to bring the actions of the society into harmony with general opinion. To that end the Council should welcome heartily criticisms from every quarter, and especially adverse ones, because it is through these chiefly that the mind of the mass of the members is gauged, and defects of administration not visible to the official eye are discovered. It is best to think in all these cases that every critic has the welfare of the society at heart. It would be very wrong indeed to imagine otherwise. Let me make it clear that however much it may be needful to differ from what is sometimes done, yet Mr. Wilks is such an energetic, hard-working secretary, that much is tolerated for that reason, which all the same may be thought to be wrong. Now the frequent criticisms and references made to the diverse acts of the Council, especially in relation to the Committees, show that there is a very wide interest in the society's welfare existing in the community, and for that interest the Council should be very grateful. No similar society in the kingdom evokes one-half the interest. But those F-floos who do object to anything done by the Council, no matter how trifling, have their annual constitutional opportunity close at hand. The general meeting takes place next month, and on the moving of the adoption of the report, the widest range of subjects connected with the society can be discussed and I suggest that it would be well to take advantage of that chance to raise a full discussion respecting the appointment of the Committees, and their general treatment. All the members of these bodies should remember that they are now fellows, and can exercise at the general meeting the full right of members, to demand explanations, and urge changes of administration. I fear generally the Council have overlooked the fact that in regard to their later treatment of members of the Committees, that many of those gentlemen are called to adjudicate upon more important matters than they do at the Drill Hall, that they are paid liberal fees, also travelling expenses, and have all due refreshments provided for them, and that their decisions, often of the highest importance, are not supervised as at the Drill Hall by the Committee of the society they are engaged by. At Manchester, for instance, Mr. Findlay, who is a tower in horticulture, indeed, would never dream of insulting the gentlemen of wide experience he invites on behalf of his council to act as his judges by subjecting their decisions to some supervision by his council—the thing would be too absurd. Their decisions are final, why not so at the Drill Hall? [Because the Council has to bear the responsibility.] The exhibition of a notice on all subjects certified by the Committee, that such awards are subject to the sanction of the Council, are intolerably galling; and I marvel, first, that any body like the Council should subject its Committee to such humiliation—

FIG. 15. DAHLIA PINNATIFIDA CALIFORNICA. (SEE P. 84.)

as soon as possible from the young growth. If large plants be desired the old stock should be repotted, removing a large portion of the old soil and some of the strong roots. *G. Wythes, Syon Gardens.*

agreed to co-operate for the attainment of certain ends which individually they cannot achieve. The first requisite for doing anything is obviously the possession of a common income. The main source of this is the contribution of the members. Now the present constitution of the society is essentially democratic; it is composed of all classes of the community. The constitution of the governing body, the Council, is in the hands of the members, and its present composition reflects that of the Society itself, consisting as it does of amateurs, officials, nurserymen, and gardeners. What ground in equity or common sense then is there for granting to individuals pecuniary privileges which are not shared by all? How can we invite persons interested in horticulture, but often of very moderate means, to join our body if "many amateurs and gentlemen uncon-

HOME CORRESPONDENCE.

THE ROYAL HORTICULTURAL SOCIETY.—It may be conceded that within the limits of fair criticism the editor of a paper is not responsible for the opinions of any correspondent. But when the paper is made the channel for a persistent donche of fault finding, too often without any adequate basis, the sympathy of the editor with the malcontents

but still farther do I marvel that the Committees should submit. But after all, the general meeting is the proper place to thresh out all grievances, and the actual desire of the Committees for more freedom and liberal treatment will then be tested. *A Fellow, but not a Committee-man.* [We quite concur that the general meeting is the proper tribunal, and in spite of these more or less legitimate complaints, we have no doubt whatever that the general verdict must be unmistakably in favour of the Council for the efforts they have made in putting the Society on a proper basis. En.]

CHRYSANTHEMUM SHOW DATES.—It was almost amusing to find "R. D." in the *Gardeners' Chronicle* complaining of the Royal Horticultural Society fixing the date of its November meeting on the same date as that fixed for Kingston and the National Society's Centenary Exhibition, and urging the Royal Horticultural Society to put its meeting a week earlier; whilst in *The Garden* another correspondent complains of the National having fixed its Show dates to clash with Kingston, Birmingham, and other of the provincial shows, and invites the fixing of an earlier date. Probably the Show authorities may exclaim "A plague on both your houses," for it is evident that no date will please everybody. It is worthy of remark, however, that the Royal Horticultural Society did wisely fix the date for its Chrysanthemum Conference of the past year during the first week in November, and doubtless owing to the season being early, and no important Show being antagonistic, was highly favoured. Of course it is not intended to hold in November this year any special Chrysanthemum gathering, but all the same, it does seem as if the meeting must greatly suffer because of the big attraction at the Aquarium. But then there is very much wisdom in the other advice to the National to bring its Show forward a week, as without doubt last year, and probably in most years henceforth, both because it is the rule to strike cuttings earlier, and to house plants in the autumn earlier, and scores of growers last year would have given their eye teeth to have been enabled to exhibit earlier than they finally did, or failed to do. There is just a shade of suspicion that some of the grumbling comes from would-be judges who cannot emulate Sir Royle Bache's Javeana bird, and be in two places at once; but as some of the elect seem to exhibit a desire to grab all the engagements possible, which is little less than avaricious, there will be some consolation found in the fact that others as good but less bold men have got a share of the spoils, which seem so plentiful in the Chrysanthemum show season. O. P. Q.

ARNEBIA CORNUTA.—In a notice of this plant on p. 52, "R. D." speaks of it as "the first annual species of this genus." If he means by this that no annual *Arnebia* has before been cultivated in England, I can assure him that he is mistaken. A few years ago some packets of seed were sent to me from North-Western India, many of which produced flowering plants. One of these when sent by me to Kew, was named *Arnebia Griffithii*, and it was an annual, with flowers very nearly resembling those of *Arnebia echioides*; but the plant, being an annual, was inferior in habit to the perennial and more easily cultivated *Arnebia echioides*, which flowers for half the year; so after recording the flower, I think in the *Gardeners' Chronicle*, I took no trouble to continue its cultivation. *C. Wolly Dod, Edge Hall, Malpas, Jan. 12.*

THE GARDENERS' ORPHAN FUND.—I am very pleased to read "G.'s" letter in this week's issue. A little healthy criticism is always welcome; it shows interest, and does good in many ways. Before helping "G." to see straight, I would just like to say how grateful we of the Committee feel for the very generous and liberal support that has been given to the Gardeners' Orphan Fund ever since it has been established. It is the most earnest desire of the Committee to carry out the wishes of the subscribers, and to give as much assistance to the poor orphans as the funds placed at our disposal will permit of. If "G." will read, I will try to explain—that the monies received for the Fund are of two classes, viz., annual subscriptions, interest, &c. which may be termed income, and secondly, donations, legacies, &c., which have to be invested. The Committee have no power in the matter as the rules at present exist. If the investments seem large in proportion to the annual income, it is simply that the givers preferred giving it so. We never refuse money, whether given in the form of a donation or as income.

"G." is astonished that being able to invest £2525 11s. 10¹/₂d., we could only make allowances of £139 15s. to the orphans "during the past year." This is scarcely a correct statement, the investment of £2525 11s. 10¹/₂d. referring to the balance sheet of 1889, upon which £247 a year is being paid, and the allowances of £139 15s. to the year previous. This is not, however, of much importance. If "G." will kindly turn to the figures again, he will see the annual income, out of which all expenses have to be met, will not admit of much more being done. That some modification of the present rules may now be advisable to adopt so as to bring some of the funds in more direct application, I am disposed to believe would be beneficial. If "G." is disposed to believe that he can secure plenty of annual subscribers—the more subscribers and friends can give in this way the more orphans will be provided for; but the adoption of a policy which be advocates of blind trust in something going to turn up, and incurring responsibilities there are no visible means of meeting, would be sheer recklessness and folly. Prudence begs confidence, and confidence in the management of this Fund has secured the support of a great many gardeners throughout the country. *A. F. Beeson, Hon. Secretary.*

—In reference to the letter, in your last issue, signed "G." complaining that too much money is invested and too little devoted to the orphans, it appears to me that the writer, for whose opinions one would feel greater respect had he signed his name, stands condemned on his own showing. He seems to admit that he is in a hopeless minority, and therefore he can scarcely, with justice, blame the executive for following a course of action which commends itself to the majority. Nothing is easier than to complain in generalities; but let us see how the facts stand. The fund has been established for a period of two completed years. At the first election, all the applicants were elected, so that upon that occasion, I suppose, "G." will admit, all that it was possible to do was done. In arranging for the second election, held in July last, the executive, having no precedents to go upon, took what they considered, and what I venture to aver, was the very wisest course open to them, viz., to seek the opinion and advice of an actuary of one of the largest insurance companies in London. Their appeal was most generously responded to by Mr. A. H. Smee, who after taking considerable pains, strongly recommended that only five candidates should be elected. In the end, however, six candidates were placed on the fund, so that here, I think, the committee showed a careful and wise discretion in the exercise of the power vested in them. What lines of procedure will be adopted at the next election remains to be seen; but I submit that they have hitherto manifested a proper care and forethought for the interests of the fund. But apart from his individual opinion, "G." advocates a course of action in direct opposition to the rules by which the executive are bound to administer the fund. Rule 5 distinctly states that "all donations and legacies (and such proportion of the annual subscriptions as shall be sanctioned by the executive committee) shall be invested in the names of the trustees." While this rule remains, and it is not in the power of the committee to alter it (see rule 15), such a course as that advocated by "G." is impossible, and I venture to add, inadvisable. Has "G." considered what a bad impression would be created in the public mind by an attempt to float an institution like this with a barren exchequer? On very many occasions I have heard the executive congratulated upon the growing solidity of the fund, and upon the public confidence which so goodly an invested sum inspired. Yet another point, and that a very important one, which appears to have escaped the notice of "G." It should be remembered that more than 50 per cent. of our income last year consisted of donations, and 25 per cent. of one donation—£500 by the Duke of Bedford—so that we must not be surprised if the aggregate of our receipts in the current year falls short of that of last year by this amount. Last year must be taken as an exceptional year, for we cannot, of course, count upon anyone else treating the fund with like liberality. Here, then, will commence the advantage of a reserve fund. For these and several additional reasons I could advance, the executive have undoubtedly acted wisely by not launching out too freely until the success of the fund has been assured. First we establish the concern, secure for it a sound reserve fund, and then when some years' experience shall have enabled the Committee to adequately gauge the annual income, it will be easy to estimate the expenditure it will be able to bear. Money

may be rightly spent after having obtained it; but it is the imprudent man who spends it before he gets it. A steady, solid growth, with a corresponding annual accession to the number of orphans, will inspire greater confidence, and will work to greater advantage than a spasmodic rush into a position from which we might find it difficult to retreat. I need hardly say that if "G." has any practical suggestions to offer, and will communicate them either to Mr. Barron or myself, he may rest assured that they will be duly submitted to the executive, by whom I feel sure they will be gratefully appreciated. *Geo. Deal, Chairman of Committee.*

DUBLIN.—Lovely weather here, like Nice or Genoa. *Parosiss minutus*, *N. pallidus-praxos* in flower; Narcissus by the hundred, *Iris reticulata*, *I. cyanea*, and the new golden *I. Bonumilleri*, a dainty gem; as is also *Iris stylgia alba*, with its *Celyogone cristata*-like flower; Christmas Roses, and long have been, very floriferous and accessible to our friends as grouped with the ruddy leaves of *Tellina grandiflora rubra*, a *Heuchera*-like plant, not known, as I believe in England, where the green-leaved type is common. *Saxifraga Bursleriana major* is such a gem. Snowdrops are budding up through the soil; *Galantus Elwesi*, *G. umbrius*, from Central Italy; *G. imperati*, from Naples; and several other species are *en evidence*. *F. W. Burbidge.*

THE HABITATS OF PLANTS, &c.—*A propos* of this note, p. 55 in your issue for January 11, I never saw *Lilium auratum* growing wild in Japan, or as a vegetable, or with more than five or six flowers on one stem, but the flowers seemed individually larger than ours. *J. Van Tolken.*

RAILWAY RATES.—By your notice on railway rates it does not appear that any advantage has been gained on present rates, at any rate so far as the Great Eastern Railway is concerned. On page 755, vol. vi., col. a, line 17, "If in quantities of less than 500 lb. at passenger train rates, for small parcels at per cent. per mile." The next paragraph explains the "smalls," and I find that 28 lb. sent 50 miles will be 1s. 10¹/₂d.,—present charge by above railway is 7¹/₂d. Also 56 lb. sent 50 miles will be 2s. 9¹/₂d.,—present charge for the same is 10¹/₂d. You do not state if every package is to be weighed and charged separately by the same train; if so, the favourite cross-handle basket will be useless, for hothouse fruit in large packages are very risky consignments, so I trust they are to be charged and weighed as one. Where is the British Fruit Growers' Association that blew a loud blast two years ago? *R. Farraner.*

A HORTICULTURAL HALL.—We are very pleased to see you are giving publicity to suggestions as regards a hall for horticulture. After reading the various comments respecting it, many must have been surprised at the wide difference of opinion as to the best method of attaining the object in view. The Editor in the *Gardeners' Chronicle*, Jan. 4, 1890, in reviewing our circular which proposes to solicit donations from the wealthy who have horticulture at heart, remarks "Like our friends we too hope to see the day when we shall have 'a hall worthy of our great nation,' and one which shall be available not only for the meetings of the Royal Horticultural Society, but of all the Special Societies, of the Library, of the Horticultural Club, of the charitable societies connected with horticulture. This has been a dream for many a long year, but when we see the proposal being sent broadcast we begin to hope the dream may be fulfilled." Our friend, Mr. Hibberd, in the *Gardeners' Magazine*, *Gardeners' Chronicle*, *Journal of Horticulture*, *Gardening World*, and probably a host of other papers, says if our suggestions are carried out it will be a mockery, delusion, and a snare, and almost commands his friends not to have a hand in such an awful and dangerous work; yet the very same means we suggest are adopted to build nearly all our churches, chapels, and many other public buildings, and how your readers will understand and reconcile the statements coming from two such distinguished men is beyond comprehension. However, delighted to think that we have been the means of publicly uncovering the light which Mr. Hibberd has so long kept under a bushel. If he alludes to us as the friends who heard of his scheme—a sort of a pseudo-joint-stock market or co-operative store company or some such kindred title—our friend was never more mistaken in his life; he should be sure, and certainly show some evidence before putting forth such statements. Mr. Hibberd

also speaks of a resolution he put to the meeting in 1888, and lost. A year before that, in the side room at the Albert Hall, we asked the Council not to finally engage the Drill Hall until the Fellows had had time to consider its adaptability; and again at the same meeting, he asked the Fellows to agree that we should ask the Crystal Palace Company; this was also lost, consequently, here is far more ground for considering that his ideas were borrowed from us. He was present on both occasions, and probably heard us converse with many persons about procuring a site on the Thames Embankment. We think we are safe in saying very few projects have had a happy time where capital has had to be borrowed for horticultural purposes. Many have had, we know, a disastrous ending. No one knows the extent of such, better than our friend, yet he almost makes it appear as if the Horticultural Society is not doing as much good work and is deserving of sympathy, as any of the Polytechnic Institutions whose elementary donations are to the extent of £50,000 a year in London. Our friend is so definite and determined on this point, that we are afraid if some well-wisher were to bequeath us, for this Hall, a thousand or so in the same way as Mr. Davies, Mr. H. would by his teachings be for immo-hately re-termining such donation, and saying it would lower the dignity and injure the very foundation of our society; every farthing to build this hall must be obtained by its own commercial pursuits, and of course be called "The Royal Horticultural Hall Trading Co., Limited," the very thing in our opinion to destroy its character, independence, and all the purposes for which the Society is intended. However, judging from the several enquiries of the sort of building needed, our hopes are more and more strengthened that we shall have assistance from some amongst the great and wealthy of this country, and so be enabled to place the society in a comfortable and becoming building, equal to those possessed by horticulturists in Belgium and America, to which we could look up with pride and pleasure, and feel that the Society was advancing in the improvement and encouragement of horticulture. *H. Cannell & Sons.* The matter has been talked of so long and by so many people that we think it would be very difficult to say who was the originator of the scheme. E.]

SERVICE-TREE BEER.—It is commonly asserted, as on page 650 of the *Gardener's Chronicle*, vol. vi., that the English name Service-tree, as applied to *Pyrus Aria*, *P. Sorbus*, and their kind, is derived from the Latin word *servisus* (beer), because this drink was formerly made from their berries or leaves? The subject is not new to me, but I have again searched my not very large library to find out (1) what is most likely to be the derivation of Service-tree; (2) whether beer ever was made from the Service-tree or its congeners; (3) what the Latin word *servisus* really means.

1. To change the initial *s*, pronounced hard in old Latin, into *s*, is a violation of the ordinary rules of etymology; but in *d* derivatives from Latin *s* is often changed into *r*, and sometimes into *c*. The old Latin name of the Service-tree is *serphis*, in French *serphis*, and in Spanish, according to Gerard's Herbal, the berries are called *serphis* or *seronis*. I think it more probable, therefore, on philological grounds, that *servisus* is a corruption of the old Latin name. Certainly the good old Saxon name, White-beam, might, for the reason alleged, have been changed into Service by some pedantic herbalist of the sixteenth century, had it really been used in making *servisus*, but I find no trace of such an origin.

2. Virgil tells us (Georgic III., 380) that nations living north of the Danube spent the winter in underground houses, where in their nightly jollifications, they burnt elm trees whole, and drank home-made wine made of leaves (*fermentum*) and sour Service-berries (*serbis*). Virgil's words are obscured in poetic elegance, but all the editors have followed one another in suggesting that the drink was beer (*servisus*). I find no other passage in the Latin classics in which *serbis* are mentioned as the ingredients of a drink, except in Pliny, who names them amongst fourteen kinds of fruit, such as Apples, Mulberries, Cornels, and Medlars, which were used in making imitations of grape wine (*vinum fictitium*), but these wines as the context shows, were not like beer, but like what we call home-made wines, such as are now made from Elder-berries, Goose-berries, Currants, &c. But Evelyn in his *Sylva*, describing the Mountain Ash or Crick-beam, a close ally of the White-beam, says, "Ale and beer brewed with these berries, being ripe, is an incomparable drink, familiar in

Wales." He tells us also in another chapter that the fruit of the Service-tree "makes a condiment of admirable effect to corroborate the stomach," but I search in vain for anything to corroborate his statement about the ale and beer, though it may be true. Gerard, who is full on the "virtues" both of the Crick-beam and the White-beam, says nothing about their use in brewing.

3. Pliny is the only Latin classical writer in whose works we find the word *servisus*. He uses it of a drink made of cereal grain in Gaul, and other Roman provinces. In Spain it was called *cris*, he might have added that in Britain it was called *cris*, which, with a Latin termination, he would have spelt very like *servisus*. This name is supposed to have been adopted, and changed to Latin, from the language of the conquered Celtic nations, who used the drink, and to whom the same word went back again in its Latin form, becoming in French *cris*, in Spanish *crisita*, and in Italian *crisita*. Our Briton ancestors, no doubt, brewed their *cris* from good malt, and not from anything so nasty as Service-berries. Malt, as Herodotus tells us, was in use amongst the ancient Egyptians, who called it "Zyth." Xenophon welcomed the same drink amongst the Armenian mountaineers, where he and his soldiers were dying of cold. He does not tell us its native name, but says that it was good, but very strong. Tacitus describes the malt ale of the ancient Germans, and Dioscorides, who calls it *crisus* (again the Celtic root of *cris*), says it was drunk by the Spaniards and Britons, as well as the ancient Egyptians. Having stated my case to show that *servisus* was not Service-tree beer, I leave the matter to the judgment of the readers of this journal. *C. Wolley Dod, Edge Hill, Malpas.*

SYCAMORE BUDS AND SQUIRRELS.—A few days ago when passing through a group of Sycamores, I was astonished to see a large quantity of leaf buds strewn on the ground under the trees, and thinking that birds were the authors of the mischief, I looked up to see which species of bird it was. To my surprise, instead of birds, I saw a squirrel very nimbly leaping from branch to branch, and apparently selecting the buds, but for what purpose I could not determine; but it seemed as much for mischief as for food, seeing that the buds were dropped as soon as bitten off. It would be interesting to know if any readers of the *Gardener's Chronicle* have previously noted the occurrence, and if it is usual for squirrels to bite off the buds of the Sycamore. Although squirrels are rather plentiful here, and injure many of the conifers, no person to whom I have spoken on the subject has known them to have attacked the Sycamore before. May not the scarcity of Fir cones and buckmast account for the injury done? *J. Whitton, Glamorgan.*

HELLEBORUS NIGER V. ANGSTIFOLIUS.—At the present time there is a good display of this fine variety of Christmas Rose in the York Nurseries, some of the plants being very large, and with over one hundred snow-white blossoms on each. This is the plant which is grown so freely in the vicinity of Manchester, and is in consequence sometimes called the "Manchester variety." For gardens where the loam is of a sandy nature, it is the best possible variety to grow; if, however, the loam is heavy and inclining to clay, *H. niger v. altissimus (maximus)* should then be planted, it being one that is best suited for such soils. *R. P.*

A group of nicely grown Ferns in pots was staged by Mr. H. B. May, Dyson's Nursery, Upper Edmonton, in which were some very useful Ferns. There were a fine plant of *Nephrolepis davallifolia*, *Adiantum ciliare*, the crested compact *Pteris cretica nobilis*, *Adiantopsis radiata*, *Lygodium dichotomum*, *Gymnogramma multicipes*, a vigorous growing fern, and heavily crested, also a large example of *Pteris serrulata gloriosa*, a very full crested form, to which an award was made; it is likely to be of much use as a decorative plant. From Messrs. J. Veitch & Sons, Chelsea, S.W., was sent an interesting collection of Pitchers of *Nepenthes*, showing species and hybrids. There were examples of all the best kinds, which may be seen by the list given.

<i>Nepenthes</i> <i>curtisii</i>	<i>Nepenthes</i> <i>curtisii</i>
<i>Nepenthes</i> <i>Northiana</i>	... <i>lexisii?</i>
... <i>curtisii</i>	<i>Garden Hybrid</i>
... <i>leucostriata</i>	<i>Nepenthes</i> <i>chelon</i>
... <i>hirsuta</i> <i>glabrescens</i>	... <i>cyathina</i>
... <i>(rubra)</i> <i>(solanum)</i>	... <i>Dicksoniana</i>
... <i>(rubra)</i> <i>(zeylanica)</i>	... <i>Dominiana</i>
... <i>gracilis</i> <i>major</i>	... <i>Coccinea</i>
... <i>Hockiana</i>	... <i>coccinea</i>
... <i>(longata)</i> <i>submarginata</i>	... <i>hybrida</i>
... <i>submarginata</i>	... <i>menclata</i>

... <i>Vittata</i> <i>major</i>	... <i>Wrightiana</i>

A number of flowering plants of *Anaeris* *aulica* were sent by Mr. O. Thomas, Chatsworth Gardens, Chesterfield. They were vigorous specimens, and were laden with their richly coloured flowers.

A collection of nine varieties of the Chinese Primrose, all singles, was sent by Messrs. H. Cannell & Sons, Swanley, Kent, and were well flowered, good habit plants; the best varieties being *Her Majesty*, a large pure white flower with a conspicuous eye; *Eynford Pink*, rosy-pink—very elegant; and *Eynford Red*, bright shaded crimson, and frilled edges to the petals.

Messrs. Paul & Son contributed specimens of *Spiraea astilboides* in flower, and *Arum sacatum*, with the spadix and interior of the spathe deep purple-brown.

Blooms of a dwarf variety of *Richardia atropica* were sent by Messrs. Walsham & Son, nursermen, Scarborough; and from Messrs. Barr & Son, Galanthus *Elwesii*, various *Crocuses*, and *Narcissus minor*.

Orchid Committee.

Present: Sir Trevor Lawrence, Bart., M.P., in the chair; and Messrs. James O'Brien, H. J. Veitch, F. A. Phillbrick, Baron Schroder, De B. Crawshaw, F. G. Taitz, T. B. Haywood, E. Hill, H. Ballantine, H. M. Pallett, J. Doinny, C. Pichler, L. Castle, J. Douglas, and F. Moore.

From the gardens of Sir Trevor Lawrence, at Barford Lodge, Dorking, came an interesting collection of *Dendrobium*, comprising *D. nobile*, *Tollmann*, *D. n. Cookson*, and a new form of *D. nobile*, distinguished as *D. n. Burford* variety; it exhibits the characteristics of *D. n. Cookson*, but the markings similar to those on the labellum, are on the sepals instead of the petals. Three very handsome hybrid *Dendrobies* were also exhibited in this collection, viz., *D. xanthocentrum* ×, which somewhat resembles *D. Schneiderianum* ×. The flowers partake much of the characters of *D. Findlayanaum*, which was one of the parents. It is white, with a rosy flush on the petals and sepals, darker at the tips; lip broad, and almost round, drawn to a slight point, which was of the same rosy-purple as the other parts. In the throat was a rich orange blotch. Another was named *Dendrobium Juno* ×, and was the result of crossing *D. Wardianum* and *D. Linawianum* (*moniliforme*). Its flowers resembled those of *D. nobile nobilis*, but with the dark blotch and orange-yellow of *D. Wardianum* in the lip. The third is a charming novelty named *D. Luna* ×, with growths and flowers of the same form as *D. Findlayanaum*, which, with *D. Ainsworthii*, was its parent. Its flowers are white, with sulphur-yellow at the base of the lip, and pale pink tips to each of the segments. From the same gardens also came *Laelia Patinii*, *Reh. L.*, which is probably a variety of *Cattleya Skinneri*, and a distinct form of *Laelia pumila* named "El Spirito Sancto."

From Baron Schroder's collection, at The Dell, Egham, Mr. H. Ballantine brought cut spikes of a fine representative collection of white *Laelia anceps*—

SOCIETIES.

ROYAL HORTICULTURAL.

JANUARY 11.—The first of this year's meetings of the several committees was held in the Drill Hall at Westminster last Tuesday, when, although the plants exhibited were by no means numerous, there was a strong muster of horticulturists, and also in the afternoon, during the instructive Lecture on "A Form of Winter Gardening," which was given by the Rev. W. Wilks.

Floral Committee.

Present: Dr. M. T. Masters, F.R.S., in the chair, and Messrs. R. Dean, T. Baines, F. Ross, H. Herbst, J. Walker, G. Nicholson, H. B. May, H. Cannell, W. C. Leach, P. Blair, B. Wynne, H. Turner, C. Noble, G. Paul, J. Fraser, R. B. Lowe, and W. Holmes.

L. a. Dawsoni, L. a. stella, L. a. Sanderiana, L. a. Veitchiana, L. a. Percivaliana, and the true L. a. Schroderiana, a very different form from the variety of L. a. stella, which is found under that name in gardens.

De B. Crawshaw, Esq., Rosefield Sevenoaks, contributed a plant of *Laelia Crawshawiana*, and a cut flower of it, and also of *L. Gouldiana* and *L. anceps*, for comparison, from Messrs. F. Sander & Co., St. Albans.

Frederick G. Tantz, Esq., Goldhawk Road, Shepherd's Bush (Mr. Cowley, gr.), sent well-flowered plants of the pretty *Cyclopogon longiginosa*, with rich yellow-brown flowers; *Lycaste plena* Measuriana, and three fine forms of *L. Skinneri*, that named "Lucyana" being white suffused with pink; and the variety "Imperator" had large and well-formed flowers, whose lip and petals exhibited fine crimson colouring, both being very delicate and pleasing.

Another very handsome variety, *L. Skinneri rubra*, came from the gardens of N. N. Sherwood, Esq., Dunedin, Streatham Hill. It is one of the broadest in the segments of any of the varieties of *L. Skinneri*, and has very dark, dull, rosy colour on lip, sepals and petals, and is very striking.

E. Harvey, Esq., Riverdale, Aigburth, Liverpool, staged a fine specimen with five spikes of a rather small flowered variety of *Laelia anceps* of the *L. a. Williamsii* type. From Mr. Johnson, gr. to T. Statter, Esq., Stand Hall, Whitefield, Manchester, came a good plant of a nearly white form of *Vanda Amesiana*, with one piece of the coloured variety for comparison. The plant had six spikes, and its fragrance was remarkable.

Mr. Blair, from the Duke of Sutherland's gardens at Trencham, brought a good specimen of a pale variety of *Cattleya Trianae*, with seven flowers, the parts of flower being faintly suffused by rosy-purple. It was named *C. t. albescens*. A large and well grown specimen of *Lycaste plena*, with many fine flowers, was contributed by E. Ellis, Esq., Manor House, Wallington (gardener, Mr. G. A. Glover).

One of the most interesting of the exhibits was *Dendrobium Macfarlanei*, from Messrs. Jas. Veitch & Sons, Chelsea. The growth of the plant is much like a slender *D. suavisimum*, and it had an upright spike bearing two snow-white flowers, with some violet on the side lobes of the labellum. It is a valuable introduction from Torres Straits, and its flowers vividly call to mind a white *Laelia anceps*. They are borne often ten or twelve on a spike. The sepals are pure white and lanceolate, about $\frac{1}{2}$ inch long, and $\frac{1}{2}$ inch or more wide at the base; petals are pure white, and as long as the sepals, of rhomboid form, being nearly $\frac{1}{2}$ inch across at the widest part. The lip has a conspicuous median lobe about $\frac{1}{2}$ inch in length and $\frac{1}{2}$ inch across, it is oval, and notched into three points at the tip. The side wings are closed around the column, and bear a few lines of violet, which is indeed the only trace of colour in the entire flower. Messrs. Veitch also contributed *Cypripedium Calypso* ×, a variety approaching *C. Lathamianum* ×, and under the name *C. Masereianum* ×, Messrs. Pitcher and Maunda, of the United States Nursery, Short Hills, New Jersey, U.S.A., sent a hybrid between *C. Spicerianum* and *C. insigne* Chantini, which the committee decided as *C. Leeanum* ×. Mr. Myles, Abbey Tower, Ryde, Isle of Wight, forwarded a twin-flowered *C. insigne* similar to those frequently seen of late years.

Fruit Committee.

Present: J. Lee, Esq., in the chair; and Messrs. P. Crowley, P. Barr, C. Ross, J. Cheal, G. Cliffe, W. Domy, G. Norman, A. Watkins, W. Warren, J. Wright, A. H. Pearson, G. W. Cummins, G. Bunyard, W. Wildsmith, F. Lane, H. Balderson, T. J. Saltmarsh, R. D. Blackmore, W. Coleman, J. Hudson, J. Smith, and Dr. R. Hogg.

From the Society's gardens at Chiswick were sent a few varieties of Broccoli, the best of which appeared to be Snow's Winter White—good solid heads; Improved Early Purple Sprouting, White Sprouting, and Early Penzance.

A fruiting-plant of a *Carica* was contributed by Mr. O. Thomas, Chatsworth Gardens, Chesterfield, with a good cluster of fruit, ripe and unripe, the individuals were small oval fruits, lemon-yellow, and quite smooth.

A collection of good sound fruits of Apples was sent by W. Roupell, Esq., Harvey Lodge, Roupell Park, S.E. There were in all twenty varieties, the best being Peasgood's Nonsuch, Alexander, Cox's Orange, Lane's Prince Albert, Cellini, Bismarck, Melon, The Queen, and Beauty of Kent. They were

shown as having been grown within the 5 miles radius.

Mr. A. Dean, Bedford, Middlesex, sent two samples of Spanish Onion, one the large soft exhibition type, the other smaller, heavy fine examples, much more useful.

Mr. Miller, gr. to Lord Foley, Esher, sent two boxes of Mushrooms from inside and outside beds. Mr. Miles, Apple Towers, Ryde, I.W., sent his new grape, Apple Towers, and another white seedling, Lady Hatt.

Mr. H. Morris, Tarbach, S.W., sent a fine Pine, and Mr. Cummins, gr. to A. H. Smee, Esq., The Grange, Wallington, sent Apple Romborough, much like King of the Pippins in form and general appearance.

Awards were made as follows:—

By the FLORAL COMMITTEE.

Awards of Merit.

To *Pteris serrulata gloriosa*, from Mr. H. B. May (unanimous).

To *Primula Eynford Pink*, from Messrs. H. Cannell & Sons (9 votes to 1).

To *Primula Her Majesty*, from Messrs. H. Cannell & Sons (unanimous).

To *Primula Eynford Red*, from Messrs. H. Cannell & Sons (unanimous).

Medals.

Silver Banksian, to Messrs. J. Veitch & Sons, for group of Nephthes.

Bronze Banksian, to Mr. H. B. May, for group of Ferns.

By the ORCHID COMMITTEE.

First-class Certificates.

To *Dendrobium xanthocentrum* ×, from Sir T. Lawrence (10 votes to 3).

To *Dendrobium Juno*, from Sir T. Lawrence (unanimous).

To *Dendrobium Luna*, from Sir T. Lawrence (11 votes to 2).

To *Dendrobium Macfarlanei*, from Messrs. J. Veitch & Sons (unanimous).

To *Laelia anceps Schroderiana*, from Baron Schroder (unanimous).

Award of Merit.

To *Dendrobium nobile Burford* var., from Sir T. Lawrence (unanimous).

Cultural Commendation.

To E. Ellis, Esq., for *Lycaste plana*.

The following is the list of members of Committees for the current year.

FLORAL COMMITTEE.

Chairman.—William Marshall, Auchincraith, Bexley.

Vice-Chairman.—Shirley J. Hibberd, 1, Priory Road, The Green, Kew; Maxwell T. Masters, M.D. F.R.S., Mount Avenue, Ealing, W.; George Paul, The Old Nurseries, Chessnut.

Secretary.—Archibald F. Barron, Royal Horticultural Society, Chiswick, W.

Baines, Thomas, Fern Cottage, Palmer's Green, N. Barlow, S., Manchester.

Barbridge, F. W., Trinity College Botanic Garden, Dublin.

Blair, P. C., Tretham Gardens, Stoke-on-Trent. Cannell, H., Swanley, Kent.

Castle, L., Hotham House, Merton.

Dean, R., Ranclough Road, Ealing, W.

D'Ombra, Rev. H. H., Westwell Vicarage, Ashford, Kent.

Douglas, J., Great Gearies, Ilford.

Drury, C. T., 25, Windsor Road, Forest Gate.

Fraser, John, Lea Bridge Road, Leyton, E.

Girdlestone, T. W., Sunningdale, Berks.

Goldring, W., 52, Gloucester Road, Kew.

Herbst, H., Kew Road, Richmond, Surrey.

Hill, E., Tring Park Gardens, Tring.

Holmes, W., Frampton Park Nurseries, Hackney, E.

Ingram, W., Belvoir Castle Gardens, Grantham.

James, J., Farnham Royal, Slough.

Jeffries, C., Boston House Gardens, Brentford.

Kelway, W., Langport, Somerset.

Leach, W. C., Albury Park Gardens, Guildford.

Lindsay, R., Botanic Gardens, Edinburgh.

Low, R. B., Ashbridge Gardens, Berkhamsted.

May, H. B., Dyson's Lane, Upper Edmonton.

Mawley, E., Rosebank, Berkhamsted.

Molyneux, E., Swanmore Park Gardens, Bishops Waltham.

Nicholson, C., Royal Gardens, Kew.

Noble, C., Sunningdale Nursery, Bagshot.

O'Brien, James, West Street, Harrow-on-the-Hill.

Pilcher, Charles, 84, Ringford Road, Wandsworth, S.W.

Pollett, H. M., Fernside, Bickley, Kent.

Ross, F., Tendell Court Gardens, Bletchingly.

Robson, Owen, Chatsworth Gardens, Chesterfield.

Turner, H., Royal Nurseries, Slough.

Walker, J., Ham Green, Surrey.

Williams, W. H. (Keynes & Co.), Salisbury.

Wynne, B., 17, Catherine Street, Strand, W.C.

NOTE.—Members of the Council are Members of all the Committees.

ORCHID COMMITTEE.

Chairman.—H. J. Veitch, F.L.S., Royal Exotic Nursery, Chelsea, S.W.

Vice-Chairman.—J. Douglas, Great Gearies, Ilford; Maxwell T. Masters, M.D., F.R.S., Mount Avenue, Ealing, W.

Secretary.—James O'Brien, West Street, Harrow-on-the-Hill.

Baines, Thomas, Fern Cottage, Palmer's Green, N.

Ballantine, H., The Dell Gardens, Staines.

Castle, L., Hotham House, Merton.

Crawshaw, De Barr, Rosefield, Sevenoaks.

Cookson, Norman C., Oakwood, Wylam-on-Tyne, Courtauld, Sydney, Bocking Place, Braintree.

Domy, John, H., Tadema Road, Chelsea, S.W.

Haywood, T. B., Woodhatch Lodge, Reigate.

Hill, E., Tring Park Gardens, Tring.

Latham, W. B., Botanic Gardens, Edgbaston, Birmingham.

Lawrence, Sir Trevor, Bart., M.P., 57, Princes Gate, S.W.

Lindsay, R., Botanic Gardens, Edinburgh.

Moore, F., Blendon Hall Gardens, Bexley.

Philbrick, F. A., Q.C., Oldfield, Bickley Park.

Pilcher, Charles, 84, Ringford Road, Wandsworth, S.W.

Pollett, H. M., Fernside, Bickley, Kent.

Sander, F., St. Albans.

Schroder, Baron Henry, The Dell, Staines.

Smee, H. J., Wallington, Surrey.

Tantz, F. G., Studleigh House, Goldhawk Road, W.

Williams, H., Victoria Nurseries, Holloway, N.

FRUIT AND VEGETABLE COMMITTEE.

Chairman.—Sir Charles Strickland, Bart., Hildenley, Malton.

Vice-Chairman.—T. Francis Rivers, Sawbridge-worth; John Lee, 78, Warwick Gardens, Kensington; R. D. Blackmore, Teddington.

Secretary.—Archibald F. Barron, Royal Horticultural Society, Chiswick, W.

Balderson, H., Corner Hall, Hemel Hempstead.

Burr, Peter, 12, King Street, Covent Garden, W.C.

Bates, W., Foullet Lodge Gardens, Twickenham.

Bennett, W., Rangenore Park Gardens, Burton-on-Trent.

Bisnary, George, The Nurseries, Maidstone.

Cheal, J., Crawley, Sussex.

Cliffe, G., Shoreham Place Gardens, Sevenoaks.

Coleman, W., Eastnor Castle Gardens, Leicestershire.

Crowley, Phillip, Waddon House, by Croydon.

Cummins, G. W., The Grange Gardens, Wallington.

Denning, W., Heathfield Nursery, Hampstead.

Dunn, Malcolm, The Palace Gardens, Dalkeith, N.B.

Fairgrieve, P. W., The Palace Gardens, Dunkeld, N.B.

Ford, Sidney, The Gardens, Leonardlee, Horsham.

Hogg, Dr., J.L.D., F.L.S., 99, St. George's Road, Pimlico.

Haycock, C., Goldings, Hertford.

Hudson, J., Gunnersbury House, Acton.

Lane, Fred, Q., Berkhamsted.

McIndoe, James, Hutton Hall Gardens, Guisborough.

Moore, F., Blendon Hall Gardens, Bexley.

Moss, A., 39, London Bridge, E.C.

Norman, G., Hatfield House Gardens, Hatfield.

Pearson, A. H., The Nurseries, Chilwell, Notts.

Ross, Charles, The Gardens, Welford Park, Newbury.

Saltmarsh, T. J., The Nurseries, Chelmsford.

Smith, James, The Gardens, Mentmore, Leighton Buzzard.

Sutton, A. W., F.L.S., Reading.

Veitch, H. J., Royal Exotic Nurseries, Chelsea.

Veitch, P. C. M., The Royal Nurseries, Exeter.
 Watkins, A., Exeter Street, Strand.
 Warren, W., Worton Gardens, Isleworth.
 Weir, Harrison, Sevenoaks.
 Wildsmith, W., Heckfield Place, Winchfield.
 Willard, Jesse, Holly Lodge Gardens, Highgate, N.
 Wright, John, 171, Fleet Street.
 Wythes, G., Nyon House Gardens, Brentford.

NOTE.—Members of the Council are Members of all the Committees.

ANCIENT SOCIETY OF YORK FLOWERS.

A well attended annual meeting was held last evening in the White Swan, York, under the presidency of Mr. G. Lamb. Mr. Lazenby, secretary, read the annual report, which stated that the committee had again the pleasure to announce very satisfactory results from past year's work. There was a large increase in the number of members, the receipts from this source being augmented by about £22. Despite the increase of the expenditure, there remained a balance at the bankers of over £100. A flower service, through the kindness of the chaplain (the Rev. F. Umpleby), was held at Osballdwick Church in July, and a collection, amounting to £10, was made in aid of the Gardeners' Orphan Fund.

Obituary.

JOHN DUKE.—By the death of John Duke, which took place at 61, Canongate, Edinburgh, on the 6th inst, at the age of 75 years, a figure familiar in the nursery trade of Edinburgh for many years, and to numerous readers of the *Gardeners' Chronicle*, has been removed. Mr. Duke began his career as a nurseryman in nurseries in the south of Scotland, removing, after some time, to Edinburgh, where he served first the late Mr. Cunningham (now Cunningham & Fraser), of Comely Bank Nursery. He was, however, best known in connection with the firm of Messrs. Peter Lawson & Son (latterly the Lawson Seed and Nursery Company, Limited), which he served between thirty and forty years. His knowledge of nursery stock, particularly of hardy shrubs and trees, and fruit trees was very comprehensive, and of such kinds of nursery stock he was recognised as being a very capable valuer. He retired from active work about the year 1885.

LAW NOTES.

PROSECUTION OF A COMMISSION SALESMAN.

On Thursday last, Frederick Wise, described as a commission salesman, was charged at Bow Street Police Court with obtaining goods under false pretences. Mr. Wolvorton (with whom was Mr. J. P. Grain), instructed by Mr. C. Butcher, Solicitor for the Nursery and Seed Trade Association, appeared to prosecute, and said the prisoner had held himself out to be a commission salesman, having a stall, No. 390, in the Wholesale Flower Market, Covent Garden, although he had no stall whatever in the market, and on the faith of such representation, it was alleged growers of produce had sent goods to him which he had sold, and had not accounted for the proceeds. Counsel stated that he would only call sufficient evidence to justify a remand. He called Mr. Cook, gardener to Major Henneage, of Compton Bassett, Wilts, and Mr. Theodore Jannoch, of Dorsingham, Norfolk, who proved having sent goods to the prisoner on the faith of his representation, and the case was then adjourned till Thursday next. As this is a case of much importance to the trade, and is taken up on public grounds, it is hoped that others who have sent goods under similar circumstances will communicate with the Nursery and Seed Trade Association.

CHISWICK GARDENERS' ASSOCIATION. Next Friday evening, January 21, Mr. W. SWAN, Castle Hill Garden, Englefield Green, Staines, will lecture to the members of this Association, dealing with Crocuses and their cultivation.

MARKETS.

COVENT GARDEN, January 16.

[We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who are the best authorities on the responsible quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as the list, and the particular prices at any particular date, and still less be taken as guides to the prices in the coming week. Ed.]

BUSINESS VERY dull, and prices of imported goods much lower. Grapes realising better values. James Webber, Wholesale Apple Market.

CORN.

Averages.—Official statement showing the average price of British corn, imperial measure (quarts) for the week ending January 11.—Wheat, 30s. 1d.; Barley, 31s. 3d.; Oats, 18s. 1d. For the corresponding period last year:—Wheat, 30s. 2d.; Barley, 25s. 3d.; Oats, 16s. 6d.

SEEDS.

LONDON, Jan. 15.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, state that the inquiry for farm seeds is now increasing. Choice parcels of English red Clover are scarce, and command higher figures; secondary qualities remain unchanged. Trefoil, white Clover, and Alsike, keep

steadily. Rye-grasses neglected. There is a more active demand for winter Tares. Blue Peas sell at full prices, though trade is not brisk. Haricots are still remarkably low.

FRUITS AND VEGETABLES.

SUITABLES. Jan. 15.—Supplies continue plentiful, but the demand very slow. The following were the quotations:—Cauliflowers, 1s. 6d. to 2s. 6d., per dozen; Savoy, 2s. to 3s. 6d., per tally; Cabbages, 1s. 6d. to 2s. do.; Curley Kale, 1s. per bushel; Seakale, 1s. to 1s. 6d., per punnet; Spinach, 1s. to 1s. 6d., per bushel; Sprouts, 9d. to 1s. 6d., per half sieve; Turnip-tops, 1s. 6d. to 2s. 6d., per sack; Greens, 1s. to 1s. 6d., per dozen bunches; Turnips, 2s. to 3s. do.; Carrots, 1s. 6d. to 2s. do.; Parsley, 1s. to 2s. do.; Celery, 4s. to 11s. per dozen bundles; Horseradish, 1s. to 1s. 3d., per bundle; Parsnips, 1d. to 6d., per score; Beetroots, 3d. to 1d., per dozen; Eodive, 1s. to 1s. 6d. do.; Mustard and Cress, 1s. to 2s. per dozen baskets; Leeks, 1s. to 1s. 6d., per dozen; Spanish Onions, 6s. to 7s. 6d., per case; English do., 7s. to 8s. 6d., per cwt.; Bordeaux do., 6s. to 7s. per case; Belgian do., 5s. to 6s., per bag of 110 lbs.; Dutch do., 5s. 3d. to 6s. do.; forced Rhubarb, 1s. to 1s. 6d., per dozen bundles; English Apples, 3s. to 7s., per bushel; American do., 10s. to 10s., per barrel.

SUITABLES. Jan. 11.—Greens, 1s. 6d. to 2s. 6d., loose; Carrots (cattle feeding), 18s. to 25s., per ton; Mangels, 15s. to 20s., do.; Swedes, 17s. to 20s., do.; Apples, English, 2s. to 7s., per bushel; Sprouts, 1s. to 2s., per half-sieve; Onions, 7s. 6d., per case; Oranges, 8s. 6d. to 14s. do., Beetroot, 8d. to 1s., per dozen; Parsnips, 10d. to 1s., per score; Carrots, 2s. 6d., per dozen bunches; Rhubarb, 1s. 6d. to 2s. 6d., do.; Radish, 1s. do.; horseradish, 1s. 6d., per bundle, dates, 12s., per cwt.

POTATOS.

SUITABLES. Jan. 11. Supplies large, with drooping prices.—Regents, 4s. to 5s.; Hebrons, 4s. to 40s.; Magnum Bonums, 40s. to 35s.; Imperators, 4s. to 75s., per ton.

SUITABLES. Jan. 15.—Quotations: Early Rose, 40s. to 60s.; Magnums, 45s. to 65s.; Regents, 50s. to 70s.; Chammions, 50s. to 55s.; Imperators, 50s. to 70s.; Hebrons, 50s. to 60s., per ton.

SUITABLES. Jan. 11.—Quotations:—Magnums, 40s. to 60s.; do., dark, 40s. to 50s.; Scotch do., 60s. to 80s.; Regents, 60s. to 70s., per ton.

HAY.

Averages.—The following are the averages of the prices at the various metropolitan markets during the past week:—Clover, prime, 28s. to 29s.; inferior, 16s. to 25s. Best hay, 60s. to 92s.; inferior, 25s. to 30s. Straw, 28s. to 40s., per load.

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending January 11, is furnished from the Meteorological Office:—

The weather has continued cloudy or dull very generally, with frequent falls of rain. In many parts of England, however, some fine, bright intervals were experienced. Soon after the commencement of the week severe thunderstorms occurred in many parts of Ireland and Scotland.

The temperature has been much above the mean in all districts. Over Ireland and the greater part of Scotland, the excess has been 5° or 6°, and over the western parts of England and Scotland 7°, while over southern, central, eastern, and north-eastern England, the excess has been as much as 8° or 9°. The highest of the maxima were registered in most places either on the 6th or 7th, when the thermometer rose to between 52° and 55° over Scotland, and to between 51° and 52° in Ireland, while over England they ranged from 55° to 58°. The lowest of the minima, which were recorded either on the 5th or 11th, ranged from 29° in Scotland, N., and 29° in England, N.E., to 36° in Scotland, W., and England, N.W., and to 44° in the Channel Islands. During the greater part of the week, the minima at many of the English stations were but little below 50°.

"The rainfall has been rather less than the mean in nearly all of the English districts, but considerably more over Ireland and Scotland, as well as in 'England, N.W.'"

"Bright sunshine has continued very deficient generally, the percentage of the possible amount of duration having ranged from 3 in 'England, N.E.' to 17 in 'England, S.' and 'Ireland, N.' and to 21 in the 'Channel Islands.'"

[By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the direction, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees as "Day-degrees" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns: DISTRICTS, TEMPERATURE (ACCUMULATED), RAINFALL, BRIGHT SUN. Rows list districts like 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12 with corresponding data.

The districts indicated by number in the first column are the following:— Principal Wheat-producing Districts — 1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S. Principal Growing Vcs. Districts — 7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

ENQUIRIES.

"He that questioneth much shall learn much." — BACON. Can any reader oblige by informing me of the name of the subjoined lines, and their place and publication?

Come, let us go into the lane, love mine, And mark and gather what the autumn grows; The creamy Elder mellowed into wine, The russet hip which was the pink-white Rose; The amber Woodbine into rubies turned, The Blackberry that was the Bramble born; Nor let the seeded Clematis be spurned, Nor pearls, that now are corals, of the Thorn. Look! what a lovely posy we have made From the wild garden of the waning year— So when, dear love, your summer is decayed, Beanty more touching than is clustered here Will linger in your life, and I shall cling Closely as now, nor ask if it be spring. A.

Where can I get seeds of Linnophila heterophylla, L. racemosa, and L. gratioloides? G.

NOTICES TO CORRESPONDENTS.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

ACIANTUM FARLEYENSE: An Old Subscriber. Pot the plant in early spring, using peat, a little loam, and

leaf-mould, and through the whole distribute nodules of sandstone of the size of a walnut and added, a fair amount of coarse sand must be added to make the mass quite permeable to water. The drainage must be good if the plant be in a pot, but less is needed if a pan be used. Place in the intermediate house, and not at the warmest part, and where it may be shaded during bright sunshine. Water the soil before it gets very dry; and do not syringe or water overhead, or afford water by means of a rose, but let the water run on to the soil, at a point distant from the root-stock. Give the plant less water after September, and keep it moderately dry in the resting period, that is, during the late autumn and winter months. If the plant be stood over a pan of water a few inches above the surface, it will be benefited in summer the more. When it has grown to a large size, the centre berries starved, and compressed by the surrounding crowns; and it is better then if broken up in three or four pieces, or the centre may be cut clean out with a long knife and refilled with soil. It is an evergreen, and is therefore not improved by having its fronds mown over, but the aged fronds, which by the way are frilled and are unfertile, may be removed as fast as they become dingy. The farther the plant stands from the light the longer will the stipes be.

BADLY COLOURED GRAPES: A. P.—Overcropping this year certainly and perhaps in previous years, is the cause of the Vines growing but little, and having red berries. The evil has been somewhat aggravated by shading, and the flavour has suffered from that cause. Do not let more than a dozen bunches grow next year, thin early the bunches and berries. Use Thompson's vine manure on the surface of the border, and do not mulch; you do not need it at Birmingham.

BOOKS: A. B.—The Kew Bulletin is published by Messrs. Spottiswoode & Sons, Queen's printers.

CLAY AND ROSES. J. P. The Rose has a partiality for a stiff soil, provided it be well drained. Therefore, the practice you mention as being advocated by an F. R. H. S. is a good one in soils that are sandy or otherwise of a light nature; but it is better when the clay is chopped up with a spade, and mixed with the staple. Take care that the soil is made very firm under the Roses before planting, and round about after planting them; but do not trample it if it be wet, rather leave it till it is dryish, and does not stick to the shoes. Do not put the clay immediately about the roots at planting, but for that purpose use sifted leaf mould and potting bench refuse.

CORRECTION: The last two lines of Mr. Fish's article on "The Time to Plant Roses" in our issue for January 4, p. 11, should run thus:—"That Roses planted before or in November must succeed—planted afterwards, they may."

COUNCIL OF THE ROYAL HORTICULTURAL SOCIETY: S. Yes; any two Fellows have the right to recommend persons for election into the Council, or to fill any of the principal offices, provided that they give written notice on or before the 10th day of January. If you have not already done so, you are too late for this year, as you cannot vote for any other persons than those then submitted to you at the annual meeting.

GARDEN ACCOUNTS. A. G. We cannot inform you of the particular number in which the article appeared; and seeking for it in our already numerous volumes, would be, in time alone, a costly affair.

GROS COLMAR AND LADY DOWN VINES: Old Subscriber. Both will grow well together in the same house. In the absence of particulars of management, we cannot say to what cause the failure to colour may be due. We think you have much to learn in the matter of growing grapes. Send particulars.

HYACINTHS: G. H. The appearance is not uncommon, and apparently arises from the want of a proper balance of growth between the outer scales and the base of the flower-spike. The outer scales are thick and turgid, and do not separate one from another sufficiently freely to give room to the spike; the consequence is, the rapidly-growing flower-spike is pinched and, as it were, throttled, and ultimately breaks off.

NAMES OF PLANTS: A. C. Chimonanthus fragrans.—T. C. Cocoloba platycladon.—F. S. Panicum

variegatum, the Cyperus next week.—W. H. H. Probably Spirea Lindleyana, but the scrap is insufficient.—Constant Reader. We cannot name florists' flowers.—H. J. P. Oncidium ornithorhynchum. The Dracena has probably been over-fed. Such variegated plants frequently die off in the same way as yours have done.—J. W. J. Eucalyptus globulus; 2, Begonia Ingrami; Libonia floribunda; 4, Echeveria retusa glauca (probably).—Aireville. Asplenium marimum.

ONTOGLOSSEM ROSSI VAR.: W. H. Stephens. Varieties similar to yours have appeared lately in some few collections. It is not common.

SPRING BUDDING: A. P. Yes, the budding would be done with mature, plump buds, cut from last season's growth. It is in reality bud grafting, and there must be the same union at the edges of the inner bark of stock and scion as with ordinary grafts. The bud may be oblong, square, or round, and must retain the wood at the back. It is not to be inserted in a slit like an autumn bud.

DIED.—We regret to announce the death, on January 3 last, of Enoch White, aged fifty-nine years, a much-respected nurseryman of Bourne-mouth, Dorsetshire.

VARIORUM.

PODOCARPUS DACRYDIODES. A. RICHARD (THE KAHIKATEA).—The Kahikatea or "White Pine" of the timber merchants is a noble tree, often forming dense forests in swampy districts, although by no means infrequent in dry or hilly situations below 1,500 feet. It was originally discovered by Captain Cook in the great forest between the Thames and Piako Rivers: a tree measured by him was found to be 19 feet 8 inches in circumference at 6 feet from the ground, and 89 feet to the first branch. He states, "It was straight as an arrow, and tapered but little in proportion to its height; so I judged there were 356 cubic feet of solid timber in it, exclusive of the branches. As we advanced we saw many others that were still larger." The forest in which it was first discovered is probably the largest Kahikatea forest in the colony, and I am informed by Mr. Bagnall, of the Turna Sawmills, that he has discovered a tree which he believes to be the one actually measured by Cook. T. Kirk, in "Forest Flora of New Zealand."

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood Lice, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.
 SAFE—ECONOMICAL—EFFECTUAL.

15, PRINCES STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were good to send me at the rate of 1 oz. to a gallon of water at a temperature of 95°, I find it kills Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts, in a few seconds, in destroying Mealy Bug and other insects, especially Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and it is withal a most agreeable compound to work with. All our insect remedies severer test of efficiency than when applied by hand-washing or spray.—I remain, dear Sirs, yours truly. (Signed) A. MACKENZIE, Victoria and Paradise Nurseries, Upper Holloway, London, January 7, 1888. "GENTLEMEN—I have given your Insecticide, "Picrena," a good trial in competition with many others. I am pleased to say that I have found it to be more effective in destroying Mealy Bug and other insects than anything we have ever used. It ought to command a good sale. (Signed) B. S. WILLIAMS."

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each; in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by **DUNCAN, FLOCKHART & CO. Chemists to the Queen, Edinburgh.**

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from **WILLIAM EDWARDS and SON, 157, Queen Victoria Street, London.**

"Nothing Succeeds like Success."

HUGHES' (SOLUBLE) INSECTICIDE
FIR TREE OIL

FLORISTS and NURSERYMEN SHOULD NOT BE WITHOUT IT.
Dog and Bird Fanciers should all use it.
Houswives should use it as a Disinfectant, Bleacher, and Cleanser when washing Under Linen.
 Sold by Seedsmen and Chemists, 1s. 6d., 2s. 6d., & 4s. 6d.; 1 gallon 12s. 6d., or less in larger quantities.
 A Treatise on **FIR TREE OIL** as an **INSECTICIDE**, its application to Plants and Animals, sent Post free on receipt of application, addressed to

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates. Apply for terms.

SPECIMEN FREE. Price 2d.

Published Friday for Saturday.

Agents for Great Britain and Ireland —

STEEL AND JONES, 4, Spring Gardens, Charing Cross, London, S.W., to whom Orders for Advertisements and Subscriptions may be sent. A Specimen Copy post-free for Jrd. (stamps).

WANTED.—ADVERTISER desires to meet with an intelligent and well-informed Gentleman of about twenty-five years of age, of industrious, energetic, and persevering habits, experienced in Nursery Management (principally outdoor), to assist him in the development of a Nursery Business in the South, doing a local as well as a wide-spread trade. In the event of his meeting with a suitable person, an arrangement with a view to partnership might be entertained, but in no case would high wages be given at starting. First-class references required.—Apply, by letter, with full particulars, to E. H. B. Box, Smith's Advertising Agency, 352, Fleet Street, London, E.C.

WANTED, NURSERY MANAGER, indoors and out; thoroughly practical, good Manager of Men; one used to Market Nurseries preferred. State age, wage, and experience.—BRETS, BARKER & CO., Barton-on-Trent.

Jephson Gardens, Leamington. HEAD GARDENER WANTED.—THE COMMITTEE are PREPARED TO RECEIVE APPLICATIONS for the office of HEAD GARDENER, the duties to commence on the 31st day of March next. Applicants must be married, the wife having to take charge of the Lodge and adjoining Gates, and the number and ages of children are required. Salary, £70 per annum, with House (the Lodge), Coals, and Gas.—Applications, with original Testimonials (which will be returned), to be sent on or before the 15th day of February next, to WILLIAM MAYCOCK, Secretary, The Parade Lodge, Jephson Gardens, Leamington, January 8, 1890.

Gardener. WANTED for North Yorkshire for the end of January, an unmarried MAN under 30 years of age, as Gardener, single-handed, experienced in and out; must understand the Management and care of Poultry. Preference given to a man who has served under an experienced Head Gardener.—Address with full particulars, and stating wages required, board and lodging being found, to GARDENER, care of W. H. Smith & Co., Advertising Agents, Manchester.

WANTED, a SINGLE-HANDED GARDENER, place very retired district, of North Hants; experience as Single-handed in and out-door Work, assist with Coals, &c. Age 25 to 40; wages, 40s., and cottage.—Miss A. LUSHINGTON, Kingsley, Alton, Hants.

WANTED, a Married Couple (middle-aged), as an ASSISTANT GARDENER—good at Vines, Hot-house Plants, &c.; wife, LAUNDRESS—cottage and garden, with laundry attached.—State all particulars, F. WOLLASTON, Esq., Shenton Hall, Nuneaton.

WANTED, a SECOND GARDENER for Flower and Kitchen Garden. Wages 19s. per week with Bothy.—C. 3, Charles Terrace, King's Road, Mortlake, S.W.

WANTED, a good PROPAGATOR and GROWER of Herbaceous and Alpine Plants for a Small Nursery near London, an abstainer preferred. State age, wages, and experience, by letter to G. H., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

WANTED, an active and industrious young Man as PROPAGATOR and GROWER.—State age, wages, and particulars to W. TROUGHTON, 4 Church Street, Preston.

WANTED, an energetic pushing young man as PROPAGATOR and GROWER of Plants, principally for Cut Blooms; must be able to Grate Limes and Gravels. Wages to commence at 25s. per week; first-class references required on a good firm.—W. and J. BLOWN, Wothorp, Stourton.

REQUIRED AT ONCE, young MAN in the "B" House (Country). Must understand germinations and the growing of other soft-wooded Stuff for Cut-blooms; able to make Wreaths, &c.—Apply, stating wages, references, qualifications, and experience, in A. A., Gardeners' Chronicle Office.—Must be a Churchman. Preference given to a man who would sing in the Choir or play a band instrument.

WANTED, a strong, steady young MAN, as Third where five are kept. Wages to commence 12s. per week with Bothy, Milk, and Potatoes.—Full particulars to J. HORNER, Myton Hall, Helperry, York.

General Nursery Assistant. WANTED, in a Horticultural Nursery, an intelligent, active, and reliable MAN. Must possess a practical knowledge of Budding, Grafting, and Pruning. Preference given to one who has a knowledge of the Seed Business. Applicants to state in writing their experience, age, and salary required.—S. H., Messrs. Hurst & Sons, 182, Houndsditch, London, E.

WANTED, a young MAN, as ASSISTANT in the House. One who has been in a Market Nursery preferred.—GEORGE EDWARDS, Balham Nursery, London, S.W.

WANTED AT ONCE, a YOUTH, also an APPRENTICE to First-class Florist, indoors.—Apply, NEWMAN, Florist, Bromley, Kent.

WANTED, a trustworthy, pushing young MAN, to Attend Markets, and fill up time in Nursery.—Apply, stating age, wages, and experience, J. WRIGHT, Nurtryman and Seedsmen, Granby Street, Leicester.

Seed, Bulb, and Plant Trade. WANTED, a young MAN, experienced in above branches, and capable of taking Part Management and Working up New Business.—Apply, enclosing testimonials and stating age, salary required, and other particulars, HARLEY and SONS, Covent Garden Warehouse, Dundee.

GARDENING APPOINTMENTS.

Mr. DAN LEVENHOS, until recently General Foreman at Rendcomb Park, Cirencester, has been engaged as Gardener to C. JACK, Esq., Beech Hill Park, Barnet.

Mr. THOMAS OLDFHAM, late of Malvern Hall Gardens, Solihull, Birmingham, has been engaged as Head Gardener to H. L. POWNS-KECK, Esq., Stoughton Garden, Leicester.

Mr. F. ELMES, late Head Gardener at Westfield, Edghaston, has been appointed Head Gardener to W. W. RIDDELL, Esq., Shenstone Lodge, near Lichfield.

Mr. ALEXANDER McRAE, late of Corriemony Gardens, Inverness, N.B., has been engaged as Gardener to GEORGE INGLIS, Esq., of Newmore, Invergordon, N.B.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Agents.—It is very important in remitting by Postal Order that it should be filled in payable to No. 42, BRADFORD LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it. N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

NOTICE TO ADVERTISERS.—In many instances References in Argument of Report Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish remitted.

Gardeners, Foresters, and Farm Bailiffs.

LITTLE and BALLANTYNE, The Queen's Nurserymen and Seedsmen, Carlisle, invite correspondence with Landed Proprietors, Agents, and others requiring the services of GARDENERS, FORESTERS, and FARM BAILIFFS. HANDY MAN, in a Nursery.—Good Brick-layer, Carpenter, Painter, Glazier, Hot-water Fitter, and Greenhouse Builder.—SAMUEL HILL, Florist, &c., Luttrell Road, Forest Gate, E.

HOLLOWAY'S PILLS.—Indigestion and Liver Complaints.—The digestion cannot be long or seriously disordered without the arrangement being perceptible on the condition. These Pills prevent both unpleasant consequences; they improve the appetite, and with the increase of desire for food, they invigorate the powers of digestion and assimilation in the stomach. Holloway's Pills deal most satisfactorily with deranged or diseased conditions of the many organs engaged in extracting nourishment for our bodies from our various diets—as the liver, stomach and bowels, and of which they exercise the most judiciously and carefully. By resuming it on an early stage of this malady to these purifying and laxative Pills, the dyspeptic is speedily restored to health and strength, and his salivaries gradually renewed.

HEATING! HEATING!! HEATING!!!

THE THAMES BANK IRON COMPANY,

Undertake the complete erection of **HEATING APPARATUS** for **GREENHOUSES, OFFICES, PUBLIC BUILDINGS, &c.** Have the largest stock of **BOILERS, PIPES, and CONNECTIONS** in the Trade to select from, and invite inspection of same.

A perfect Non-Conductor of heat,
keeping wherever it is applied an
even temperature.

To be obtained of all Nurserymen and Seedsmen.

NOTICE.

The words "Frigi Domo" are registered as a Trade Mark, and in two recent actions of Benjamin Edgington, Limited, Plaintiffs, v. John Edgington & Co., Defendants, and Benjamin Edgington, Limited, Plaintiffs, v. Osman & Co., Defendants, judgments have been obtained against the Defendants for a Perpetual Injunction, restraining them from using the words "Frigi Domo" as a Trade Mark for any material intended to be used for Horticultural or similar purposes not manufactured by or for the Plaintiffs or selected by them, and the Defendants, John Edgington & Co., and Osman & Co., were ordered to pay Damages and Costs.

BENJAMIN EDGINGTON

(LIMITED),

2, Duke Street,
LONDON BRIDGE, S.E.

FOR SALE, a PEACH HOUSE (lean-to), 1st feet long by 8 feet wide, glazed in putty with 3-rolled plate glass. This House is being pulled down, it having been decided to rebuild it and others on Helliwell's Patent System, which has been in use in the same garden for the past five years. The substitution of Helliwell's Patent System for old putty structures has been effected in many noblemen's and gentlemen's gardens in consequence of the saving effected in repairs, painting, &c., and also because of the greater increase of plant growth and fruit crops due to better light. Testimonial—

Shirburn Castle, Twetworth, January 5, 1890.

Sir,—As you request my opinion of the houses you erected for me some four years ago, I beg to inform you that I consider them a perfect success, and I have recommended them to many of my neighbours.

Yours truly,

(Signed) Maclesfield.

The Peach House may be seen at Kirkless Hall Gardens, Brighouse.

For prices, &c., apply to **HELLIWELL'S Patent Glazing Works, Brighouse, Yorkshire.**

Messrs. Dicksons, Limited, Chester, write:—"The Flower Pots you have so largely supplied us with are light, strong, and well made, and in every respect highly satisfactory."

Messrs. Richard Smith & Co., Worcester, write:—"We beg to say that we are highly satisfied with your 'Garden Pots'—they are well made, light, yet strong, and we like them better than any others we have ever used."

Mr. William Bull, 538, King's Road, Chelsea, London, writes:—"For nearly thirty years I have been using your 'Garden Pots,' and still find them best and cheapest."

Largest Manufacturers in the world. No waiting; millions in stock. Carriage and breakage free on £10 orders. Half carriage on £5 orders. Samples free. Address—

RICHARD SANKEY & SON, BULWELL POTTERIES, NOTTINGHAM.

ALL WHO DESIRE TO HAVE A CONSTANT and PLENTIFUL SUPPLY OF THE

BEST VEGETABLES and FLOWERS

Should procure their Plants and

SEEDS FROM SCOTLAND.

Our "AMATEUR'S GARDENING GUIDE," the most interesting and instructive Catalogue of the season, is now ready, and will be sent gratis and post-free to all applicants.

STUART & MEIN, KELSO, SCOTLAND.

HENDERS' PRIZE PETUNIAS, the finest strain in existence. Grand Double Fringed, 1s. 6d. and 3s. per packet; Single Fringed, new, saved from fine fringed flowers, 2s. per packet; Single Striped, speciality for 40 years, 1s. and 2s. per packet.

BALSAMS, Henders' Double, the finest obtainable, 8 vats, 2s. 6d., mixed, packets, 1s. Henders' CATALOGUE of first quality Seed free on application. HENDER AND SONS, Nursery, Plymouth.

Brocoli—Good Sorts not Common in the Trade. HARTLAND'S "APRIL QUEEN."—Is a sterling Novelty from South of Ireland. Certainly one of the finest in cultivation; ready for use during the months of April and May. The heads are of immense size, and the leaves, which are most abundant and peculiar in color, form such a thorough protection that the outer appearance, before being striped, is that of a "high quality" Cabbage. It has been grown locally to great perfection—some heads weighing over 14 lbs. from the very close protection—white as snow.

In sealed packets, 1s. 6d. WM. BAYLOR HARTLAND, Old Established Seed Warehouse, 24, Patrick Street, Cork. Wholesale, from HURST AND SONS, London. * * Year Book of Seeds for 1890 now ready.

THE VINEYARD AND NURSERIES, GARSTON, near LIVERPOOL.

TOMATO "PRELUDE"

At the great trial of Tomatos last year at Chiswick, where they were grown perhaps better than ever before, this variety showed its superiority from beginning to end; it produced by far the greatest crop of medium-sized lovely fruit, of delicious flavour, from the very ground up to 6 or 8 feet high, and with the least attention always sets well. It was over and over again pronounced by the best judges in the world the freest and most profitable Tomato of all by a long way; it also proved unmistakably the best in our 100 foot trial house, and the same report reaches us from all parts of the world. A real gold mine to market growers.

Awarded First-class Certificate by the Royal Horticultural Society.

1s. 6d. per packet.

For Illustrations see our SEED CATALOGUE, of the greatest value to all possessing a Garden.

PERFECT SEEDS DIRECT ONLY from

DICKSONS NURSERIES, CHESTER.

HENRY CANNELL & SON'S NEW VEGETABLES.

WE WISH TO DRAW THE PARTICULAR ATTENTION OF THE WHOLE Horticultural World to this splendid kind, Mr. LYE, who is well-known as one of our greatest raisers, connoisseurs, and prize-takers, determined to produce a POTATO combining all the merits necessary in one variety, to render it perfect or nearly so, and after many years exertions, numerous seedlings, and immense labour, he, in his opinion, has at last attained his object, and hence named it "VICTORY." As further and greater proof, it was exhibited uncooked and cooked at the great Vegetable Congress, at Chiswick, and was unanimously awarded a First-class Certificate by the most select Judges in the World; this being so, it may safely be said that it is the most invaluable POTATO ever offered to the Public—not only is it handsome, but its edible qualities and productiveness, and disease resisting powers are surprising; it will be sought after on all sides, as soon as its value becomes known. 1s. per lb., 12s. per peck. For other New Vegetables, send for our CATALOGUE.

GOLD MEDAL.

Quite the most original CATALOGUE in the Trade, Terms and Prices certainly the best. Post-free to every applicant.

Every Gardener should see this list, because a number of exceedingly good things can only be had from us. We are urgently indeed press gardeners to write for this list.

The New Japanese Primulas, the most startlingly remarkable flowers ever raised in this group. Destined to be as generally known as Primula sinensis. Most highly praised by every horticultural paper, and by the Times and London Press. Three Medals in three weeks. These are of such very special character, and will be so much talked of this spring, that every lover of these flowers should see a full account of them in Catalogue.

Gold Medal for Tuberos Begonias. — The cheapest in the Trade. Every lover of good Begonias should see our list. We have been delightfully successful, and our strain is grand beyond all description.

Seeds that Give Satisfaction. — Our great strength as a seed firm, and the cause of the extraordinary growth of our business, is the splendid quality of our strains of flowers, and the front rank reputation we have for Exhibition Vegetables.

£50 in Prizes and Two Medals are offered by us to our customers only, on so ingenious a plan that all can compete on fair and equal terms, wherever they may reside. All who can grow things well should see our Catalogue.

The best proof of our confidence that our terms and prices are of the best is that we send our Grand, Illustrated, Post-free, Full Cultural note CATALOGUE, Post-free to every applicant.

RYDER & SON, SEED MERCHANTS, SALE, MANCHESTER.

Important to Everyone Interested in Gardening.

THE ILLUSTRATED GUIDE FOR AMATEUR GARDENERS, SPRING, 1890.

This superb work, enclosed in a charmingly printed Coloured Wrapper, contains 132 pages, imperial size, of beautifully printed letter-press, and upwards of 170 fine Wood Engravings, 2 splendidly finished Coloured Plates, original articles on the Rearing of Flowers from Seed and Culture of Garden Crops, a fine and Select List of Choice Kitchen Garden and Flower Seeds, Seed Potatoes, Flower Plants, Lilies, Gladioli, Roses, &c., and all the Important Novelties of the Season. This will be found incomparably the best and most comprehensive Garden Catalogue yet set out.

WEBBS' SONS, WORDSWORTH ROAD, LONDON, E.C. 4.

EAST LOTHIAN STOCKS A SPECIALTY.

True strains and extra fine varieties in the following: Purple, Scarlet, White, Crimson, & White. Willow-leaved, & all colour. 12, 24, 48, 96 per packet.

Mr. G. A. The Gardens, Hinton Park, writes: "I have used many packets of East Lothian Stocks. I must say that your strains of East Lothian Stocks are the finest I have ever seen. When I was at Wemyss the beds of East Lothian Stocks supplied by you were only first class, and you were so good. We had upwards of six feet of double flowers."

Mr. B. H. The Gardens, Hinton Park, writes: "The East Lothian Stocks from you were excellent. The white, purple and crimson exceptionally true. Many spikes were over 18 in. long and densely clothed with bloom."

Mr. L. S. The Gardens, Hinton Park, writes: "I have used four packets of East Lothian Stocks. This year I have the finest I ever had. They are the admiration of every one who sees them. The whites are over 100 per cent. double, which could not be better."

All other seeds of the same first class quality only, notably the following, all saved from my own world-renowned collections:

- PANSIES, show and fancy, 1s., 2s., 4d., and 5s. per packet.
- PENSTEMONS, 1s. and 2s. 6d. per packet.
- ANEMONES, 1s., 2s., 4d., and 5s. per packet.
- MIMULUS, 1s. and 2s. 6d. per packet.
- ALICE'S, 1s. and 2s. 6d. per packet.
- STAGS, 2s. 6d. and 5s. per packet.
- HELM'S, each colour 1s. and 2s. 6d. per packet.
- CINERARIA, 1s. and 2s. 6d. per packet.
- COCKSCOMB, extra large and compact strains, 2s. 6d. per packet.
- BROUSSIERS, Single, 1s. and 2s. 6d. per packet.

Mr. A. S. The Gardens, Hinton Park, writes: "I will be pleased to hear that your seeds have done well. I have not my complete list."

CATALOGUE for 1890, and post free on application.

JOHN FORBES, NURSERYMAN, HAWICK, SCOTLAND

NOVELTIES OFFERED BY HERM. A. HESSE, NURSERYMAN, WEENER (HANOVER), GERMANY.

The Novelties enumerated below are raised from Seed in my Nurseries, and are now offered to the Trade for the first time.

JUNIPERUS VIRGINIANA AUREO SPICA (Hesse).

A beautiful plant, which was found in my nurseries among seedlings of the Virginiana variety. The terminal shoots of this beautiful plant are in spring of a brilliant golden-bronze, whereas the older leaves are of a beautiful green. The colour is much heightened by full exposure to the sun. We obtain from this brilliant gold tint in my plant.

Price per plant, 6s. 6d. per 100, 12s. 6d. per 1000.

ACER PLATANOIDES FOLIIS ELEGANTER VARIEGATIS (Hesse).

A remarkable fine, very interesting, most striking, and very distinct variety of the Norway Maple, raised from seed in my nurseries several years ago, and much admired by visitors. On first appearing, the leaves are nearly white. Afterwards most of the leaves are marked with a regular white pattern. Here and there we find some leaves all white, or half white and half green, but all are perfectly developed, and a very important feature, that they never suffer from the heat of the sun, as do the generally trees having variegated foliage. They preserve their beautiful markings unaltered till autumn. It is a beautiful tree to be valuable for producing decorative effects in pleasure gardens.

Price per plant, 6s. 6d. per 100, 12s. 6d. per 1000.

THUJA OCCIDENTALIS WARREANA LUTESCENS (Hesse).

A very fine variety of Thuja Warreana, of compact growth, grown here and introduced into commerce by me some years ago. The leaves are alternately of a shining light yellow and of a darker yellow tint. It has all the superior qualities of Thuja Warreana, and its seeds have been chosen for that purpose. Mr. Bessner, Inspector of the gardens at Bonn, writes on the subject: "This is one of the most beautiful and most striking forms of Thuja. It is very distinct and very effective form. Through extensive culture in pots or groups, it is not yet much known, but its characteristics are very valuable and not worth cultivating are not to be forgotten."

Price per plant, 6s. 6d. per 100, 12s. 6d. per 1000.

ABIES AMABILIS (Forbes).

A fine and very hardy tree, first introduced by Douglas in 1831 from Oregon territories, but which, strange to say, was not cultivated, and has remained entirely unknown. Only seven years ago I succeeded in raising seeds from its native country, which, despite of a few efforts, I obtained only one young tree. In nurseries we seldom find it genuine. What we receive under this name from Holland or from France is mostly A. magnifica (Murray & Gordon). In its young state it resembles A. balsamea, but its cones have been mistaken for that species. The leaves are longer than those of A. nobilis, straight, glossy, green above, with a dark line along the middle, and with two broad glaucous lines on the sides. Very striking and pleasing through an assortment of leafy or decumbent branches, and the peculiar deep blue-green of its foliage.

Price per plant, 6s. 6d. per 100, 12s. 6d. per 1000.

PICEA OMORICA (Pancic).

Mr. Pancic found this remarkable and fast growing spruce in Servia. It has very long and almost pointed and prickly leaves, white underneath. When these trees are young, the leaves turn, as is the case with all the Fir trees of this group, so as to show at the same time their white and green sides. This is a very interesting and different species, and deserves to be much propagated. (See illustration in *Gardener's Chronicle*, March, 1884, p. 239.)

Plants on one packet, 6s. 6d. per 100, 12s. 6d. per 1000.

PSEUDO-LARIX KÄMPFERI.

Price per plant, 6s. 6d. per 100, 12s. 6d. per 1000.

WHOLESALE CATALOGUES can be had on application.

As a Supplement TO THE GARDENERS' CHRONICLE FOR Next Week, February 1, WILL BE Published an Ink Photograph OF THE TERRACE GARDEN, RICHMOND.

THE Gardeners' Chronicle.

SATURDAY, JANUARY 25, 1890.

THE FLOWER TRADE IN SCOTLAND.

THERE are few more interesting phases in the market gardening of to-day than the rapid growth of the trade in flowers. What were regarded half a century or so ago as perfectly superfluous luxuries, are now looked upon as essentials without which life itself would be hardly bearable. Other luxuries, and, perhaps, also certain necessities, have suffered in consequence of the present rage for flowers, for the rise of one industry is invariably made at the expense of another, and its consumption frequently marks the decadence of several more. The inception and growth of the flower-trade in the Scilly Isles, however, was the effect rather than the cause of a great and sudden decline in Potato-growing; and as the public mind grows upon what it feeds, so the Scilly trade has fostered and encouraged a wide-spread emulation for flowers as decorative agents.

There are many still living at Scilly—not very old men either—who remember the time when farming began to prove unremunerative, and resulted in a state of chronic semi-starvation. Luckily, market gardening stepped in, and for many years proved exceedingly lucrative. But long before the cultivation of vegetables for the markets began to decline before, indeed, any such catastrophe was dreamed of; in fact, late in the sixties, Mr. Augustus Smith, the late landed proprietor, advocated the growing of flowers for market purposes. He set the ball rolling by sending off to market a few baskets of Soleil d'Or Narcissus, which were growing in a semi-wild state in the hedges. The result appears to have been satisfactory; and after a time Mr. Richard Mumford, of Holy Vale, and Mr. Trevillick, of Rocky Hill, were induced to follow his example. For some years, however, the industry made very little headway, and as a matter of fact, its rise

and its prosperous ramifications may be confined to the span of years between 1879 and 1889. It was in or about the former date that importation of bulbs was effected to any considerable extent; before this, the growers had relied chiefly upon their home supply of roots, and this brings me to a most interesting point.

From time immemorial half-a-dozen distinct varieties of *Narcissus* have been established in various parts of the islands. These include *Soleil d'Or*, *Grand Monarque*, gloriously, *Pheasant's Eye*, biflorus, the common yellow *Daffodil*, and the variety named, I believe by Mr. Barr, *Seilly-White*, which is peculiar to Seilly. Whether any or all of these varieties are indigenous is another question into which I am scarcely qualified to enter. No one seems to have any definite idea as to whence these varieties came, supposing them to be aliens. But it has been suggested that, at least, one sort—the *Soleil d'Or*—was introduced by soldiers' wives, when, in times gone by, it was necessary to fortify the "English *Hesperides*." This variety, with *Grand Monarque* and biflorus, appear to have been found round about the garrison, and not, like some of the others, in more remote quarters of the island. The other varieties grew with the greatest abundance in certain orchards, the *Seilly Whites* flourishing with extraordinary vigour at Newford; whilst the common *Daffodil* appears to have made itself quite at home everywhere, especially in marshy spots.

It is related with much gusto—by those who were not over-reached—how one or two shrewd individuals generously offered to cart away the *Narcissus* rubbish, which was beginning to be a serious nuisance; the unsuspecting portion of the Scillonian public—or, in other words, nearly everybody who had any quantity of roots—fell into this ingenious little trap. By-and-by it came out that the philanthropic weed-exterminators did not require the offensive bulbs merely to make "the front garden look gay," and that their motives were very much more than sentimental. And great was the lamentation among those who had obliged their neighbours, and deprived themselves of a veritable goldmine! Of course, if the scheme had proved a complete failure, the laugh would have been quite on the other side, but it was not.

I remember very well, some eight or nine years ago, when the first importation of any considerable bulk was obtained and sent over by Mr. J. G. Mitchinson, then of Penzance, but now of Christ Church, New Zealand. It was then thought that the Scillonians were doing a rash thing, but so long as they were willing to pay for making experiments, no one could raise objections. Still, only three or four growers ventured upon this new departure. The more conservative argued that they would stick to Potatoes, which could be eaten by themselves and by their cattle if there was no market for them; whereas, neither the flowers nor the roots of *Narcissus* could be utilised as substitutes for Potatoes.

As time went on, and as foreign competition played havoc with the *Seilly* Potato growers, the new order of things opened up a prospect of better times and handsomer profits. Now, everybody grows *Narcissus*; even children grow them—not for pleasure, but for profit—and discuss the respective merits of *Grand Monarque* and biflorus with a glibness, and pronounce the unfamiliar names with a fluency strong enough almost to make Gerarde and Parkinson turn in their graves. Men and women who can scarcely read, or who, like Tony Lumpkin, may know an

M, a T, and an S—"but whether the next be an IZARD, or an R, confound me, I cannot tell"—but not much more, pronounce the names with great accuracy. It would, perhaps, be hyperbole to state that St. Mary's is covered with *Narcissus*; but it is no exaggeration to say, that you cannot go half-a-dozen yards in the island without seeing some. They are to be seen on every side—from the acres of the wealthy cultivator to the three or four pots on the window-sills of the humblest cottage. The sight from November to May would be absolutely beyond description, were it not for the fact that the spikes are cut off before they are actually in bloom. As it is, the flower "that comes before the swallow dares" is more or less *evidence*, and in blossom for six months out of twelve.

So long as the demand for *Narcissus* lasts—and there is no indication of an abatement—an acre or two of land planted out with this bulb must prove exceedingly lucrative; but the initial cost is something appalling. One acre will easily swallow up nearly half a million roots, and these are sold at 40s. per 1000. This great expense has deterred, and still deters, many people on the "off" islands from entering largely into the fray. But when once established, the subsequent costs are merely nominal, and chiefly consist in keeping down weeds. Almost the only manure given consists of road-scrappings; but the best nourishment of all is the natural one afforded by their decaying leaves. Mr. J. C. Tonkin informs me that no strong manure should on any account be given at the time of planting. The roots are placed at from 2 to 4 inches deep in the soil, according to taste, and each has a space of about 6 square inches allotted it. The rows are separated into beds, which, during winter, are earthed-up with earth from the paths, and this top-dressing is drawn down again in early spring. The different varieties—even the forms which spring from one common type—are by no means amenable to an identical course of cultivation. Some do best with any amount of exposure, whilst others require the shade and protection of orchards or shrubberies. The origin and habitat of each new variety cannot be too closely studied and followed in the case of new varieties, and disaster besides disappointment will be the lot of those who neglect these points. If the first cost of a plantation of *Narcissus* is expensive, it has its counter-advantage in the fact that the bulbs increase with great rapidity. At Seilly, the bulb-grounds are dug up every three years, by which period each root has produced three or four flowering replicas, so to speak. These are separated, dried, and planted singly, as were the parent bulbs, early in the autumn; so that, in three years, the grower's stock will have increased at least threefold, without any material outlay. So far as the importation of *Narcissus* from Holland is concerned, it may be regarded as doomed. Many of those who supplied the Scillonians with roots now obtain their supply thence, the bulbs being quite equal to the foreign in quality and size, and considerably cheaper in price. As yet the export trade at Seilly is in its embryo, but the possibilities in this direction are vast. There are nearly one hundred acres devoted to the culture of *Narcissus*, and the capital therein invested is computed at something like £250,000. The Lord Proprietor, Mr. Dorrien-Smith, has also entered into this phase of market-gardening with enthusiasm, and he has at Tresco over 15 acres devoted to *Narcissus*; indeed, with him the subject is one of great importance, for just as he has a faria bailiff and a head gardener, so he has a head *Narcissus* grower. I am informed that

Mr. Dorrien-Smith has every known variety either on trial or in cultivation; but how far this statement is correct I am unable to say; the boisterous weather of mid-December quite preventing me crossing from St. Mary's to Tresco.

One of the most remarkable facts in connection with the *Narcissus* industry, is the manner in which the combined elements of wind and rain are defied. In spite of admirable fences of *Eunonymus* and *Escallonia macrantha*, the wind will penetrate everywhere, and it has, in times gone by, played sad havoc with the flowers, destroying thousands of spikes in one night. To obviate this, therefore, a most ingenious scheme has been hit on: so soon as the buds commence to burst, and just show the colour of the perianth, the spikes are carefully cut off and taken indoors, where they are slightly forced by being placed in shallow pans or other utensils of warm water. The perfection of the flower is by this process not only secured, but the opening thereof is hastened by many hours, nay, even by a day or two. The "keeping" qualities do not appear to be in the least interfered with, whilst the advantages are obviously great.

The correspondents have almost given up reporting the quantities of flowers exported, and certainly to those who only know Seilly under the old *regime* may be pardoned for being astonished at the figures which are published now and then in the local papers. In 1885, about 5000 packages were sent to the principal English and Scotch markets, but since then the quantity has probably nearly trebled. The largest consignment despatched by one man numbered over 500,000 spikes of *Narcissus*; but perhaps a still more concrete idea of the immensity of the trade in flowers at Seilly may be obtained, when it is stated that during the season 10 and even sometimes 15 tons of cut blooms are sent to market *via* Penzance at a time. This, of course, includes various other flowers besides *Narcissus*.

The newer or choicer and more expensive sorts of *Narcissus* are being gradually included among the collection at Seilly. Those which have so far proved best are *Ajax*, *Barrii* conspicuus, *Barbidgei*, *Emperor*, *Empress*, *Cynosure*, *Horsfieldi*, *maximus*, *Orange Phoenix*, *Princess Mary*, *Leedsii* *amabilis*, *Ruglobus*, *Sir Watkin*. Some of these may be had for a few pence each, whilst perhaps the fancy price is reached with *Barrii* conspicuus, which is a mere trifle of a guinea per bulb. The Scillonians have learned from experience that there are two ways of sending flowers to market—the right and the wrong. Baskets and boxes with their contents all sizes and sevens, and the flowers in complicated tangles, will not pay the cost of transit. Order and neatness are half the battle. The spikes are tied in dozens, and packed very tightly in boxes. The work of preparing *Narcissus* for the market is exceedingly simple, and offers a distinct contrast to that involved by *Wallflowers*, which have to be trimmed of their lower leaves and deprived of superfluous stems. In the height of the season every grower's house is literally choked with flowers, and the odours of *Daffodils* and *Wallflowers* not coalescing well, produce a combination of smell which, unlike the taste of a certain *Cocoa*, is neither grateful nor comforting. The "returns" show a sliding scale of considerable extremes, a bunch sometimes fetching three pence, and at others three shillings.

So far as we are here concerned, the *Narcissus* forms the most important branch of the *Seilly* flower trade, but there are one or two other aspects which we cannot overlook, although

our glance at them must be brief. In point of importance and quantity grown, Wallflowers take precedence. Here the initial cost is trivial, and the after-expense very small indeed. "Walls," as they are briefly called by the Scillonians, grow almost anywhere, and have hitherto yielded very good returns. They have the additional advantages of travelling well, and "keeping" good for many days.

The most recent "sensation" in the way of innovation at Scilly is the popularity of *Anemone fulgens*, which, with its very brilliant scarlet-crimson flowers, is a beautiful midwinter plant. I saw some scores in bloom a few days before Christmas in various gardens in St. Mary's, where it flowers profusely. Mr. J. C. Tonkin tells me that the home-grown or English roots are not satisfactory, and the Scillonians have had to fall back upon those collected in Italy and neighbouring countries. The size of the

although the Scillonians should neglect no item in improving their cultural methods, and spare no expense in adopting the best ideas and the best sorts of flowers. The prosperity of the islands now rests almost entirely on the floral industry, which is fraught with uncertainty, and peculiarly amenable to competition. *W. Roberts.*

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM HERA, n. hgb.

This is a new and very pretty hybrid, raised in the collection of R. H. Meunier, Esq., of The Woodlands, Streatham, between *Cypripedium Spicrianum* and *C. villosum*, the former being the seed-parent. A flower has just been sent to Kew, from which the following description has been drawn up. The characters of both species are well represented in the hybrid, those of *C. Spicrianum* somewhat

and shining, though less varnished in appearance than many other hybrids partly derived from *C. villosum*.

ONCIDIUM SPLENDIDUM, A. Rehb.

Oncidium splendidum has been pronounced as without doubt the finest *Oncidium* hitherto discovered, and whether this is so or not, there can be little doubt that it comes very near attaining this proud position. At the present time it is flowering in various collections, and when well grown its large panicles of golden flowers with red-brown markings on the sepals and petals are very effective. It was formerly considered to be a variety of the violet-scented *O. tigrinum*, and certainly there is a strong resemblance if individual flowers are compared. But what has struck me especially in comparing the two—with an eye, no doubt, to those botanical characters which may serve for the natural subdivision of this large and difficult genus—is the total dissimilarity of habit between them, so great, indeed, that they might well be placed in different groups. *O. splendidum* has the single large and very fleshy erect leaf, from the apex of a comparatively small pseudobulb, of the groups which contains *O. Cavendishianum*, *O. Lanceanum*, *O. bicallusum*, and several others, to which Lindley gave the name of *Sarcoptera*, in allusion to the fleshy wings of the column, and to confirm this position of *O. splendidum*, he it is noted that the light rose-coloured wings are just as fleshy as in other members of the group. *O. tigrinum* is placed in the group *Plurituberculata*, and has a pair of thin arching leaves at the apex of the pseudobulb, as in others of the same group. However close may be the affinity between the two species, there is this important difference between them, and no one would ever confuse them together when out of flower. *R. A. Rolfe.*

TURKEY OAK STRUCK BY LIGHTNING.

On the Holwood property, one of Earl Derby's Kentish seats, no fewer than seven trees—four English and two Turkish Oaks, and an Austrian Pine—were struck by lightning during last summer, and that, too, in the short space of seven weeks.

The Turkey Oak (I find from a record I have kept) has been peculiarly free from damage by the electric fluid, but that it occasionally does suffer, and suffer most severely too, a glance at the annexed illustration clearly demonstrates.

This Turkey Oak was one of the largest trees of its kind at Holwood, and, as will be seen from the following figures, had a noble stem, and fine spread of branches. It had a south-eastern exposure, was standing 75 feet from any other tree, the nearest being a large Elm, and was neither the largest nor smallest in that part of the park. It stood 76 feet in height, and had a clean, well rounded stem, which girthed 11 feet 5 inches at a yard from the ground. At about 10 feet from the ground the stem branched out into three large limbs, the girth of each at a yard from point of junction with the main stem being 7 feet, 1 foot 9 inches, and 1 foot 5 inches respectively. The lightning would seem to have struck the tree at 62 feet from the ground, and in descending shattered the main stem and branches in a most remarkable manner. The butt, to the length of 8 feet, was literally split into shingles, several planks of that length, and of a uniform thickness in inches, being preserved as a memento of the tree, without any preparation whatever, but just as left by the lightning. In passing downwards, the lightning seared the wood, leaving it in most places quite black, as if a hot iron had come in contact with it, and tore up the ground round the base of the tree for a depth of 21 inches.

After being struck, the appearance of the debris was curiously regular, the branches lying in a most regular manner around the stem, and forming almost a perfect circle of 99 yards in circumference. As showing the force of the lightning, it may be

FIG. 16.—TURKEY OAK TREE STRUCK BY LIGHTNING.

root is not altogether a criterion, for a tiny one half an inch long throws up eight or nine fine flowers all through the winter. An attempt has been made to cultivate *Freesia refracta alba*, which, with its exquisite perfume, and large trusses of pure white flowers, should prove a most valuable addition to the long list of winter flowers. But from some unaccountable reason it has never "taken." If only some *grande dame* would "patronise" this beautiful plant! Mr. Tonkin sowed half an ounce of seeds at the latter part of March, in one year, and he had a constant supply of flowers from the following September until January.

A recent writer in the *Cornishman* has pointed out that up to the present time Spain, Italy, Algeria, and other warm countries, have competed with Scilly in the wholesale culture of flowers for market; but the superiority of the home transit to the foreign is greatly in favour of Scilly;

preponderating in the dorsal sepal, and those of the other parent in the rest of the flower, though on the whole it is as thoroughly intermediate as hybrids generally are. The peduncle and ovary are shortly villose, the bract more than half equalling the latter, light green, and blotched with purple on the lower half. Dorsal sepal broadly orbicular, the margins strongly reflexed, colour white, with light green base and broad dark purple median band, and some light purplish marblings on either side of the same, and about half way to the margin. Lower sepal ovate, and lightest green. Petals cuneate-oblong, the upper margin undulate, the lower half pale green, the upper one light purple-brown, passing into lines of dots below, median band narrow, dark purple-brown. Lip smaller than in *C. villosum*, but otherwise much resembling it, light purple-brown in front, paler behind, internally marbled, and spotted with bright purple-brown. Stamens obovate-orbicular, the margin slightly raised, surface strongly papillose, colour light purple-brown, with a central dark green, slightly raised boss. The whole flower is bright

stated that pieces of the bark up to eight ounces in weight were carried for 101 yards from the tree, and a block of timber weighing 2 cwt. 23 lb. was pitched bodily from the main stem to a distance of 42 feet (this block being 8 feet 3 inches long, and girthed at the smallest part 2 feet 11 inches). When cut up, the tree contained twenty-six loads of wood, and the branches were bound into 146 faggots. Two hours after being struck (on August 24, at 4 o'clock in the afternoon), a sulphurous smell was distinctly recognisable for several yards away. Another Turkey Oak was divested of half its bark for about 60 feet up, but did not suffer otherwise.

Amongst the English Oaks struck by the electric fluid, were two peculiar cases, the first in which the tree was struck at a stated height up, and in descending run along the private telegraph wire to Holwood House. In another instance, the tree was struck at about 50 feet from the ground, and a clean triangular piece of wood, bark and all, removed in a perfectly straight line downwards therefrom. The piece removed was about 2 inches to side of the triangle.

The knotty branches of the Austrian Pine seemed too hard and cross-grained for the fluid, which evaded them in at least three places in a distance of 32 feet. *A. D. Webster.*

BOUGAINVILLEAS.

In bygone years the flowering of a plant of *Bougainvillea speciosa* was an uncommon occurrence, and the gardener who was successful was brought into prominence, as was the case with Mr. Daniels, gr. to B. R. Keene, Esq., of Swyncombe, Oxon. Mr. Daniel's secret, like almost everything pertaining to gardening practices, was soon made known, and was found to consist in giving the roots a strong dry bottom-heat, which seems essential to ensure the fullest success, as wherever specimens are so favoured, they are generally very floriferous. The best example I have ever seen is now to be found planted at Orwell Park, near Ipswich, where it stands at the back of a hipped roof-plant-house, and near to the boiler. The plant has but limited root-space, the border in which it is growing being only 9 inches wide, and raised above the path to a height of 2 feet; but there is no doubt some roots have got through the partition. The stem which is now very large, and the branches and shoots cover about 150 square feet of the roof, and the amount of bloom yielded is truly surprising, nearly every twig being festooned with beautiful bracts. These are of high colour, the effect of full exposure to the light. When the plant is in bloom, the air of the house is kept dry, and moderately cool, so that the bloom lasts in perfection a long time. The growth made yearly is of medium strength and length, and is so thoroughly matured by keeping the roots dry, after the young shoots are formed, that every leaf falls. The dryness and warmth of the border seem the two essentials of flowering this plant, and those who possess such conditions can secure fine blooms in midwinter. In very sunny houses I have seen good plants of this *Bougainvillea* growing in pots or slate boxes, the latter being perhaps the better, and those who cannot get the roots near a boiler may by using a slate box stand it on the pipes and so give it the requisite heat.

The warm and dry treatment is begun when growth ceases, and is continued for two or three months without hurt to the plants. *B. glabra* is a spring and summer blooming kind, and requires less heat than *B. speciosa*, the one just noticed; indeed, the first named of these will live in an ordinary greenhouse, or may be kept in a cellar or shed with *Fuchsias*, if kept dry at the root. For years I had plants so treated, which, when pruned back and started, flowered freely, and did duty in the conservatory before the roof climbers made the shade they now do.

When subjected to cold treatment, *B. glabra* becomes deciduous, as then it sheds its leaves; but in a warm-house, unless the roots are quite under

control and be kept dry, it retains them, and remains green through the year. Unlike *B. speciosa*, which flowers on the wood of the previous year, *B. glabra* blooms on the young shoots, and therefore the way to manage the plants of this variety is to spur them in, which should be done just before they start, and if planted out and growing as a roof climber, it is necessary also to be frequently thinning as well, after the shoots move, or they soon become a dense mass; but this rampant growth may be checked by cramping the roots. To propagate either of these plants, take cuttings of young shoots of 3 inches long with a heel, and insert them in sharp sandy soil—cover with a bell-glass, and place in strong heat. The only insect which affects *Bougainvilleas* is greenfly, which are troublesome when the shoots are young and tender. The best remedy is gentle fumigation with Tobacco, repeated night and morning for several days in succession, as there is much danger in giving strong doses, which will bring down the inflorescence wholesale. *J. S.*

FOREIGN CORRESPONDENCE.

NOVA SCOTIA.

THE RED-BERRIED ELDER.—The interesting notices you have already printed respecting the red-fruited Elder induce me to send you still another suggestion as to the cause of the want of success with it in certain localities. This shrub is very abundant as a native plant in some parts of Nova Scotia, and presents a striking appearance when laden with its weighty clusters of scarlet berries. In the summer season I am frequently asked what those berries are that grow so abundantly on the rocky railway banks near Halifax, that ripen so early, and are so beautiful. The Poison Elder, as it is commonly called here, makes the greatest show on rough, rocky, or stony places near the shore, where there is good natural drainage, and some accumulation of vegetable soil around the roots, with a moist atmosphere overhead. These appear to be its favourable conditions, suggestive to the planter of a lake or river bank, or terrace overlooking a harbour as suitable sites. I cannot conceive anything likely to be more effective than masses of this shrub planted along the margin of a lake or pond (as the *Rhododendrons* are at Trenton), so as to be mirrored in the sheet of water. This shrub is not likely to suffer from atmospheric dryness anywhere in England, but it may do so from poverty or wetness of soil, or want of autumn sunshine to ripen its wood, if planted in a shady place. I recollect a number of years ago, while walking through the village of Eisenach (Thuringia) with a friend, Mr. J. A. Haage, of Erfurt, we picked up a spray of it with an immense bunch of scarlet berries that had apparently been thrown over an adjoining garden wall. I have since seen it flourishing on the Pacific slopes of Colorado, in cañons of the Elk mountains, as on the Atlantic coasts of Eastern America; Mr. Meehan testifies in your columns to its splendour in Alaska; it caught the eye of Michaux on his visit to the city of Quebec, July 19, 1792 (see his *Journal*, edited by Sargent); *Botany of Beechey* locates it at Avatschka Bay, in Kamtschatka, lat. 53° N.; and the Russian Floras testify to its wide distribution throughout other parts of northern Asia and Europe. It is one of the hardiest and most easily grown, and most easily propagated shrubs in existence.

I was not prepared for the discovery made by Mr. Meehan (one of the most accurate observers we have on this continent) that there is enmity between the Elder and the sparrow. Our experience here has to come. A small colony of *Passer domesticus* was harboured a good many years ago at the General's quarters in Halifax, and soon took occupation of the swallow's nests at the Artillery barracks. But the military locations have been gradually deserted, and the sparrows have lately formed their headquarters in the centre of the city, occupying the

eaves of the Province Building, and perching on the trees of the surrounding grounds. Last week a new contingent came to the port of Yarmouth on board a vessel from Boston, laden with Oats. But here no sparrow has, so far, gone out into the country where Elderberries grow. What is the correct botanical name of the red-berried Elder? This shrub was named by Linnaeus in *Species Plantarum*, l. p. 358, *Sambucus racemosa*, being founded on *S. racemosa rubra*, Bauhin, *Pinax* (1671). "Habitat in Europæ australis montibus." This name was adopted by Willdenow, Aiton, and others, with knowledge only of the European plant. In 1803, Richard described the American plant as *S. pubens*, in Michaux's *Flora Borcali-Americana*, but two years later changed the name to pubescens in Persoon's *Synopsis*. In 1820, Roemer and Schultes accepted the name pubens, remarking, "*valle affinis racemosa*." De Candolle also adopted it in the *Prodromus* (1830), adding, "*Affinis S. racemosa. Fructus diam ruber*." This specific name, pubens, was adopted generally by botanists for the American plant up to a recent date; but, in 1833, Sir William Hooker, in the *Flora Borcali-Americana*, placed both the American and European plants under the one original name, *racemosa*, observing:—"I do not find that [the Rocky Mountain and Pacific specimens] or the Eastern [American] state of the plant can in any be distinguished from the European *S. racemosa*, which I also have from Siberia. The fruit is red." Ledebour, in the *Flora Rossica*, 1844-46, followed Hooker in including *S. pubens* of Michaux, in *racemosa*. In 1850, Gray, in Brewer & Watson's *Botany of California*, l. p. 278, did likewise, stating that "the Californian and Rocky Mountain specimens are as glabrous as the European plant; in British America and Alaska it is commonly pubescent, as in the Atlantic States variety pubens." Sereno Watson had relegated it as *S. racemosa* var. pubens, in *King's Report*, v. p. 133. Finally, Gray, in the *Synoptical Flora of North America*, vol. i., part ii., p. 8, reduced pubens to a simple synonym of *S. racemosa*. That there are distinguishable varieties and forms of the species is obvious, one of the best marked being probably *S. racemosa* var. *arborescens*, Meehan, a name which Mr. M., by slip of pen, refers to Torrey and Gray. *George Luesson, Halifax, Nova Scotia.*

RED-BERRIED ELDER AT BRAENAR.

The mention of this plant on p. 639 of the last volume of the *Gardeners' Chronicle*, interested me very much; and as testifying to its hardiness, I would name the following places where it is found growing in the far north: in Sweden, at Piteo 65° 19' N.; in Norway, at Grøto 67° 50' N.; in Finland, on the west coast, in latitude 65°, and in several places in Norway, where the temperature falls as low as 40-45 Celsius below the freezing point, and at all these places growing freely and ripening fruit. In some situations severe frost kills it to the ground, but the following summer shoots are sent up from four to five feet in length. *James Loney, Ofveras, Gothenburg, Sweden.*

KEW NOTES.

IRIS BAKELIANA and *I. SOPHENENSIS* are both in flower at Kew, the former being amongst the prettiest of the reticulata set we have yet seen. The inner segments are soft blue, whilst the outer ones have deep velvety tips, and a yellow-marked claw. It is as fragrant as the Violet, and will doubtless prove a most useful adjunct to our spring Irises. *I. sophenensis* is distinct in its reddish-purple, orange marked flowers, not so bright or attractive as the old type.

Iris Bornmilleri, Haussk.—A very charming and extraordinary little *Iris*, under the above name, is now in flower at Kew. It does not appear to have been described anywhere, and the only references we have been able to get at are a note by its introducer, Herr Max Lechtlin, of Baden-Baden (*Gard. Chron.*, 1889, ii., p. 279), and in the *Wiener Garten Zeitung*, 1889. It is a pretty, soft golden-yellow flowered species; but what strikes one most is the very rudimentary petals, which in some of the flowers are

almost entirely suppressed, and which incline us to believe it to be a mere variety, even if distinct from Niphoon Danfordii, Baker, *Journal of Botany*, 1876, v. p. 265. It agrees entirely with the latter as far as we can make out, in the almost entire absence of petals, the slight beard on the sepals, the orange-yellow, brown-spotted flowers, and the several protecting spathes, reaching almost to the top of the narrow tube. Iris Danfordii is a native of the Cilician Taurus, where it was collected by Mrs. Danford, along with many more interesting bulbous plants. In a short note Mrs. Danford says that this Iris is "abundant where it occurs," but evidently very local, as she only met with it twice. It blooms about the beginning of March at an elevation of 4000 feet. It is only one-flowered, each plant growing apart from the other. When in bloom it has only narrow sheathing leaves, and grows from 2 to 4 inches high. The exact locality where it was found was the western side of Anaska Mountain, really a continuation of the Ala Dagh range. Here, on a slope of sandy earth, grows the yellow Iris in close company with a brilliant orange Crocus. On the banks of the little rivulet, near where Iris Danfordii grows, such plants as Primroses, Violets, Scilla bifolia are to be found in large patches, and on the grey rocks above large clumps of *Cystopteris fragilis*, *Asplenium Trichomanes*, and *A. ruta-muraria*. Amongst the bulbs found in the same locality are *Fritillaria aurea*, *Hyacinthus azureus*, *Bellevalia ciliata* and *hispidia*, all of which are perfectly hardy, as our beautiful yellow Iris will most likely also prove. The locality given by Herr Max Leichlin is Armenia, no particular district being specified, and it may turn out to be not far distant from Mrs. Danford's original locality. Whatever may be Dr. Foster's final determination, one thing is certain. This Iris is certainly an acquisition among spring flowers, its pretty yellow flowers peeping above ground in January will always be looked forward to with interest and pleasure.

Galanthus ambicus.—A Snowdrop has come to us from Italy under the above name, and though flowering this year a little earlier than most of our established tufts, it proves to be nothing more or less than our common *G. nivalis*. The present rush after new names is to be deplored; and does not justify anyone in going to a certain locality, collecting a few bulbs, and distributing them under the name of that locality, without even taking the trouble to see if they have any distinctive features entitling them to a new name. Its early flowering is only of a temporary nature; it is well known that all bulbs ripened in the sunny south flower earlier the first year with us, but they soon drop back to a level with our old tufts. The common Snowdrop is always welcome as *Galanthus nivalis*. *D. Douar*.

LIST OF GARDEN ORCHIDS.

Continued from p. 55, col. iv., &c.

LÆLIA.

86. LÆLIA, Lindl., *Gen. & Sp. Orch.* (1831), p. 115; Benth. and Hook. f., *Gen. Plant.*, iii., p. 533. — Pollen-masses 8, other characters as in *Cattleya*. Species about 20, occurring in the maritime provinces of Southern Brazil, and after a wide interval, in Southern Mexico and Guatemala; no species being common to the two widely dissevered areas. For hybrids between this genus and *Cattleya*, many of which have been referred here, see LÆLIO-CATTELEYA.

Opusc.*, p. 19. — Mexico. First introduced into European gardens in 1836, in which year it was received from Mexico by Mr. Tayleur, of Parkfield, near Liverpool. Shortly afterwards it was imported by other horticultural firms. It is spread over a considerable part of the Mexican highlands, where it grows on bare rocks, stunted trees, and similar situations, exposed to the full force of the sun and rain. The flowers are used in Mexico for the decoration of the churches on All Saints' Day, and hence its vernacular name of "Flor de todos los Santos," or All Saints' Flower. It is far less variable than *L. anceps*, but the following varieties are known:—

Var. ATROPURPUREA, Weber, in *Deutsche Gart. Zeit.*, 1856, p. 162, fig. 41, 42.

Var. ARGYREUS, Backhouse, in *Gard. Chron.*, 1879, pt. 2, p. 232; *The Garden*, 1880, pt. 1, p. 368, t. 229; Warn. and Will., *Orch. Alb.*, ii., t. 49. A brightly colored form.

Var. PURPUREA, *Lælia purpurea*, Lindl., *Bot. Reg.*, xxv. (1830), t. 26; *Bot. Mag.*, t. 3810; Hook., *Cent. Orch.*, t. 25. *Bletia purpurea*, Rehb. f., in Walp., *Ann. Bot.*, vi. (1861), p. 428. Discovered by Count Karwinsky in the neighbourhood of Caxaca, at an elevation of 7,500 to 8,500 feet, and subsequently by others, in other localities, but always at a high elevation. It was imported by Mr. Barker, of Birmingham, and sent to Dr. Lindley, in November, 1838. It is generally considered a distinct species, but it seems to me rather a dwarf alpine form of *L. autumnalis*, with the petals unusually broad, and the scurfiness of the ovary more strongly developed. The two seem to be gradually run together in a series of specimens.

Var. VENUSTA, Goldring, in *The Garden*, 1884, pt. 1, p. 306, t. 428. Much paler than the variety atropurpurea, otherwise very similar.

Var. XANTHOTRICHIS, Rehb. f., in Sander's *Reichenbachia*, i. (1835), p. 21, t. 10. A form quite intermediate between typical *L. autumnalis* and the variety furfuracea, though there seems no reason for supposing it a hybrid between them, as suggested. It is said to flower in July and August. *R. A. Kelly's Herbarium*, Kew.

Var. YENUSTA, Goldring, in *The Garden*, 1884, pt. 1, p. 306, t. 428. Much paler than the variety atropurpurea, otherwise very similar.

Var. XANTHOTRICHIS, Rehb. f., in Sander's *Reichenbachia*, i. (1835), p. 21, t. 10. A form quite intermediate between typical *L. autumnalis* and the variety furfuracea, though there seems no reason for supposing it a hybrid between them, as suggested. It is said to flower in July and August. *R. A. Kelly's Herbarium*, Kew.

TREES AND SHRUBS.

RETINOSPORA [OBTUSA VAR.] TROUBETZKOYANA. Hort. Rovelli.

UNDER this name Messrs. Rovelli, of Pallanza, whose collections of Coniferæ and of Camelliæ are so remarkable, obligingly send us specimens of a seedling form of *Thuja (Retinospora) obtusa*—or such we take it to be. Judging from the specimen before us, it is a dwarf compact variety, densely branched with short divaricating branchlets covered with appressed bright green rather thick, lanceolate, acute but not acuminate leaves, with a central gland on the back. Mr. Nicholson, who has seen the plant growing, speaks highly of it for decorative purposes.

THUYA [BOREALIS] VAR. NIDIFERA. Hort. Rovelli.

For this we also are indebted to Messrs. Rovelli, who call it *Thuyopsis nidifera*. From the specimen before us we incline to the belief that it is a seedling form from *Thuja borealis* (alias *Nutkaensis*), and if so it is remarkable, as that species is relatively less variable than some of its near allies. The specimens before us are feathery-looking with slender, pinnately branching shoots, densely covered with appressed, deep apple-green, subulate leaves, each with a central gland on the dorsal surface. The plant must be a very attractive one.

THE FLOWER GARDEN.

THE WORK ON THE LAWNS.—At this season it is specially desirable that the lawn should be kept scrupulously neat, for however fine the specimens of trees and shrubs may be—unless the lawn be kept in first-rate order, these objects will fail to produce the effects they were intended to give; hence the lawn should be frequently swept, but avoiding doing so during very wet or very frosty weather. The season having been so mild, without snow and excessive rains, the making of alterations and improvements has been greatly facilitated. Any depression in the turf in which water may lay should have the turf run back, and be filled up with loamy soil, replacing the turf neatly, and beating it to its proper level. Any spot where the turf has been damaged by play, or other causes, should be mended with fresh sown turves, so as to ensure a perfect sward by the time it is again required. On dry days the lawn should get a thorough rolling after a sweeping.

Walks.—Now is the time to place the edgings of walks, if of turf, in proper condition, with the edging iron and line, paring the sides until you have a regular line, pleasing to the eye. Where the width of the walks is increasing, a strip of turf along the side should be cut and pushed forward on to the surface of the walk, the bare space left being turfed over. By doing this a new edge may be cut without making the walk wider than it ought to be. If the edgings are of Box, vacancies in the lines may be made good, or the whole of it re-laid. Edgings of tiles, flints, &c., should be put straight. The existing drains and catch pits in walks should be examined, and if stopped up they should be cleaned out. Where it is intended to carry drains along existing or new walks, such should be placed down the centre, and short branch drains carried into them from the catch pits or gratings at the sides of the walk. New gravel may now be placed on walks, previously passing it through a screen or sieve to remove all large stones. Where gravel is covered with moss or weeds, it may be turned with a steel fork or the spade, and afterwards rolled smooth.

Seeds and Flower Roots.—Several useful plants now require to be sown early in heat if they are to be had ready for the beds. Among the first lot to be sown are *Eucalyptus globulus*, *Acacia lophantha*, *Centaurea candidissima*, *C. Clementina*, and *C. gymnocarpa*; *Cannas*, *Pyrethrum aureum* and its varieties, *Begonias*, &c.

A sowing of Sweet Peas should be made in the open ground in prepared trenches, or in clumps in the herbaceous borders or shrubberies. These will come into bloom early. A sharp look-out must be kept for slugs.

Begonia and *Dahlia* roots should be introduced into gentle heat for the supply of cuttings. I prefer to strike *Begonia* cuttings on a gentle hotbed, covered with about 3 inches of finely-sifted soil composed of one-half well-decayed leaf-mould, one-fourth loam, and the rest red or silver-sand. It does not matter whether the cuttings are taken off with a heel or not; when struck, they may either be potted, or hardened off where they are. If inserted about 4 inches apart, they will take up with good balls of soil well filled with roots, and can be transferred directly into the flower-beds.

Pruning and Training.—Creeper and climbers on walls, with the exception of those flowering now, such as *Jasminum nudiflorum*, should be pruned, nailed, or tied, as required. I strongly advise in all cases, where practicable, that wires be placed on walls for training, as it preserves the wall from further damage, and greatly facilitates the work of training.

Herbaceous never were more popular than now; they are best divided or removed at this season of the year. Perhaps one of the largest and most successful growers of this valuable flower resides in this neighbourhood; he grows many thousands, and has about completed his propagation and planting. Old plants which have been kept in pots until they have almost ceased to flower if turned out again, the old portion cut away, and planted out in the open ground in highly-manured soil, in a slightly shaded and moist position, will soon recover. They should be kept well mulched, especially during dry weather, and means taken to keep the slugs from them.

Chrysanthemums.—The old plants turned out from pots may be planted out between the shrubs, or in the herbaceous borders, where, if a favourable autumn prevails, such as we experienced last year, they will tend to make the flower-garden gay during the dull period of the year. *D. C. Powell, Powderham, Exeter.*

THE HARDY FRUIT GARDEN.

PEACHES AND NECTARINES.—These fruits, where grown extensively in favoured situations, should now be liberated from their fastenings and tied out to stakes in front of the wall, where the buds will be better retarded than by any other means during the remaining days of this month and February; the pruning may be done before they are liberated, but it is better to defer it till a little later. All the snags left from the autumn pruning should be trimmed over, and all the branches and young shoots washed with soap and water. Some gardeners paint their trees with strong insecticides after having pruned them, and I used to follow this practice; but by washing the growths twice with soap and water, I have found that scale never makes any headway even if there should be any of it present, and the risk of injury to the buds by the insecticides is avoided. If the walls are old and the joints open, and many nail-holes exist in them, a good washing with hot lime and a little linseed oil applied with a half-worn-out brush, is efficacious in ridding the wall of insects; and if training to wires in the fashion followed, it is a good plan to have all the wires painted if these are galvanised, for shoots tied close to them are often injured to such an extent that they have to be cut away. So far this season has been favourable for pushing on with manuring, renovations, &c., and any quarters of fruit or the soil round individual fruit trees, which may have become exhausted, should be dressed with good loam, or a mulching of half-decayed manure placed around each tree or bush. This encourages surface-rooting, which will have a marked effect on the subjects so treated.

Raspberry Plantations.—All staking and tying, if not already done, should at once be taken in hand, first thinning out the canes, not leaving too many to a stool, as these become crowded during the summer, and do not allow the fruit-bearing laterals to develop properly. If the locality is a damp one, the shortening back of the canes is better left until March, as by so doing the lower buds break much later. The ground should be heavily mulched with decayed manure, if it be of a light nature, but heavy and retentive soils may be dressed with charred refuse and soil. Digging must be avoided, merely the weeds being hoed-up and raked off, and where mulching is done annually, very few weeds grow.

Gooseberry Plantations.—The bushes are frequently left until the spring before being pruned, but to have this operation standing over is certainly an inconvenience, the object of leaving them being that there is a better chance for the fruit-buds after the hard weather is gone. In bird-infested districts like this, where the bullfinches can be counted by the score in a flight, it is much the better plan to cover the Gooseberry quarters with permanent galvanised iron wire netting. Standards of 6½ feet above ground being fixed up at intervals to carry it; and the netting should be of 1 inch mesh.

A great many growers adopt early pruning, and rely on a dressing or two of thin lime-wash, strained through a hair sieve, and applied with a syringe or engine, but the result is not altogether satisfactory, the finches and sparrows not being deterred by this dressing. A good plan, and one which I have found to answer, is to run some wire netting a yard high, and of 1 inch mesh round the quarters, securing it to stout stakes, and covering the enclosed area with square mesh tanned fish netting, removing it when the fruit is set and safe. In pruning, thin the shoots severely in the centre of the bush, and avoid overcrowding anywhere. Good shoots should be selected for cuttings, if such are wanted, and these should be put into two-thirds of their length, rubbing off all buds beneath the upper four. If caterpillars have been troublesome during the past season, the soil underneath each bush should be shovelled up to the depth of two or three inches, and carefully carried to a heap of refuse and burned, slaked fresh lime being then applied as a top dressing, and fresh soil in place of that which was removed. Mulch the ground with half-rotten manure.

Gooseberry growing here is rather an important bit of work, a supply of fruit being required for as long a time as possible, and I will mention my various modes of planting the bushes, &c. First, there are six trellises, 4½ feet high, and the same distance apart, and on these are grown fruits which are kept solely for the members of the family and their visitors to pick and consume on the spot; and just when they are ripening, the bushes are spurred in, the ground is covered with clean straw so as to be accessible in any state of the weather, and there is no pricking of the fingers. Planting the Gooseberry on walls well repays for the space they take up, for it is surprising how long and regular is the supply from that source if planting is done on different aspects. I gathered the last dish of Warrington on November 23, and these were of good flavour. Wainham's industry is an excellent variety, both for flavour and bearing, and also lateness. *A. Evans, Lythe Hill, Haslemere.*

ORCHID NOTES AND GLEANINGS.

LELIA ELEGANS BLENNHEIMENSIS.

This is a magnificent variety, with fine ever-green foliage. It has slender, terete stems, some 2 feet high, bearing on the summit a pair of linear, oblong, coriaceous leaves. The flowers proceed from a small sheath situated between the leaves; these are well formed, and of good substance, and measure individually 5 inches across; the sepals are of a pale rosy-purple, becoming deeper in colour towards the edge; petals intense rose-purple; lip three-lobed, anterior lobe deep magenta-purple, veined with a deeper shade of the same colour; throat yellow. The flowers of this variety appear at a most unusual time for a dark variety—that is, in the month of February, and they continue in perfection for three weeks or a month.

We find from experience that this section of *Laelia elegans* requires a warmer and closer atmosphere than most of its congeners, by which means their stems are not allowed to shrivel; indeed, they require to be kept in a shady place, and their stems and foliage kept moist, until they plump up and form new roots. These plants require great attention, and should never be allowed to flower until they have become well rooted and thoroughly established. We cultivate the plants belonging to this section of *Laelia* by themselves, using one side of the house for them, a position in which they have full exposure to the light, but are shaded from the hottest sunshine. Here we give them an abundant supply of moisture between the pots and on the table, in order to pro-

duce a moist atmosphere during the season of growth; but in the winter months this is considerably reduced, and as we give them only sufficient to keep their bulbs in a plump and healthy condition. The pots must be well and thoroughly drained, the best material to use about their roots is good, fibrous, upland peat, and this should be made firm. They thrive equally well in either pots or baskets, and may be hung up near to the roof-glass; but there is one thing to avoid in this situation—it frequently becomes a very chilly place in winter, and therefore we would avoid too close a proximity to the glass during extreme cold weather. "*Orchid Album.*"

PESCATOREA CERINA.

This is a beautiful evergreen plant, entirely destitute of pseudobulbs, merely having a tuft stem, formed in the axis of the leaves; the flowers measure some 3 inches across, the sepals and petals being fleshy in texture, concave, roundish-oblong, of a pale waxy lemon colour, the lateral sepals being somewhat darker, and the lip clear yellow. It blooms during October and November, and continues in beauty for a very long time.

This plant is successfully cultivated by different growers in various ways, and in various temperatures; but hitherto they have not proved long-lived plants under cultivation. This, however, arises from the want of knowledge of some special requirement, which, when once we have gained, there will be nothing to prevent us growing it, and all the species of the genus, with ease. Great care is necessary in the management of these *Pescatoreas*, and we have found it a good plan to keep them as fair-sized plants rather than to attempt to make large specimens, as the roots generally rot away when the plant attains large dimensions, and this is fatal in most instances, unless the old soil is at once removed, the roots washed, and any dead roots cut away. The plants should then be re-potted and placed in a shady situation. Basket culture is best for them, and good drainage is essential to their well-being, requiring, as they do, a liberal supply of moisture to the roots all the year round; but it should be allowed to pass away quickly and thoroughly, leaving nothing behind to stagnate. But little mould should be used about their roots, and this small quantity should consist of fibrous peat and sphagnum moss. The plants should be well watered by mixing some nodules of charcoal with the soil, and we find the warm end of the Cattleya-house the most suitable position for them. Cultivated either in baskets or in pots, the plants, when in flower, should be placed in such a position that the blooms when open are in the line of vision, as in this manner the best effect is produced, and they can be the more easily inspected closely. "*Orchid Album.*"

THE ORCHID HOUSES.

INTERMEDIATE-HOUSE.—In this house grow *Vandas* of the *suavis* and *tricolor* sections, and those and *Odontoglossum vexillarium* should be very carefully looked over to see that no thrips are infesting them. When doing this, it is good practice to carry a camel-hair pencil, so that if a spot on a leaf catches the eye, it is easy to touch it with some saliva, and this, if carefully done, will keep down thrip; still, it is a good plan to dip the plants twice or thrice in a year—the first time when the flower-spikes are coming up, and again directly after they have done flowering.

Odontoglossum grande should now be kept very dry, as it is a plant which requires less water than any other plant of which I know. Plants of *Masdevallia towarensis* which have done flowering may now be repotted, if that be necessary. The *Pleionies* which have been kept cool since being repotted should be brought in, and kept moist, but too much water must not yet be applied, or the tips of the leaves will be very likely to turn of a brown colour.

The new *Vanda Amesiana*, now in flower with us, is a very delicate-looking flower, and withal useful, and seems to do very well in the same house as

the other *Vandas*. Temperatures for this house may range from 55° at night, to 60° by day.

Cool-house.—It has been my practice for several years past to repot all the *Odontoglossums* and the *Masdevallias* in the autumn, which is much more satisfactory than doing it in the spring. Plants repotted last September, are now furnished with roots running over the sides of the pots. However, no one who has plants of either species which were not repotted in the autumn, should lose time in ascertaining which of them requires it, and which may safely be left until next September. In repotting, care should be exercised not to use a pot that is too large, and to fill it to three-fourths of its depth with clean potsherds, and put over this a sprinkling of sphagnum, and before placing the plant in the pot, to squeeze a firm lump of fibry peat into the centre of the pot as a firm basis for the plant to rest upon, holding it firmly in this position while packing the materials neatly around the plant. The temperature may be at night 45°, and by day 50°.

East Indian House.—Where plants of *Phaius tuberculatus* have done well, the flower-spikes will be showing freely; and the plant being one that is very subject to attacks of thrips, it is necessary to examine it daily. With us the plants grow in Teak baskets, hung up close to the roof, and near to the ventilators. I find that *P. tuberculatus* likes a compost of sphagnum moss, peat, and turf, in equal proportions, with a small quantity of silver-sand added to it. I have found that its congeners, *P. Humboldtii* and *Henyrii* also, do well in the same compost. It is almost too soon to say with certainty in which temperature these latter varieties do best, but our plants seem to grow the strongest in the intermediate-house, though I am assured by some authorities that they come from a very hot region. I am, at any rate, trying both hot and intermediate-houses, and at present I like the plants that are in the cooler house the better.

Calanthe vestita oculata gigantea, now coming into flower, is the best of the deciduous *Calanthes*, and a free grower, that makes large bulbs and flower-spikes. Another good feature of the plant is, that it keeps its foliage perfect until the flowering is over. At the present time the plants require to be well supplied with water, but less will be required when the foliage begins to change colour. *A. G. Catt, Parkfield, Worcester.*

FLORISTS' FLOWERS.

SPECIMEN CHRYSANTHEMUMS.

MUCH has been written of late against the method generally adopted at the present time of training specimen plants. A great fault is, I think, made by deferring the training and the final tying of the shoots too long after the flower buds are formed, and which in many instances does not allow of the leaves righting themselves before the flowers are expanded and the plants shown. Nothing looks worse than to see the blooms flattened down on the foliage, for in a properly trained *Chrysanthemum* every flower should stand clear of the leaves, and each shoot should be at least one foot from the place where the growths are bent, or even more than that in very large plants. The bending of the branches should be done as early in their growth, and as close to the pot, as may be practicable. Probably the best specimens seen this season were shown by Mr. J. S. Graham, gardener to G. Lawson, Esq., Newland Grove, Hull, at the show held in conjunction with the provincial exhibition of the National *Chrysanthemum* Society. Each of his plants measured about 3 feet in diameter, and so deftly were the growths manipulated, that it was extremely difficult to discover, without very close inspection, where the stems were bent, so abundantly were they clothed with the dark green foliage, completely hiding the stems. The varieties were of the Mrs. G. Rundle type, which adapt themselves to this form of training admirably, the blooms which are produced by the trio of sports from this variety, always incurve perfectly, not like some other varieties which are grown in this way, which though not being well adapted for producing so many flowers on one plant, show a tendency to be hollow-eyed; and an incurved *Chrysanthemum*

in this state cannot be said to be a perfect flower, and sorts that are prone to be so should not be chosen for this mode of culture. It is the stretched-out 5-feet specimens of the flat cart-wheel type, with little foliage to hide the stems and sticks, bent shoots, and wires, that bring this form of training into disrepute, and draw down justly-merited censure, which falls, unhappily, upon the heads of all specimen-plant growers indiscriminately.

SPECIMEN CHRYSANTHEMUM JANE.

It may not be generally known that this lovely single-flowered variety makes a fine specimen, when allowed to carry from forty to fifty blooms, one on each shoot. When such a plant is fully developed, it is a charming object, the pure white, graceful blooms having long drooping florets, with a delicate twist at their points, and a bright yellow disc. The foliage is profuse, and when a plant is well done, it adds to its beauty. E.

FRUITS UNDER GLASS.

MELONS should be made ready for planting out. We generally lead off with two or three kinds as a first crop; after that, we grow *Blenheim Orange* only, and I know of no better variety for all-round purposes. The present is a good time to sow a batch for a second crop, putting two seeds into a 60-pot, using a light, fine soil, with a bit of holding fibrous turf in the bottom of the pot. Road scrapings, if gritty and calcareous without further mixture, suit Melons well.

Peaches and Nectarines.—The early house, if the tree be not already in flower, should have two gentle fumigations, so as to prevent attacks of green or black aphid before the young fruit have set properly. All misplaced flower-buds should be removed, those, for instance, on the under sides of the branches at the very base of the shoots, or those appearing under-sized or imperfect, as allowing the trees to bring forth every flower they show has a distressing effect upon them; but where bud-droppings has been prevalent (and I have heard of several cases this year), Nature will right itself if it be not too serious. Some varieties of Peaches are much worse than others, principally the large-flowering kinds, and notably *Noblesse* and *Alexander*, both of which have dropped with us this year. I attribute bud-dropping generally to dryness at the root during autumn or winter after the crop has been gathered, to too much fire-heat in starting to force, or to the rooting compost being too loose, but the first is the most frequent cause. Later houses should be pruned, borders dressed and otherwise prepared. It is advisable to dress both old and young wood with some insecticide. We use Gishurst's compound at 6 oz. to the gallon for the young wood.

Cucumbers.—It is sometimes difficult to maintain a supply through the month of February and during Lent, but if the winter plants have been grown thinly, neither stopped nor over cropped, the increasing daylight will soon work wonders. Keep up a good temperature, allowing 70° at night, with plenty of moisture, and little ventilation. Sow for successional plants.

Tomatoes should also be forwarded, and seeds sown. **The Fig-house,** if closed now, will give ripe fruit in May, but take every precaution to keep clear from scale or other insects. Use the syringe twice a day, using artificial means to dry the wood once each day. The temperature to start with should be about 45° to 50° for night, and 10° more by day. If it be convenient to have a bed of fermenting leaves in the house, there will be a considerable gain.

The Grape-vine must be frequently looked over, and bad berries (if any) at once removed. Keep it as cool as possible, consistent with dryness, watch the evaporation from the bottles, and fill them up as may be required. We add two tablespoonfuls of syrup, as that is said to preserve the flavour. *Wm. Crump, Madresfield Court, Malvern.*

PLANT PORTRAITS.

- HYPERICUM CALYCINUM*, and *H. MOSERIANUM* *Montivar Horticolæ*, January 10.
- NYMPHEA MARLIACÆA*, *Chromatella Illustratæ* *Montisheffe*, January.
- RAMONIA PYRENAICA ALBA*, *Garden*, January 11.—A lovely variety of a particularly interesting alpine plant.

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communication should be written on ONE SIDE ONLY OF THE PAPER, and sent as early in the week as possible.

NEWSPAPERS. — Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

MONDAY,	JAN. 27	Lilium auratum and Hardy Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	JAN. 28	Roses, Trees, Plants, &c., at the City Auction Rooms, by Protheroe & Morris.
WEDNESDAY,	JAN. 29	Roses, Fruit Trees, Shrubs, Border Plants, Bulbs, at Stevens' Rooms. Lilies, Greenhouse Plants, &c., at Protheroe & Morris' Rooms. Seeds of <i>Kentia Belomorana</i> and <i>K. Fordsteriana</i> , at Protheroe & Morris' Rooms.
THURSDAY,	JAN. 30	Imported and Established Orchids, and Importations of Lilies, &c., from Japan, at Stevens' Rooms.
FRIDAY,	JAN. 31	Imported and Established Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	FEB. 1	Roses, Fruit Trees, Shrubs, Border Plants, and Bulbs, at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK. — 38°.S.

The Weather Plant.

For some time past, at intervals, the newspapers have entertained their readers with accounts of a "Weather-plant," reputed to do many wonderful things, but only under certain conditions, involving considerable outlay for apparatus, &c. Our own attention has been repeatedly called to the matter, both by members of the trade, and by ordinary correspondents, to whom we have inculcated the desirability of a little wholesome scepticism and caution. The matter has, however, now come before the public in a more prominent manner by advertisements in some of the horticultural journals and seed catalogues, and especially by the publication in the last number of the *Kew Bulletin*, of a large number of experiments and forecasts made by the "discoverer," together with the results of independent observations on these so-called forecasts made by Dr. OLIVER and his assistant. According to the statement of the introducer of the Weather-plant, or his agents, the plant, by the movement in certain directions of its leaves or leaflets, forecasts the weather with absolute certainty forty-eight hours beforehand, whether sunshine, rain, wind, storm, &c., whilst subterranean disturbances are predicted three to eight days beforehand, according to locality. The pamphlet published by the inventor shows that the leaflets bend upwards for fine weather, down for rain, turn diagonally towards the stem for wind, cross for an approaching thunderstorm, and curl for a discharging thunderstorm, all forty-eight hours in advance; whilst for subterranean disturbances the branch

drops down altogether in that direction where such disturbance may be expected. Such was in substance the story as first told. It was also stated that thousands of confirmatory experiments had been made, that the Austrian Imperial Observatories, as well as many public establishments in that country had adopted the plant as a barometer.

Bearing in mind the movements of leaves according to various conditions of illumination, temperature, and moisture, and, as in the case of the Sensitive Plant, actual contact, there was, of course, no reason to doubt the occurrence of the movements in question; indeed, similar ones are matters of every-day observation, it was the inferences drawn from them that were open to doubt. But what, after all, are merely physical indications such as these by the side of those more subtle powers possessed by the *herbarionens* of the older writers? One *Oxalis*, we are told, shrunk abashed in the presence of vice, its leaves collapsed, and hence it was made to serve as a touchstone to eliminate the bad, to act as a love philter, to purge the guilty, and render them as free from taint as itself. No "weather-plant," even when cultivated under special apparatus, can compete with this *Oxalis* of Amboyna. Those, however, of our readers desirous of gaining, within short compass, a summary of the present state of knowledge on the subject, apart from romance, would do well to consult DARWIN'S volume on the *Power of Movement in Plants*. They must not, however, expect to find therein any such prophetic power attributed to plants as the Austrian observer claims for them.

Reverting to the weather plant it shortly transpired that it was none other than what is known to botanists as *Abrus precatorius*, the bead-like seeds of which are familiar to most people from their sardle colour, tipped at one end with black. These seeds are used for necklaces, and, so it is said, as weights for diamonds in India. The plant producing them is a common plant in most tropical countries, so that there could be but little difficulty in procuring large supplies at small cost. The plant itself is a shrubby twiner, with pinnate foliage like so many other of the leguminous family to which it belongs.

When the identity of the weather-plant was thus made known, botanists might well be excused for indulging in a little scepticism. The plant is, indeed, just one of those in which leaf movements are most likely to be well-marked. But an air of mystery was diffused over it—the seeds could only be procured at a relatively high price. We are told in a letter before us that "it cannot be cultivated in ordinary hothouses or like Orchids;" that "the Professor" has patented the only mode of cultivating it in Europe; that the price of the apparatus is £5 5s., £12 12s., or £52 10s., according to the more or less elaborate style of apparatus—all that expenditure for a tropical weed that we should have supposed to have been cultivated with the utmost ease in any warm house! Further, we were informed that there were two distinct kinds of weather plants, the B and the T plants, of which the latter forecasts the temperature forty-eight hours in advance, while the former indicates only "the weather."

Such statements as these, and made in such a manner, were not at all calculated to win the confidence of gardeners or of botanists. Not even the names of the Emperor of AUSTRIA, Baron ROTHSCHILD, or Prince SCHWARZENBERG were sufficient to destroy scepticism. The observatories and scientific societies of Austria, to whom we might fairly have looked

for confirmation of the statements made, have been, so far as we have observed, silent. The Vienna Professors, among whom are some of the most eminent vegetable physiologists of the day, men whose opinion would have been of special importance in such a case, have not, so far as we know, lent their countenance to it. A similar reticence would probably have been maintained here had it not been for the fact that, owing to the good-natured interposition of the Prince of WALES, the authorities at Kew were induced to allow the inventor facilities for carrying on his experiments. The Prince had been interested in the matter by the late Crown Prince of AUSTRIA, who, as is well known, had considerable claims to rank as a naturalist. In due course the "inventor" consented to deposit some of his plants in the JOURELL laboratory at Kew, and "to demonstrate from day to day over a sufficiently long period to allow of a fair trial, the predictions which he believed their movements afforded."

From the scientific side the experiments and observations made were watched and recorded day by day by Dr. FRANCIS OLIVER and his assistant, Mr. WEISS. The results are given at length, as we have stated, in the last number of the *Kew Bulletin*. In it are detailed in full the several movements to which the leaflets and the midrib of the leaf are subject, and the indications thereby alleged to be afforded as to prospective weather, the advent of earthquakes and the escape of fire damp in mines. The older leaves, it appears, only indicate the condition of the weather in the immediate neighbourhood; middle-aged leaves are good for 5 or 10 miles, whilst the younger leaves are so sensitive and precient as to serve as indicators for 50 miles! Since his arrival in England, the inventor has, we are not surprised to learn, been befogged. Fog or mist are, says he, "prophesied by irregular positions of the leaflets, indistinguishable from those indicating electricity in the atmosphere," so that the observer has found himself unable to distinguish between the effects of electricity and of fog.

Dr. OLIVER proceeds to give in parallel columns an illustrative series of forecasts made twenty-four or forty-eight hours in advance for eight different times of the day selected, and a record of the actual weather at the same hours on the days indicated. The critical examination of these forecasts (deduced, it should be said, in half the number of cases from the charts *after the event*), is given in full on pp. 14, 15, and at the end of the report are published some charts from the Meteorological Office which show little or no correspondence with those of the same days as prepared by Mr. NOWACK. It is hardly necessary to say that these documents afford little support to the statements we have recorded, and if we are to adjust our charts and forecasts after the event to make them correspond to the actual facts, it is obvious that we need not take the trouble to obtain seeds of *Abrus precatorius* and grow them under costly apparatus. The prophesying of events after we know what they are, can be done much more cheaply, and, as these observations show, with an equal amount of success! It is perhaps well, in order to satisfy popular curiosity, and obviate possible cavil, to have matters fairly tested, especially where, as in this case, there is a substratum of fact, else it would seem that the resources of the JOURELL Laboratory and the time of the skilled observers (but who, it should be said, are not Government servants, nor members of the Kew staff) might have been utilised

to greater advantage. All that Kew has done in the matter is to afford the requisite facilities. Kew cannot (any more than the Royal Horticultural Society, in whose gardens at Chiswick the experiments are being continued by the inventor) be held responsible for the correctness of the prophetic utterances.

Should the observations that have been made stimulate Dr. OLIVER or other observers to make experiments to ascertain the manner in which

tangible before the Fellows and the general public. It will then altogether depend on the amount of financial support which the Council receive whether the project be carried to a successful issue or not.

—We have received a second letter on this subject from Mr. HUMBOLDT, from which we make the following extract:—Establish a handsome hall in a spot commanding a constant flow of traffic; here initiate daylight occupations for the scientific, and evening entertainments for the people, and you will not fail

a home for the trapeze and the wire rope, as a mere shelter for so many drinking-bars, it would be a failure first, and finally a disgrace and a curse. That it would fail if perverted from the purpose for which it is proposed, cannot be doubted, and upon that assumption may be founded our expectation of success. We want a beautiful building, with sufficient space for half-a-dozen meetings to be held simultaneously, and a noble hall abundantly lighted both by day and night, with, perhaps, a bijou

FIG. 17.—VIEW IN THE BOTANIC GARDEN, NATAL. (SEE P. 116.)

external agencies, especially light, act on protoplasm, the labour and time expended on these "prophesies" will have received positive as well as negative justification. In any case, the thanks of the community are due to Dr. OLIVER for his clear and disinterested statement of facts.

HALL FOR HORTICULTURE. We are authorised to say with regard to the suggested hall, that the matter has been before the Council of the Royal Horticultural Society for the greater part of the past year. A committee of the Council was appointed in the autumn for the purpose of elaborating a scheme; and they hope soon to be able to bring something

of your reward, which will doubtless correspond with your deserts, and will crown good management with complete success. Our fortnightly meetings would soon acquire renown in a place reasonably adapted for them, and a flower show under the electric light, with suitable accessories, would do for horticulture what has never been done yet—we should outdo the "palmey days of Chiswick," minus the dreadful weather that first abolished Vauxhall, and then applied the surplus of its savagery to the best flower shows of this nineteenth century. A thousand uses for such a hall would arise as it acquired a name and a place in the economy of society, and the life of the thing would be in its independence and respectability. As an arena for lions and lambs, as

plant house, in which subjects requiring to be on the spot for a few days or more might be kept under observation, and flowered or fruited without disturbance, or danger of transit at unreasonable times. The Weather plant offers an example. It has been under operation for forecasting in a house in the Royal Horticultural Society Gardens at Chiswick, and has been seen by some dozen or score of persons only. In a conservatory on the Thames Embankment it would have been visited by hundreds, possibly by thousands. The kind of institution I have in view should be somewhat of a costly affair, and the requirements of the Royal Horticultural Society should have direct and primary attention in the original design and its several details. It need not be said that

under present circumstances the Royal Horticultural Society could not pay for such accommodation as it is proposed to provide, but it is a fair speculation that it soon will be able to do so. In the meantime I wish this point to be kept in view, that the edifice suitable for horticulture will be suitable also for many other purposes that may be honourably and usefully associated with horticulture. There is no such hall as we require, but there are a thousand uses for such a thing from the moment you have established it. To be safe against perils that are better understood than explained, you have but to adopt as the foundation of the business that the edifice shall be used only for such purposes as consist with the advancement of science, art, and literature, and all the rest will turn on management. *Shirley Hibberd, Kew, January 21, 1890.*

THE SELBORNE SOCIETY.—The objects of this Society are stated to be, to preserve from unnecessary destruction such wild birds, animals, and plants as are harmless, beautiful, or rare; to discourage the wearing, and use for ornament, of birds, and their plumage, except when the birds are killed for food, or reared for their plumage; to protect places and objects of interest or natural beauty from ill-treatment or destruction; to promote the study of natural history. The Society intend to publish a monthly periodical called *Nature Notes*, and devoted to natural history in general, and to the purposes of the Society in particular. The Rev. PERCY MYLES and Mr. JAMES BRITTON are to be the editors of the magazine, which has our hearty sympathies and good wishes for the success of each and all of its aims.

OPEN SPACES AND THE BUILDERS.—The President of the Royal Academy has given welcome and weighty assistance to the movement for the preservation of open spaces in a letter to the Editor of *The Richmond and Twickenham Times*, who is one of the Vice-Presidents of the Lower Thames Valley Branch of the Selborne Society. Sudbrook Park, which joins Richmond and Petersham Parks, Petersham village, and Ham Common, is in the market for building purposes. The vendors are the Commissioners of Woods and Forests. The Thames Valley Branch of the Selborne Society is about to memorialise the Government to dedicate the park to the public use and enjoyment. Sir FREDERICK LEIGHTON earnestly wishes them success, and says:—"Your lovely park, with its wide wild spaces, and its sweet fresh air, is, and is daily more and more becoming, a priceless possession to the inhabitants of this black and monstrous metropolis; and it is so in its most frequented parts, perhaps in grand measure from the fact that Sudbrook Park shields it as a bulwark against smoke and bricks and mortar. I sincerely trust it may never lose that protection, for I feel that the breaking down of this barrier would have most mischievous results in many ways. I think public opinion will be warmly in your favour, and will strengthen your hands. Certainly my very best wishes follow you in your present endeavours."

EALING DISTRICT GARDENERS' MUTUAL IMPROVEMENT SOCIETY.—On one of the recent weekly meetings of this Society, an interesting paper was read by Mr. RICHARD DEAN, entitled the "Romance of Plants," which appeared to be appreciated by the members as being in subject-matter a change from the papers of a practical character usually read at these meetings.

A YEAR'S TRADE.—As every reader of this journal is in one way or another interested in our monthly stock-taking paragraph, it is a natural conclusion that the presentation of a summary of the year's trade must be at least equally interesting. No better idea of the vastness of British trade can be gained than the following figures present, and one rises from a perusal of them with a feeling of wonderment and pride. Our survey is, of course, naturally limited, but the eye of the Briton must rest with pardonable pride, for a moment, on the line containing

the "total values," in the short table appended, which contains extracts from the "summary of the imports of produce from foreign countries and British colonies for the year ended December 31, 1889"—

	1888.	1889.	Difference.
	£	£	£
Total value of imports	286,582,936	477,210,830	+190,627,894
II.—(A.) Articles of food and drink—duty free ...	124,231,097	134,869,525	+10,638,428
(B.)—do., dutiable ...	24,358,798	26,210,774	+1,851,976
VI.—Raw materials for textile manufactures ...	80,468,675	91,307,086	+10,838,411
VII.—Raw materials for sundry industries and manufactures ...	38,722,501	43,694,671	+4,972,170
IX.—Miscellaneous articles ...	14,018,458	14,697,133	+678,675

There was only one instance of decrease to note—in metals and that amounting to only a few thousand pounds; and it ought to be recorded here that the above totals are exclusive of the value of the imports for the parcel post. In 1888 the value of such imports was £368,776; and in 1889, £374,612. The exports for the year constitute wonderful items in these returns; the following extracts will certainly interest even the most general reader:—

Extracts from the Summary of the Exports of British and Irish Produce and Manufactures.

	1888.	1889.	Difference.
	£	£	£
Total value of exports	233,842,467	248,091,959	+14,249,492
II.—Articles of food and drink ...	10,238,121	10,718,662	+480,541
III.—Raw materials ...	13,979,881	17,337,920	+3,358,039
IV.—Articles manufactured and partly manufactured, viz.:— A. Yarns and textile fabrics ...	108,579,150	110,210,484	+1,631,334
F. All other articles, either manufactured or partly manufactured ...	39,989,042	33,973,187	-6,015,855

Exports of Foreign and Colonial Produce.—Total value (partly estimated), 1888, £34,042,629; 1889, £34,859,775; +£817,146.

A few interesting sums in arithmetic may be derived from these gigantic totals; thus, the value of goods all round being taken at £10 per ton, divide the totals therewith; then, taking the average storage capacity of our ships at 1000 tons, to find the number of ships employed in our carrying trade. Then you go to the amount of insurances effected, and then—but where to stop?

PINUS PALUSTRIS.—The tops of young Southern Pines (*Pinus palustris*), from Georgia or Florida, were, says *Garden and Florist*, conspicuous objects in the shops of New York florists recently. Stems of young, vigorous saplings, 4 or 5 feet long, with the terminal cluster of leaves, are cut and stuck into flower-pots filled with earth. As the leaves remain fresh for a considerable time, the cut stem has every appearance of a living plant. The long, bright green leaves and the white scales of the large terminal bud, which are peculiar to this tree, make the young plants ornamental and attractive objects, well suited for the decoration of churches—for which they are used principally in this city—or other large buildings.

THE LATE MR. BREBNER, OF WINDSOR.—This gentleman, who for many years was Her Majesty's bailiff at the Norfolk Farm, Windsor Park, and whose death took place on the 13th inst., at the advanced age of eighty-five years, was in early life a gardener. We learn from a correspondent, Mr. W. TRENLEN, of Feltham, who went into the gardens at Marelands, just below Farnham, Surrey, in 1840, as a youth, that Mr. BREBNER was at that time the

head gardener, having been in the place several years. About 1846, Mr. BREBNER left to take the position of gardener and bailiff at Bagshot Park, and later was transferred to the important post of bailiff at the Norfolk Farm, in Windsor Great Park. It may not be generally known that another gardener, formerly well known in West Middlesex, Mr. PEEL, who was for several years at Cambridge House, Twickenham, holds an important post in Windsor Park now.

FORCED HOLLY.—Some of our readers may smile at this heading, yet what we have to say will show that the thing is feasible. Some sprays of Holly with berries were cut for Christmas decoration, and placed in a vase of water. The berries occupied the centre of the shoot, the upper part being decked with leaves and flower-buds. The flower-buds, however, were not observed until the leaves fell off, when the buds rapidly developed, so that in the specimens before us the upper part of the shoot is now thickly covered with tufts of white flower-buds; each bud is of the size of a small shot, creamy-white, as also is the stalk supporting it. The tufts of buds thus form a marked contrast to the crimson berries. It seems hardly likely that the flowers on these particular specimens will expand, but under other circumstances it is clear they might do so.

WARE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—A meeting of this Society was held on the 13th inst., the Rev. A. E. W. LORRIS in the chair. There was a good attendance of members present. Some excellent plants were staged, comprising *Primulas*, *Ferns*, *Roman Hyacinths*, and *Primula obconica*, also some bunches of Lady Downes' Grapes. A paper was read by Mr. H. A. SMITH on "Adiantums." The essayist illustrated his paper with living and dried specimens.

PETER HENDERSON, OF NEW YORK.—Our correspondent in New York telegraphs to us the announcement of the death of Mr. P. HENDERSON, nurseryman, of that city, on the 17th inst., of pneumonia. Mr. HENDERSON went to the United States more than a quarter of a century ago, and engaged in market gardening for a time, but afterwards deserted that for a general nursery business, with offices and warehouses at 35 and 37, Courtlandt Street, New York, and where he amassed a very large fortune. We hope shortly to give a fuller account of his life.

BRUSSELS CHAMBER OF HORTICULTURE.—The close of the first session of this Institution was celebrated by a banquet given on the 7th inst. in honour of M. LUCIEN LINDEB, and in recognition of his services to the Institution. MM. VANDERMEULEN and GILLESSENS in toasting the "hero of the fete," alluded to his personal qualities, and to the good service he has rendered to horticulture.

"THE ROSARIAN'S YEAR BOOK."—With a portrait of Mr. R. N. G. BAKER, by way of frontispiece, this annual makes its wonted appearance. It is full of gossiping narrative dear to the rosarian mind—a summary of the year's proceedings, among which Rose jottings, by Mr. A. H. GRAY, may be mentioned as particularly interesting. At the time of the SHAH's visit in the past summer, regret was expressed that he did not visit the Rose Conference at Chiswick, whereas one of the most interesting exhibits was the simple-leaved Rose, *A. berberidifolia*, and one of the most characteristic of his Majesty's floral subjects. Seeing the confusion occasioned by his Shahship's visit to the Crystal Palace on the occasion of the National Society's show, there is, however, rather reason to congratulate the Chiswick Conference that his Majesty did not honour it with his presence. Mr. GRANT tells us an amusing story how, in 1863, he was in Teheran, and was presented to the SHAH, but sickness overpowered him in the august presence of the SHAH himself, and he had to retire summarily, when the Persians standing by

exclaimed, "Behold the sight of the King of Kings has well-nigh killed the infidel." Little did that infidel then think that the next time he was to see the King of Kings would be at a Rose show in merrie England. Mr. MAWLEY's summary of the weather from a cultural point of view is, as usual, of great value.

READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—The first annual meeting of this Association was held on the 6th inst. Mr. J. POOD, jun., read the annual report, which stated that the Association numbered 120 members. Fourteen meetings had been held during the year, and had been well attended. The Committee wished to thank Mr. A. STURTON for his kindness in granting the use of the room for meetings, those who had contributed to the success of the meetings by reading papers, and by exhibiting plants and various other produce, and those who had helped financially. The financial statement showed the receipts to have been £27 17s. 6d., and the expenditure £10 5s. 6d. At the opening meeting of the Association next session, Mr. WILKINSON will read a paper on "Grapes."

FLOWERS IN SEASON.—We have seen recently some flowers of a fine large strain of Chinese Primula grown by Mr. W. BELL, New Plant Nursery, Chelsea, in which the colours were vivid and decided. The so-called blue was of a very deep hue, and the crimson and scarlet varieties excellent. The apparently finest novelty was one named *oculata lutea*, a flower with a large octagonal eye of a greenish sulphur tint, the lobes being white, spotted and flaked with crimson. The margin was boldly frilled. We cannot speak of the habit of the plants, flowers alone being observed. Some *Bulbocodium* Narcissus grown thickly in pans have been sent for our inspection by Mr. T. WAKE, Hale Farm, Tottenham. Pretty things grown and flowered with little or no forcing, early potting being the chief secret of getting the bulbs to flower early. These slender plants always seem to want a carpet of something to spring from—say of Saxifrage, living moss, or the almost hardy *Selaginella denticulata*: some seeds of dwarf grass sown at the time of potting would be better than the bare mould. Has anyone tried these in water like the *Fazetta* Narcissus mentioned recently in these pages?

CHINESE GARDENS. Moving onwards, says the Hon. LEWIS WINSFIELD, in his recently published book, *Wanderings of a globe Trotter*, the traveller finds himself in a garden, with two or three small houses and some kiosks dotted among the foliage. Each house, it was explained, is for the use of a branch of the family, so that all may dwell together, and yet be in some sort independent. The garden is cut up into various levels by a tortuous and labyrinthine rockery, made of clinkers and pieces of rough stone, varied by pools and canals, or, rather, puddles and gutters of dirty opaque water. There is no attempt at lawn, or sward, or flower-bed. Flowers there are, and beautiful ones, in pots, and some of the shrubs bears blossoms. The landscape gardener seems to have set himself the task of seeing how many ups and downs he could introduce, how many funny little bridges, and passages leading nowhere. There is a kiosk at the extreme end of the pleasure-ground, poised on a height, in which is a valuable collection of vases of the Ming period, dusty and neglected. To arrive at this kiosk, it is necessary to cross at least half-a-dozen bridges, and to make as many *détours* on a space of ground which you should be able to cover in a dozen steps.

GARDENERS' ROYAL BENEVOLENT.—Our notice of the annual meeting of this Society last week was written when the meeting was still in progress, and before it was brought to a pleasant termination by a "friendly dinner." The Committee and the members had honestly won their right to enjoy them-

selves, and this, under the genial Chairmanship of Mr. EDMUND YATES, they managed to do. Nor were they so ungrateful as to omit their tribute of gratitude to "CUTLER." Alike at the formal and at the friendly meeting, the extraordinary services of the irrepresible Secretary were warmly—but by no means too warmly—acknowledged. Anyone who will take the trouble to read what we published last week, as to the progress of this institution, especially during the last year, must be struck with astonishment at the amount of success which the Secretary, though now in his fiftieth year of service, achieved in promoting the interests of the Institution.

RAILWAY RATES.

ON Monday last a representative meeting of the trade was held at the Hotel Windsor, Victoria Street, Westminster, to hear from the Secretary to the Nursery and Seed Trade Association a report on the progress of this inquiry, and to decide on what evidence should be given on behalf of the trade before the inquiry. Mr. John Harrison (Leicester) occupied the chair. He said that the present day was one eminently for trade combination, especially when trade interests were so seriously attacked as in the present instance. The powers possessed by the railway companies were very great, and their importance could be gathered from the fact that over 300 Acts of Parliament had been obtained by railway companies which possessed a mileage of 20,000 and a capital of £345,000,000. The object of the opposition which was being carried on was not so much to reduce the present rates as to prevent the railway companies obtaining the power to charge 20 to 50 per cent. more than they now did. With reference to "smalls," and the constitution of a "perishable merchandise class," he congratulated the meeting on the progress which had been made in favour of traders, and referred to the original claim of the railway companies to charge whatever they thought proper for the former. The question of terminals was a difficult problem to solve. When a tradesman's business increased so that he had to enlarge his premises, he did not charge his customers with the cost, but this is what the railway companies were endeavouring to do, and that, whether the accommodation was required or not. He appealed to the trade to show, by their united action, that they did not intend to allow their interests to be injured.

Mr. Goodchild, the Secretary of the Association, reminded the meeting that when they met on May 11 last the matter was in its infancy, and no one could then tell what procedure would be adopted. The inquiry had by this time settled down into something like regularity, and so great was the progress made, that although the case for the railway companies had not yet been fully opened, nearly 12,000 questions had been asked and answered, besides numerous speeches made by counsel. The question resolved itself into three branches:—(1) classification, (2) rates, and (3) terminals. The second and third were of interest to all traders alike, whereas the first affected traders individually. It depended on the class in which an article was placed what rate would be applicable thereto, and it was upon this branch of the question that evidence would be required to be given, and considerable attention would have to be given to it. When once this was definitely settled, they would have the united opposition of all sections of traders to the amounts of rates proposed as maxima. He quoted from the evidence given at the inquiry to show the reasons alleged by the railway companies for naming such high rates, whilst they professed their intentions of never charging them, and pointed out the danger which traders ran if rates, admittedly unreasonable, should ever be sanctioned. After he had referred to various matters in connection with the inquiry, and suggested the course to pursue, the discussion was continued by Mr. William Paul, Mr. G. Bunyard (Maidstone), Mr. W. C. Slucock (Woking), Mr. John Perkins (Northampton), and Mr. Poupart (Twickenham), and the following resolutions were carried:—"That

this meeting, representing the nursery and seed trades of the kingdom, having heard the report of the Secretary to the Nursery and Seed Trade Association on the progress of the Enquiry now being held, hereby confirms the action taken by him, and instruct him to do all that is necessary with a view to protecting the interests of the trades, and also to instruct the solicitor to the Association to employ counsel before the inquiry."

"That this meeting urges upon all the members of the trade the necessity of contributing to the guarantee fund for the purpose of meeting the expenses consequent upon the opposition to the increasing of railway rates and charges."

"That this meeting stand adjourned until February 11 next, or to such earlier date as the Secretary in his discretion may think necessary."

A vote of thanks to Mr. Harrison for presiding at the meeting concluded the business.

THE KITCHEN GARDEN.

ASPARAGUS.—Where a supply of Asparagus is in demand from the end of the year, it is necessary to make new plantations annually, and for forcing purposes it is not essential that the land should be so thoroughly prepared, as if permanent beds were intended to be planted. It should, however, be dug deeply and manured heavily with farmyard dung in a decayed state, and if it be light and well drained naturally, the young plants should be planted on the level at the proper time, or seed be sown in due season. Heavy or wet soils should, however, be well drained and deeply trenched, mixing in abundance of road scrapings, half-decayed manure, and rough rubbish heap stuff, and the beds should be raised several inches above the ground level by throwing out alleys of 2 feet in width, the beds being 1 foot in width. If the land has not yet been prepared, there should be no delay in putting it in readiness.

Onions.—The ground for the main Onion crop should be deeply dug and well manured, the surface being left in a rough state; and where the maggot is troublesome, give the surface a dressing of fresh soot occasionally, before finally preparing it for seed sowing.

Hotbeds for Potatoes, Carrots, &c., should be made up, taking care to make them as firm as possible, and when their warmth has begun to increase put in the soil in ridges, but leaving the planting of Potatoes and the sowing of seeds until the heat has declined to a safe point. Early Nantes is one of the best of the early Carrots for frame purposes. Potatoes which were planted in the early part of the present month should get ventilation in favourable weather to secure sturdiness of growth, but the operation must be cautiously done, and in quantity according as the outside temperature is mild or otherwise. If the soil should get dry, afford tepid water, but on dung beds the soil will require no water for some time to come. Carrots now coming up will demand such attention as regards airing the frame, covering up at night, keeping the glass clean and stirring the soil between the rows. Thinning should be done early, otherwise crowding will ensue, and the plants become drawn and weak. Leave a chink of air on at night, to let out steam, and thus prevent damping. The temperature in these hotbeds need not exceed 50° at night with air.

Mustard and Cress should be sown at intervals according to the demand, and sowing may be made in shallow boxes of light sandy soil, which should be pressed firmly, and a piece of board or slate put over the seed till it germinates. The boxes may stand in any house that is being forced, and removed to a cooler one as soon as the plants are fit for use. Chicory may be put into the Mushroom-house or a darkened frame, or, indeed, in any place having a temperature of not more than 60° and that is quite dark. A sowing of Lettuce to be cut or pulled when quite young will afford a grateful change in salads.

Hotbeds.—In most gardens a fresh planting should be made annually, and the earlier in the year this is done the finer will be the roots at the end of the year. The ground for the crop should be deeply trenched, and enriched with well-decayed manure put at the bottom of the trenches, the pieces being planted at 14 inches apart each way. The sets may be straight pieces 10 inches long, and furnished with a crown. After letting the ground settle, tread it lightly when dry on the top, make holes with a dibbler, push in the pieces to the bottom, and fill up the holes with some fine soil, making all firm. H. Markham, *Mereworth Castle Gardens, Maidstone.*

HOME CORRESPONDENCE.

HELLEBORUS NIGER V. ANGUSTIFOLIUS.—The fine variety of Christmas Rose alluded to by "R. P." on p. 87 of your last issue under the above name is not, I believe, the plant made famous years ago by the late Miss Hope, of Wardie Lodge, Edinburgh, and named *H. niger v. angustifolius* by the late Mr. James McNab of the Edinburgh Botanical Garden. The Manchester plant has been largely distributed of late years by Messrs. Clibran & Son, and is, as your correspondent says, a very handsome plant. Grown in detassé moist sandy peat, it is one of the very best of Christmas Roses. The true *H. niger angustifolius* of McNab is a plant now known as *H. niger intermedius* (= *H. n. scoticus*), a variety with red-dotted leaf petioles and flower stems, whereas the Manchester variety like the "St. Bridg" Christmas Rose of Ireland, has stems of a pale apple-green tint, without any red dots whatever. "R. P." is quite right in recommending *H. altifolius* (= *H. n. maximi*) as the best Christmas Rose for cold or heavy soils, but the Riverston variety runs it very closely, being very vigorous, and producing whiter flowers; those of *H. altifolius* being generally rosy tinted behind the sepals, i.e., rosy in bud. Some imported wild *H. niger* from Italy are very free and floriferous, as also is the French garden form known as Madame Fourcade, but one of the most distinct is Ware's *H. niger rubra* (Apple Blossom), which has narrow dark green leaflets and delicate rose-tinted flowers. Mr. Walter Ware grows large quantities of a very fine variety, free and profuse in its snow-white flowers, under the name of Bath Major, and there are now numerous fine garden seedlings which will be much appreciated when better known. Max Leitchin has sent me several very fine seedlings, one of which begins to bloom in August, or six weeks before *H. altifolius*, which was before this our earliest Christmas Rose, flowering in October. I saw a batch of fifty fine seedlings flowering for the third season the other day, and some of them are very beautiful and distinct. We have a good many seedlings here, and find that they bloom at from twelve to twenty months after germination, so that one has not very long to await results; as well grown in deep moist peaty or loamy soils in full sunshine, but with shelter from rough winds, but few winter-blooming evergreen plants can compete with the hardy Christmas Roses. Two years ago I made a collection of twelve or fifteen varieties, and from these plants we have this season gathered thousands of fine blooms, from the shelter of frame lights overhead only, some nearly as pure as *Eucharis* blooms. We also had a few hundred imported roots collected in Austria, and among these there are some distinct forms, probably natural seedlings, at any rate far superior to the common old *H. niger*. There is just now a large demand for well-grown plants of the choicest variations of this species, and it is likely to be a growing one. *F. W. Burbidge*.

THE SILVER LEAF DISEASE OF PLUMS.—At the end of the summer one often observes on walls and Orchard trees, branches on which the leaves have become whitened, as if milk had been poured over them. It is a very unhealthy symptom of a disease peculiar, so far as I know, to the Plum, Cherry, Portugal, and other Laurels, Apricots, Almond and Peach, and affects the death of the affected branch, and often of the tree or bush. The disease appears in various localities, and under quite different conditions of soil, elevation, and exposure. It is probable that it is of fungous origin, the fungus causing this disarrangement of the sap vessels, for on examination of the roots of two standard Plum trees two years ago, I found the root knotty, and of a foxy colour—a sure indication of disease. These roots were carefully cut away, the cuts dressed with the knife, the branches which showed signs of sickness being cut back, and the wounds sealed over. The soil was taken away and burned, fresh soil being placed around the trees, and now these are vigorous, and show no symptoms of former sickness. I operated in the same way on a fan-trained Victoria, 18 feet diameter, on a north-east wall, but less successfully, owing, I think, to my not having taken measures in time. On this tree the diseased branches were cut out annually, but nothing further was done. After operating on this, as previously mentioned with the standards, the side which was denuded of branches broke away very strongly, but gunning set in, which seemed to show that the roots were not

capable of sustaining it when the diseased sections of the tree were examined. Only a very small portion of wood or bark was found to be quite sound. If the leaves on diseased branches are dissected, it will be found that the skin is separated from the inner tissue. This, I conclude, is brought about by shrinkage of the green chlorophyll cells possibly from defective nutrition. I have come to the conclusion that once a tree is seriously attacked by silver leaf disease, the case is hopeless; but on the other hand, if taken in hand when the first symptoms show themselves, the trees lifted, roots pruned and dressed, and fresh soil added, the trees will be restored to health. This overhauling of the roots should be done in early autumn. *A. Evans, In the Hill, Haslemere.* [We have never detected any fungus, and a far more competent observer, the late Rev. M. J. Berkeley, was, as we know, equally unsuccessful. En.]

THE EUCHARIS (BULB) MITE.—That plants infested with the insect known generally as the bulb mite may be cured I am convinced, for in two instances plants under my care which were infested when they recovered their healthy appearance. When I took charge of these gardens, the *Eucharis* (of large pots) were greatly suffering from the insect, some having no leaves and others only four or five; but now they are growing vigorously, sending up flower spikes. The plan I adopted was to shake out those bulbs which were without roots from the soil, the outer scale of the bulbs being removed. I then took powdered unslacked lime and fresh soot, in equal quantities; and the bulbs after being washed thoroughly in warm water were rolled in this mixture. Those bulbs with roots had the soil carefully picked out from amongst them, were washed like the others, and then dusted over with the mixture. They were all of them potted in good loam, peat, and a little charcoal, only burying them just beneath the soil. After the potting was finished the pots were watered with warm water, and plunged in a bed of leaves in a warm house, and in watering them afterwards, manure was not afforded. I believe these bulbs are now quite free from the mite. The *Eucharis* suffers from attacks of mite as a result of improper cultivation. Sometimes the bulbs are allowed to remain in the soil until the pots become crammed with offsets and roots without any additional soil or pot-room being afforded, and in that state they are supplied with strong manure water which may and often does tend to render the soil unfit to support plant life. The roots then decay and the bulbs become diseased, soon forming in that condition a ready prey to insects. *W. H. Stephens.* [The mite is common on other bulbs, and is not found only on the *Eucharis*.—En.]

THE GARDENERS ORPHAN FUND.—Mr. Deal invites practical suggestions as to the point raised by "G." in connection with the investment of so large a sum as £225 in the funds, whilst orphans accepted by the committee as deserving cases for the fund are left uncared for. At the first election of orphans, ten were nominated and six elected, although five others were eventually put on the fund. Last year, out of fourteen candidates, only five could be elected, and nine were sent away empty and disappointed; yet the committee had all this sum resting in the bank at the time. It is true that through a special effort later a sixth child was put on the fund last year, but still eight remained out in the cold. Is it the duty of the present generation to provide for its own orphans, or for those of the next generation; or shall each generation provide for its own? That is the problem for the committee to solve, and I hold that as long as there remains one accepted candidate unprovided for, the burden lies with the apologetes for the funding principle to show the reason why Mr. Deal is strong upon having a reserve fund. What for? The committee have not a penny of responsibility beyond any one year. They have no costly institution, no staff of officers, no burden of any kind, beyond the orphans' weekly payments, and the responsibility for those continues only so long as funds are forthcoming, and those will come all the readier that it is shown that the committee are spending their income for the maintenance of the orphans of our friends and fellow gardeners, and are not hoarding it up for the benefit of generations yet unborn. Let the committee remember how, in the past, trust funds have proved to be either curses to those originally intended to benefit, and have been easily misappropriated or misapplied. If we spend as we go, we shall leave nothing to promote corruption, besides which we shall care for our little ones, and leave the future, which every year shows is becoming

richer and richer, to care for its orphans. But as a "practical suggestion" I invite the committee at the next general meeting to enable discussion to be raised upon rule 5, to which Mr. Deal draws our attention; and permit amendments to it to be submitted. If that were the case, I should be prepared to submit an amendment of the rule, inserting just before "all donations," the words "subject to a deduction of 25 per cent. to be applied to ordinary expenditure." All donations and legacies shall be invested, &c., omitting all reference to any portion of the annual subscriptions being invested, because no such clause should exist so long as there were more orphans nominated than could be elected. When the income from annual subscriptions exceeds the demands upon the fund, then some method of otherwise applying the surplus may be considered. The 25 per cent. should go a good way to help maintain several orphans, instead last year's deduction should have been some £250. *Mr. Dean.*

A PRECOCIOUS NUT TREE.—So early as January the 10th, I found here a Nut tree, literally in full bloom. It is a chance seedling, some ten years old, and growing in rather cold soil, so that this precocity is not induced by soil or situation. Close by are some Kentish Filberts, but these bid fair to be some two or three weeks later. Neither tree has a catkin upon it, whilst my seedling tree is full of these, and in the bright sunlight they glow with a golden hue. The absence of catkins in the Filbert bushes is unpromising, but still we have plenty of evidence that female flowers may become fertile when pollen is absent. [Will our correspondent please explain? En.] The later catkins on the seedling Nut may, however, furnish ample pollen, as the bush is but a few yards from the others. I should like to learn whether the comparatively mild winter is making Nuts to bloom unusually early everywhere; or whether it is not uncommon for some bushes to bloom freely as early as the 10th of January. It is true the prevailing mild weather may serve to fertilise the flowers, and perhaps prove more propitious in January than it will be in February. I have been looking over a short essay upon Filberts in a fruit book, and failed to find in it any mention of the blooming period. Probably it varies considerably according to season. The female blooms are large and rich coloured; the catkins are fine also, so that evidences so far as they go are in favour of good fruit production. The late hardy fruit agitation has taken little notice of Nuts, and yet there is considerable profit attached to them if the soil and situation be fitting, and the trees are properly pruned and cultivated. It is not essential that chalk should be the subsoil, they will do well on clay and gravel if good cultivation be given. It is chiefly in Kent where very high cultivation is afforded, as in ordinary gardens Nuts are grown as free bushes. The fruit on the latter, however, is less valuable. *A. D.* [The earliest date cited in Roberts' *Naturalist's Diary*, p. xix, is January 14, for the common Hazel. The average of ten years from 50 localities, being January 27. En.]

ROYAL HORTICULTURAL SOCIETY.—I read the notes on the Committees, especially on the Floral Committee, as they appeared in your paper, and determined to take no part in the discussion, for having retired from the Floral Committee and its chairmanship, I have no longer responsibility; but as Mr. Dyer (page 85) goes back to the reasons for the introduction of compulsory fellowship, I should like to state, as shortly as may be, the reasons why I and those who thought with me objected to this. I look upon the work of the Committees as the most valuable part of the society's operations, and as affording the best ground on which to ask new fellows to come in, and I think therefore that they should be as efficient bodies as possible, not only as judges, but also such as will command the confidence of the country, and that therefore they should consist of a fair proportion of amateurs, nurserymen, and gardeners, thus representing all classes of horticulturists, allowing the exhibits to be considered from all points of view, and preventing ill-natured remarks, such as were not uncommon some years ago, as to the preponderating influence of some great London firms and authorities. To get the best Committee it is desirable to have as large a number as possible to choose from. A very large acquaintanceship with gardeners of all classes makes me, I am sorry to say, know that there are really valuable men, not only professional, but amateurs, to whom a guinea subscription, in addition to other calls upon them, is what they cannot afford, and others who object to the

demand. I think if the society gets first-class unpaid judges to give their time and pay their own travelling expenses, that a complimentary admission ticket is well earned, and that it is shortsighted policy trying to get extra fellows by making the members of the committees subscribe. As a matter of fact, the Committees lost some good members who attended, on account of the compulsory fellowships. *George F. Wilson.*

— I ask permission to make a few remarks on one or two points in the Rev. W. Wilks' communication

these nominations were made openly at the last meeting in the year. Nothing of the kind happens now. Mr. Wilks states that a special ticket was supplied to the members of the Committees. It is a singular fact that while I have heard of only some two members of the Floral Committee who received this ticket in 1889, I know several—myself among them—who never had it. One member informed me that he received the ticket only on making application for it through a member of the Council. Considering that many members of the Committee come

subject. The annual meeting will afford an opportunity for its full discussion. *Ed.*

LILY OF THE VALLEY FOR FORCING.—Which are the best, English or Continental grown crowns? This is a question frequently put, and having forced the English grown crowns for some five years, I must say, that in my experience, they are more generally reliable than those from the Continent. I enclose a photograph of a pot of Lily of the Valley—English—just as they turn out from the forcing frame, and we put about twenty-five crowns in a 48-pot, and it will be seen that there are very few faulty ones amongst them. I may add that our crowns are got from Jannoch's Lily Nursery, Dersingham, *W. Harrow.* [Very good potful. No need to buy from the foreigner when such excellent roots can be grown here. *Ed.*]

BIGNONIA RADICANS.—One of the best plants of this climber that I have seen, is growing in the garden of Mrs. Smith, The Oaks, Emsworth, and is trained up the corner of the kitchen garden wall, which has a southern aspect. The plant is about 10 feet high, and flowers very freely every year, and makes vigorous shoots. The soil is light and sandy. *E. M.*

PYRUS HETEROPHYLLA.

This new plant (fig. 18) from the high mountains of Eastern Turkestan is not to be confused with the older *P.* (*Sorbus*), *heterophylla* of gardens, which is a bastard of *S. arbutifolia*, and *S. aria*. The plant was discovered by Albert Regel, who sent fertile seeds to Dr. Dieck of the Zoesehen arboretum. The plants grew well, but have not yet borne flowers, so that the proper position of the species has yet to be determined. The plants raised from this seed show great variety of form in the leaves, some of them having leaves that are smooth at the margin; others are slit and almost of thread-like form; but the majority exhibit forms intermediate between these two extremes. If in stature the tree should reach to the height of the Mountain Ash, or other tree-like *Sorbus*, an acquisition of considerable value will have become available to the landscape gardener. The tree having proved hardy in Northern Germany, will succeed in any part of these islands. We are indebted to the courtesy of Dr. G. Dieck for the illustration.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

JANUARY 14.—Present: D. Morris, Esq., in the chair; and Professors A. H. Church, H. Marshall Ward, Drs. Hugo Müller, M. T. Masters, Messrs. G. F. Wilson, W. H. Blandford, R. McLachlan, F. Pascoe, and Albert Michael.

Scaley Roots.—Professor Ward reported that the specimens submitted to him at the last meeting were affected with the slime-fungus (*Plasmodiophora*), a fungus which does great damage to the roots of Cruciferous plants.

Canker in Apple Trees.—The same gentleman reported on the specimens referred to him at the last meeting, but which presented no unusual features.

Acari of Sugar-cane.—Mr. Michael reported on mites affecting Sugar-canes in Barbados. Contrary to anticipation, the acaroids belong to the family Oribateide, and either to the genus *Notaspis* or to *Damaeus*, having the appearance of the former, while the internal anatomy is more like that of the latter genus. The species is allied to the English *N. lacorum*, but is probably undescribed. The creatures in question are strictly vegetable feeders, but have not hitherto been considered as inflicting any material damage to living flowering plants, being found more particularly on moss and lichens. Mr. Michael recommended that specimens of the infected cane slightly moistened, with the living *Notaspis* on them, should be put into a tin box, sealed down to prevent drying, and thus forwarded in a suitable condition for further examination; other Acari, of the genus *Tarsonymus*, and of extremely minute size, are known to be injurious to

FIG. 18.—PYRUS HETEROPHYLLA.

of January 11. He states that "many" of my assertions are utterly groundless. Let us see. By a "tax," I meant that no person can now sit upon the Floral Committee unless he first becomes a Fellow of the Society. From the very first establishment of the Committees of the Royal Horticultural Society down to the end of 1888, the Council did not insist upon a Fellowship being an indispensable qualification to a seat on the Floral Committee. Not a few members of the Committees have to come from a distance, to bear the expense of travelling, and in some instances, to lose a day's business, in order to attend the meetings. The privilege of nominating to vacancies on the Committees did undoubtedly exist as you stated in your editorial footnote, and

from a distance at their own expense, I think the privilege of a modest luncheon was one honourably obtained. It had certain social advantages; one was that it tended to hold the members together until later in the day. Now the great bulk of the members disperse as soon as the labours of the Committees are over, and a sense of desolation prevails in consequence. It is the general custom with horticultural societies to give a luncheon to their judges, even when they pay them a fee. In the case of the members of the Committee at the present time, not only do they not partake of the hospitality of the Council as of old, but they actually have to pay to sit on the Committee. *R. Dean, Eding.* [We think enough has now been said on this

Sugar-cane. The species of *Dameus* are found under the bark of trees. Judging from analogy only, the mites in question would not seem likely to do much injury to living canes.

Dactylopius (Woolly-bug).—Referring to a communication made to the committee on December 10, Mr. Morris now read a letter from Professor Riley on the use of resin washes for bark-lice. "If," says Mr. Riley, "the insect is a *Dactylopius*, the Alexandrians cannot do better than use one of the resin washes with which we are spraying *Acacia* so successfully in California." The following extract from *Insect Life* contains a good formula for the purpose:—

"Rosin Wash for Red Scale.—In accordance with instructions, Mr. Coquillett has been making experiments with this wash against red-scale (*Aspidiotus aurantii*), and after twenty different tests made with various preparations, from July 17 to August 8, the one which gave the best results was found to be composed of rosin, 20 lb.; caustic soda (70 per cent. strength), 6 lb.; fish oil, 3 lb.; and water to make 100 gallons. In preparing this wash the necessary materials were placed in a boiler and covered with water, and then boiled until dissolved, and stirred occasionally during the boiling. After dissolving, the preparation was boiled briskly for about an hour, a small quantity of cold water being added whenever there was danger of boiling over. The boiler was then filled up with cold water, which mixed perfectly well when added slowly and frequently stirred. It was then transferred to a strong tank and diluted with water to 100 gallons. Neither the leaves nor the fruit was injured, while a large proportion of the scales were destroyed. Those which escaped were either on the fruit or the underside of the leaves. The cost of the wash is 80 cents per 100 gallons, or four-fifths of a cent per gallon. An Orange tree 16 feet tall by 14 feet in diameter was given 14 gallons. This, however, seems to us to be an unnecessarily large amount, but upon this basis the cost of spraying per tree is 11 1/2 cents." From *Insect Life*, Oct., 1889, p. 92, U.S. Department of Agriculture.

The Winter Moth.—Mr. Wilson called attention to a communication in the *Hereford Times* of November 9, 1889, as to the efficacy of greased bands as a check to the insect, and wherein Mr. Cranston says:—"I consider that the greasing process which is being adopted is injurious to the bark of the trees, especially to young trees. To the older trees it may possibly not do much harm, but I believe the old plan of painting the trunks of the trees with a solution of quicklime is the best. Some use soot with the lime, but I don't know that the soot is of much consequence except to dull the white glare of the lime. The painting should be done in the autumn."

Mr. McLachlan pointed out that the proposed trap to be affixed to the lamp-posts, in the case of suburban fruit plantations, would be practically useless, as only the male insects would be thus captured, the females being nearly destitute of wings, and incapable of flight. All attempts at stamping out the winter moth should be directed to the destruction of the females, which are capable of depositing eggs for many generations in succession without the intervention of the male. The capture of myriads of males would not have the slightest appreciable effect on the fertility of the untrapped females.

Monstrosus Cypripediums.—Dr. Masters showed drawings of two *Cypripediums*, in one of which the three sepals were separate, as in most *Orchids*, whilst in the others there was an adhesion between the median sepal, the lateral petal on the left side, and the lateral sepal on the same side, the adhesion of these parts being accompanied by corresponding adhesion of the labellum to the right lateral petal. The median stigma, G, I, of the Darwinian notation, was also petaloid.

Keteleeria Davidiana.—Dr. Masters showed a cone sent by Dr. Henry to Kew, from Ychang, and which has special interest as being intermediate in character between the Spruces (*Picea*) and the Silver Firs (*Abies*). It is congeneric with *Keteleeria Fortunei*, a tree introduced to this country from China, but which is too tender for general cultivation.

It was announced that the next meeting will be held on February 11, after the annual meeting, and therefore, possibly, a little later than the usual hour, 4 P.M.

EDINBURGH BOTANICAL.

JAN. 9.—The Society met in the evening on the above date at 5, St. Andrew Square, Mr. Lindsay,

President, in the chair. Professor Bailey Balfour gave a preliminary notice of the new Marine station instituted by the Scottish Fishery Board at Dunbar, where biological observations on plants, as well as on animal life, are to be prosecuted, and thus introduced a paper on the "Marine Algae of Dunbar," by Mr. G. W. Traill. Dr. G. M. Macfarlane then gave a communication, "On the Structure and Development of the Glands of *Nepenthes*."

The following are the weather reports for the month:—

"Report for December, 1889, on Temperature, at the Royal Botanic Garden, Edinburgh," by R. Lindsay, Curator.

Like the preceding month, December has been remarkable for the extreme mildness of weather which prevailed. The thermometer was at or below the freezing point on eighteen occasions, the aggregate amount of frost registered being 70° as against 57° for the same month of 1888. The lowest readings occurred on the 4th, 23^d; 12th, 23^d; 22nd, 25^d; 28th, 25^d; 30th, 25^d. The lowest day temperature was 35° on the 12th, and the highest, 55° on the 17th.

On the rock garden the following species came into flower during the month, viz.: *Iris sophonensis*, *Schizostylis coccinea*, and *Helleborus purpurascens* var.

The total number of alpine and dwarf-growing herbaceous plants which have flowered during the past year in the rock-garden, amounts to 1484, being 58 less than during 1888. The number of species which came into flower each month was as follows: January, 20; February, 27; March, 60; April, 124; May, 380; June, 441; July, 258; August, 99; September, 38; October, 13; November, 8; December, 3; total, 1484. *Tussilago fragrans*, one of the forty plants whose dates of flowering are annually reported to the Society, came into flower on the 12th of the month.

"Report on the Temperature, Vegetation, &c., in the Botanic Garden, Glasgow, for December, 1889," by R. Bullen, Curator.

This has been a comparatively mild month, for although the thermometer has been at or below the freezing point on nineteen nights, the mean readings have been high for the month, varying from 32° to 22°, the latter being the lowest reading on the night of the 27th. Total readings, 61°. The day temperature was invariably high, so that, although light frosts were frequent, vegetation is in an advanced state. A plant of *Cydonia japonica* against a west wall has many fully developed leaves. Fruit of hardy trees and shrubs have rarely been so scarce as this year.

VEGETATION IN NATAL.

The illustration, fig. 17, from the Natal Botanic Garden, Durban, and which has been kindly sent us by Mr. Medley Wood, supplies food for reflection. Looked at from the mere point of view of æstheticism it is sufficiently striking, and may furnish hints as to grouping plants in winter gardens and similar large structures. It is interesting also in relation to the discussion going on in our columns at the present time. What would the rule-of-thumb gardener who had never seen one of these plants before in his life, one ignorant of *Aloes* and *Echeveria* plants, *Dracenas* and *Agaves*, knowing nothing of their nature, of their construction and powers of adaptation, or of the conditions under which they grow naturally, what would such a man do if suddenly called on to undertake their cultivation in this country? How could he find out for himself the treatment under which these plants would best adapt themselves to the means at his disposal?

On the other hand, supposing him to have a general knowledge of the conditions under which the plants grow in Natal, supposing him capable of appreciating the obvious relations between structure and function which these plants possess, would he not undertake the culture of these plants with a self-confidence which no mere empiricism could justify, and would he not arrive at a satisfactory result long before his purely empirical brother had finished his experiments, or his plants? The best gardener, as we have often insisted in these columns, especially when dealing with matters pertaining to vegetable physiology, is not he who slavishly and

often vainly attempts to copy Nature, but he who knows best how to make the plants under his charge grow under artificial conditions, and fulfil the purpose for which they are cultivated, an end often widely different from that which the plant in Nature strives to attain.

A GARDENERS' PROBLEM.

I BELIEVE Mr. Dyer's convictions in this matter are a good deal the result of experience at Kew, in the cultivation of what I may term good test plants, *i.e.*, plants which are found wild under exceptional conditions which cannot be even approximately imitated artificially, and for which other and suitable conditions must be found.

It will help us to understand the whole question better, I think, if the whole of the gardener's equipment for the management of all his plants is briefly stated. A complete garden contains a stove in which the maximum summer temperature is about 80°, and the minimum winter temperature 60°; an intermediate house, maximum temperature, 75°, minimum temperature, 55°; a greenhouse, maximum temperature, 65°, minimum temperature, 45°; and a few unheated frames. There are also rockery, beds, and walls out-of-doors. So far as temperature is concerned these are all that the most complete gardens contain: we have nothing more at Kew. Light can only partially be controlled; we can reduce it by shading, but we cannot intensify it. On the other hand, all plants grown under glass obtain less light than those out-of-doors. Moisture can be to some extent controlled, but it is impossible to keep a perfectly dry atmosphere in winter without introducing other conditions, almost, if not quite as harmful, as moisture. Soils are made up of loam, peat, leafmould, sand, manures, and sphagnum. All plants in cultivation in England must necessarily thrive in one or other or a mixture of these.

If the way to success in horticulture were only through a close imitation of Nature, then the number of plants capable of thriving under the artificial conditions provided in an English garden would be very limited. The fact is, horticulture so long as it was restricted to an attempt to reproduce natural conditions for cultivated plants, made a sorry mess of it. The history of *Orchid* culture in England is the best proof of this, and the same applies to all other departments of the garden. Horticulture is built up of traditions; it is, as Mr. Dyer said, an empirical art. The men who have made the art of gardening what it is now, were gardeners, not botanists, nor men learned in theologies, but practical men, who by dint of long practice and observation among garden plants, hit upon the best methods for their cultivation. If one is uncertain as to the best treatment for a plant, he does not apply to a botanist for help, but to some one who is known as a successful cultivator. Even the cabbage is found wild only by the seaside; *Armeria maritima* is likewise a seaside plant. *Mertensia maritima* grew splendidly in an ordinary border at Kew until a weak dose of salt was supplied, which killed it.

I know Lindley's *Theory of Horticulture* better, perhaps, than any other work on gardening, and I quite agree with Mr. Burbidge when he calls it "the book in which the very first principles of gardening are enshrined." Lindley's book is a sweeping together of all the traditions of good horticulture by one who in his long connection with the Royal Horticultural Society, of which he was Secretary, and also as founder and for many years Editor of the *Gardeners' Chronicle*, acquired a vast amount of information on cultivated plants. Anyone who reads the book can easily see where the gardener speaks, and where the botanist. This book is of the greatest value as containing explanations of what the gardener accomplishes, an exposition of the art as it was, certainly not any attempt to say what it should be; it is in fact the work of a gardener.

There are many men who combine botanical knowledge with horticultural skill, but I do not know that one of these can be called a better cultivator

than many who know nothing or very little of botany. One need not mention names, but it would be easy to single out a dozen of the very best cultivators in all departments of horticulture, who know little if anything of physiology or geographical botany. A knowledge of the principles of botany would be useful to a gardener, just as all knowledge is useful, but I doubt if gardening as an art would be a gainer. I know something of the two classes of gardeners, viz, those with a training more or less botanical—such as for instance the continental gardeners, trained in schools of gardening, and those whose training has been in good gardens and limited to cultivation, and I know that as a rule the latter is a much better gardener than the former. It will be understood that I am dealing only with the essentials to good gardening, and not with the gardener as an educated man. Botanists ignorant of the principles of horticulture, are often a positive hindrance to the gardener. There appears to be a tendency to call everything botany that is not merely routine gardening—I call that nonsense. Knight was a gardener, as also were Herber, Miller, the McNabs, and Dr. Moore, in all their work among living plants; whilst among living men, who does not recognise in Professor Foster, Sir William Bowman, Dean Hole, Canon Ellacombe, Mr Elwes, and Mr. Dyer, the gardener, setting about the work of cultivation just as empirically as the man who first planted *Saxifraga umbrosa* in a London back-yard.

I wonder if Mr. Heale, who is so successful with the new plants introduced by Messrs. Veitch, bothers much about geographical botany?—or Mr. Bull's new plants man, or Mr. Lows, Mr. Williams, or, indeed, anyone who has to treat a new and untried introduction? At Kew we receive dozens of new plants every year, but beyond the information that the seeds or plants are from China, or Java, or India, or the West Indies, or Brazil, we know nothing. Indeed, if one goes to the Herbarium, and looks up all the information to be obtained from specimen-sheets or books, it is rarely of any practical value. There are certain fundamental facts which we must know, such as whether a plant is aquatic or terrestrial, or epiphytal, although even this last has proved of little moment. Does anyone pretend to say that a flower-pot half filled with crocks and then filled up with peat is anything like an imitation of the naked bough or trunk of a tree, such as most epiphytal Orchids are found growing upon? Almost all Bromeliads are epiphytes, but we grow them in a strong soil such as suits *Dracaenas*. Anyone who cares to, may trace the gradual development of the present principles of Orchid culture from all kinds of experiments and blunders.

Mr. Elwes thinks the opinion of gardeners who have travelled will differ from that of gardeners who have not; I do not think it will. If a gardener has been properly grounded in the principles [practice?] of English horticulture, they will stick to him. Amongst Orchid cultivators I may name Mr. Shuttleworth, Mr. Horsman, Mr. G. T. White, who have seen Orchids in a wild state, but who nevertheless cultivate them here in the usual way. A botanist who has travelled and returns full of Nature's gardening, will probably do a frightful amount of mischief in his attempts to imitate Nature before he comes to know that "Nature and cultivation deal with problems which have scarcely anything in common."

It is significant that even in the tropics where orchid cultivation is attempted, English peat and sphagnum are imported for the purpose. Mr. Pantling, of Darjeeling, now on a visit to Kew, informs us that *Vanda cœrulea* cannot be cultivated as well in India as it is grown in England. We are more successful at Kew in the cultivation of *Dendrobium* McCarthie than Dr. Trimen is in Ceylon, the home of this grand species. The treatment of this plant leads me to the question of rest, discussed by Mr. Dyer. The Brainea mentioned by him is only one out of hundreds of cases in which the treatment of Ferns with regard to rest is just the opposite of what Nature affords. Mr. Morris is astonished to find so

many West Indian filmy Ferns growing under cool treatment at Kew.

The following are examples of plants recently introduced to Kew, and grown and flowered here under conditions very different from the natural:—

Narras (*Acanthosicyos horridus*). In vol. i. of the *Journal of the Horticultural Society*, p. 201, will be found an account of this plant by Dr. Lindley. It is a native of Walvisch Bay, and grows in hot, dry sand. Seeds of it were procured and sown at Chiswick, and the treatment was as near that of Nature as could be devised. Several sowings were made, but all the plants died when a few days old. Dr. Lindley wrote, "There now remains no problem in horticulture more difficult to solve than the way of preparing skilfully our artificial climates for the inhabitants of that heated atmosphere, intense light, heavy dews, and barren soil of South Africa, where the nails of the hand curl back and split in the season of dryness." Let me commend this extract to those who say a knowledge of natural conditions is indispensable. By the side of it I will place for comparison the details of Kew treatment for the *Narras*: house running north, south; temperature, summer 75° maximum, winter, 55° minimum. *Narras* sown in a bed of sandy loam, which is moist all the year round. The plant is now five years old, and in perfect health. I believe myself that age only is necessary to its flowering.

Welwitschia mirabilis. Plants of this at Kew are now nine years old. They were obtained from seeds sown in a hot, moist house, and afterwards removed to where the *Narras* now stands. This plant grows only in the sandy deserts of Damaraland, where the conditions are similar to those of the *Narras*. Mr. Monteiro had lived amongst the *Welwitschia*, and knew well its natural conditions. He took seeds of it to Portugal, and tried to grow them there, but his seedlings died soon after germination.

Mucuna acrobolobis is a Chinese climbing legume, with immense clusters of cream-coloured flowers, 17 inches long by 10 inches through. Mr. Westland, of Hong Kong, who found this plant and sent it to Kew, remarked that "it would make a grand creeper for the Kew Palm-house." We planted it there and it died, killed, evidently by heat. A second plant was then tried in the temperate house, where it is now over 20 feet high, and in perfect health.

Cumonia notata is a magnificent legume from West Tropical Africa, which has not yet flowered in Europe. At the request of Sir Joseph Hooker, I looked up all the information available at the Herbarium, with a view to imitating the natural conditions of this plant. Possibly failure resulted from my stupid attempt to reproduce natural conditions, at any rate, the plant languished and died. Then I tried rich garden-treatment for a stove climber, with the happy result that we have now a grand plant of much promise.

Begonia socotrana was introduced from Socotra to Kew by Dr. B. Balfour in 1880. The few scraps of bud-like tubers were planted at once in good *Begonia* soil, and eventually the plants flowered. They had been all the time in a moist stove. I confess that I did not then know, nor do I now, the natural conditions under which this plant grew; but when Dr. Balfour saw the Kew plants, he was astonished at the conditions under which we had produced plants larger and finer than any he had seen wild.

Lupinus Salvini proves to be a good greenhouse plant, but it came as a wail to Kew from Zaanzibar, and we grow it in a dry stove. A comparison between the figure in the *Bot. Mag.* and a plant grown in the greenhouse will show that we were wrong.

Venthorrea quadrangulata had often been sent from Swan River Territory to Kew, and killed by treatment which was an imitation of the hot arid sandy conditions of that region. In 1884, plants were again received; these may now be seen luxuriating in the winter garden under precisely similar treatment to that of *Sikkim Rhododendrons*.

Ranunculus Lyalli, *Streptocarpus Dunii*, *Rosa berberifolia*, *Aristolochia Goldiana*, *Anemone*

Fannini, *Gerbera Jamesoni*.—These are plants whose treatment at Kew has been successful, though quite different from that afforded them in a wild state. One might almost challenge any of the sticklers for Nature as a guide to show a single case of an exotic plant in cultivation receiving treatment identical with the natural.

If I might be allowed to venture an opinion on a subject not exactly in my line, I should say that the great lesson taught by the horticulture of to-day is this: Plants in a state of Nature appear to be restricted to certain areas prescribed by certain conditions, the variety of such conditions being almost as endless as the variety of plant life. At first sight it might be thought that the conditions peculiar to each plant were essential to its well-being, but horticulture has proved that almost all plants may be accommodated in a garden in a comparatively small island under conditions which can only be varied materially in regard to temperature. Even in temperature it has been proved that Nature is extravagant. We grow better *Ericas* in England than Nature does in Africa, in spite of her temperature of 90° or more in the shade, her burning sands, and her clear atmosphere. *W. Watson, Kew.*

MARKETS.

COVENT GARDEN, January 23

Business very dull, and prices of imported goods much lower. Grapes realising better value. *James Wither, Wholesale Apple Market.*

FRUIT.—AVERAGE WHOLESALE PRICES.

FRUITERS.—Market quiet, but no alteration in prices since last report.

SEEDS.

LONDON: Jan. 22.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, write that there is now greater disposition shown to purchase farm seeds. The chief inquiry has lately run upon fine home-grown red Cloverseed, of which the supply is short. American and Continental samples continue exceedingly cheap. Alsike and white now exhibit a substantial advance from the lowest points. Rye-grasses are cheaper than ever before known. For winter Tares there is an improved trade. Good black Rapeseed is wanted. Canary and Hempseed offer at tempting rates. For blue Peas and Haricot Beans values are steady.

FRUITS AND VEGETABLES.

STRAFORD: Jan. 22.—The supply has been good during the past week, and a fair trade was done at the following prices:—Cabbages, 1s. to 2s. 6d. per tally; Savoys, 2s. to 3s. do.; Cauliflowers, 3s. to 7s. do.; Turnips, 2s. to 3s. per ton; Carrots (household), 20s. to 40s. do.; (cattle feeding), 20s. to 24s. do.; Parsnips, 40s. to 50s. do.; mangolds, 14s. to 18s. do.; Swedes, 15s. to 18s. do.; Onions, English, 18s. to 20s. do.; Dutch, 6s. 6d. to 7s. 6d. per bag; Apples, English, 2s. to 6s. per bushel; Water-cress, 6d. per dozen; Brussels Sprouts, 1s. 6d. to 2s. 3d. per flat; do., 1s. to 1s. 6d. per half sieve; Celery, 7s. to 8s. per dozen rolls; Spanish Onions, 6s. to 7s. 6d. per cwt.

SPITALFIELDS: Jan. 22.—Good supplies of all kinds, but a heavy demand. Potato trade exceedingly quiet. Prices were as follows:—English Apples, 1s. to 8s. per bushel; Nova Scotian do., 14s. to 21s. per barrel; Bordeaux do., 7s. to 2s. 6d. per case; foreign Tomatos, 2s. per box; forced Rhubarb, 1s. 6d. to 2s. per dozen bundles; Seakale, 10d. to 1s. 6d. per punnet; Curly Kale, 5d. to 1s. 3d. per bushel; Cabbages, 1s. 3d. to 3s. per tally; Savoys, 2s. to 4s. do.; Cauliflowers (Cornish), 4s. to 4s. 6d. do.; Guernsey do., 3d. to 1s. per dozen; Guernsey Radishes, 6d. to 1s. per dozen bunches; Turnip-tops, 1s. 6d. to 2s. 6d. per sack; Brussels Sprouts, 1s. to 1s. 6d. per half sieve; Turnips, 1s. 3d. to 2s. 6d. per dozen bunches; Carrots, 1s. 6d. to 2s. 6d. do.; Parsley, 1s. 6d. to 2s. 4s.; Horsa-radish, 1s. to 1s. 6d. per bundle; Celery, 4s. to 10s. per dozen bundles; Parsnips, 8d. per score; Beet-roots, 3d. to 6d. per dozen; English Onions, 6s. 6d. to 8s. 6d. per cwt.; Spanish do., 6s. 6d. to 7s. 6d. per case; Dutch do., 5s. to 6s. per bag of 110 lbs.; Leeks, 1s. to 1s. 6d. per dozen; Mustard and Cress, 1s. to 2s. per dozen baskets; Endive, 1s. to 1s. 6d. per dozen; Carrots, 20s. to 28s. per ton.

POTATOS.

BOROUGH AND SPITALFIELDS: Jan. 21.—Supplies continue large and trade very dull. Best qualities steady; other sorts irregular. Regents, 45s. to 85s.; Hebrons, 40s. to 100s.; Magnum Bonums, 40s. to 100s.; Imperators, 45s. to 70s. per ton.

STRAFORD: Jan. 22.—Quotations:—Scotch Regents, 30s. to 70s.; do., Magnums, 35s. to 80s.; light English do., 50s. to 65s.; dark, do., 45s. to 50s. per ton.

SPITALFIELDS: Jan. 22.—Quotations: Hebrons, 40s. to 100s.; Regents, 45s. to 80s.; Imperators, 45s. to 70s.; Magnums, 45s. to 70s.; Ruby Rose, 40s. to 60s. per ton.

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending January 18, is furnished from the Meteorological Office:—

"The weather has continued in a very unsettled condition generally. In Ireland and the greater part of Scotland a good deal of rain has fallen, but in most of the English districts the rainfall has been slight and some fine, bright days have been experienced. Towards the end of the week thunder and lightning occurred at many of our more western and northern stations.

"The temperature has again been much above the mean, the excess having ranged from 4° in Ireland, N.W., and 5° in the Channel Islands, to 6° or 7° in most other districts, and to 8° in Scotland, E., and the Midland Counties. The highest of the maxima which were registered on somewhat irregular date ranged from 52° in Scotland, W., to 57° in England, N.W., and Ireland, S., and to 59° in Ire-

land, N. The lowest of the minima were generally recorded either on the 14th or 15th, and varied from 30° in England, E. and Scotland, W., to between 31° and 33° degrees in most other districts, and to 36° in the Channel Islands.

"The rainfall has exceeded the mean in Ireland, and the north and east of Scotland, and has equalled it in England, S.W., but in all other districts a deficit is shown.

"Bright sunshine has been more prevalent generally than for some time past. The percentage of the possible amount of duration ranged from 3 to 18 in Scotland, from 21 to 25 in Ireland, and from 18 to 31 over England.

[By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the direction, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.				RAINFALL.	BRIGHT SUN.
	Always (+) or below (-) the Mean for the week ending January 18, 1890.	Accumulated.	Day-deg.	Day-deg.		
1	6	27	10	14	58	3
2	8	31	11	11	67	6
3	7	29	8	13	42	2
4	7	30	11	14	41	3
5	8	37	9	17	41	2
6	7	32	3	42	19	3
7	7	29	3	40	69	3
8	7	34	3	44	51	1
9	6	30	0	42	2	0
10	4	36	8	41	47	5
11	6	30	1	48	82	2
12	5	49	0	53	15	3

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts:—1, Scotland, N.; 2, Scotland, E.; 3, England, S.E.; 4, England, E.; 5, Midland Counties, England, S.

Principal Grazing Areas, Districts:—7, Scotland, W.; 8, England, S.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

LAW NOTES.

THE PROSECUTION OF A SALESMAN.

FREDERICK WISE, late of the Flower Market, Covent Garden, was again charged at Bow Street before Sir James Ingham on Thursday last, with having obtained goods by means of false pretences from various people. Further evidence was gone into with regard to the two cases already mentioned (p. 89), after which evidence was taken with reference to goods obtained under similar circumstances from Mr. Simmons, of Sandbeck Park, Rotherham. The case was ultimately again adjourned next Tuesday.

NOTICES TO CORRESPONDENTS.

Books: J. B. Hood's *Warming and Ventilating of Buildings* is published by Messrs. Simpkin Marshall & Co., London. We do not know the price.

CYPRIPEDIUM LEUCANUM: R. T. Both specimens are referable to this hybrid variety. Scarcely two individual plants are quite alike.

DISTANCE APART FOR GROS COLMAR VINES.—For such a vigorous vine the greater distance you name would be preferable. Crowding vines does not result in heavy crops.

FRENCH ASTERS: *Aster chinensis*. Apply to M. Tréhaut, Versailles.

"LONDON PURPLE": R. This is stated to be the arsenical residue left in the manufacture of magenta dyes. Paris green is an aceto-arsenite of copper. Both are dangerous poisons, and their use should be attended with the utmost care.

MUSCAT OF ALEXANDRIA VINES IN BLOSSOM: H. B. P. The temperature in which the best "set" may be obtained is one of about 65° as the maximum, and 62° as the minimum at night, and during the day 70° to 75°, the higher temperature on sunny days with air.

NAMES OF FRUIT: J. C. Apples: 1, Winter Peach; 2, Hambleton Deux-ans. Pear not recognised.—J. M. Pear very much bruised—probably Chaumontelle.

NAMES OF PLANTS: Guernsey. *Parietaria officinalis*, said to contain nitre.—H. J. R. *Gomesia crispata* and *G. planifolia* belong to *Vanda*, and are not found in gardens. *Humboldtia*, a synonym of *Platrobathia* The *Bulbophyllum* named is not found in gardens. *Bifenaria inodora*, B. tenuiflora, order *Vanda*, are not worth growing.—E. A. M. 1. *Azropyrum cristatum*; 2, *Danthonia curvifolia*; 3, *Danthonia trichotoma*; 4, *Bigelovia gracilens*. The other plant you mention is, no doubt, *Panax longissimum*.—F. S. *Cyperus Meyrianus*.—R. B. E. *Antholyza oethiopica* var. *licolor*, Gayard.—A. P. *Itevia longifolia*.—F. S. M. *Lycaste costata*, not uncommon.

NARCISSUS BEETES: D. They are affected with a common pest, the grub of a two-winged fly, called *Merodon narcissi*. Destroy the affected

FIG. 10.—MERO-DON NARCISSI—THE NARCISSUS BEETLE.

bulbs. We do not know how else to cope with the enemy.

OFFICERS OF ROYAL PARKS IN AND ABOUT LONDON: The names of these officials are to be found in *Whiteaker's Almanack*, but not in the horticultural directories.

SUPERPHOSPHATE OF LIME, CARBONATE OF POTASH, &c.: J. T. These manures, and the others named in your note, may be bought of any dealer in artificial manures. The prices vary somewhat, and may be ascertained from the dealers.

TO TURN A STANDARD ROSE INTO A CLIMBING ONE: H. E. Select a few of the strongest shoots of a rampant-growing variety, cut away the remainder, and train them to the fence or trellis after cutting off their tips. Keep all weak shoots that may spring from the old wood at the base cut away. The leading shoots will then make good progress, and in future years they may be shortened back somewhat, and allowed to develop to the desired extent.

* * * G. should send his name and address.

The maximum of utility and the minimum of cost. Constructed of strong Iron uprights and galvanised Barbed Steel Wires.

Price, 10s. 6d. each.

THE TESTIMONIALS.

The Gardens, The Whittier, Kingston, Feb. 9, 1888.

Dear Sirs,—The 100 Barbed Wire Tree Protectors you sent to Mr. Green's order I have now fixed to the trees, and I feel bound to say that I never saw anything in the shape of a tree-protector equal to them. I think I shall be able to add further testimony after the cattle are turned out in the spring.

Yours faithfully, J. WAINMAN.

The Gardens, The Whittier, Kingston, Sept. 26, 1888.

Gentlemen,—The 100 Porcupine Tree Guards you supplied to Mr. Green's order have proved a great success. In fact, they are the best I ever saw. These guards will well

protect the trees, therefore cattle cannot, and will not, attempt to reach the branches. I would strongly recommend anyone who contemplates planting trees, and who wishes to know what is the best guard to use, to give priority to "C" a trial. Yours faithfully, J. WAINMAN.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentlemen waited on in any part of the country. Plans and Estimates free on application.

MESSENGER & COMPANY, LOUGHBOROUGH.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charges.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is to be commended as a specially good medium. Cheap Rates.

GARDENING APPOINTMENTS.

MR. F. C. KING, for over five years Foreman to Mr. W. COLLETT, Sudbourn Hall Gardens, Suffolk, has obtained the appointment advertised in these columns recently with Messrs. PEARCE BROTHERS, of Sydney, New South Wales. There were more than one hundred applicants.

MR. JOHN PINDER BOWER has been engaged as Gardener to J. D. BLAND, Esq., Kippax Park Castleford, Yorkshire.

MR. J. LEMSTER, late Foreman at Hillborough Castle Gardens, has been engaged as Head Gardener to Lord FARNHAM, Farnham House, co. Cavan, Ireland.

WANTED, for a Dutch Horticultural Firm, an AGENT for the whole of Great Britain, with domicile, if possible, in London, to Sell Ferns, Shrubs, Plants, &c. Some optional references required.—E, at Shelly & Co. 5, Leadenhall Street, E.C.

WANTED—ADVERTISER desires to meet with an intelligent and well-informed Gentleman of about twenty-five years of age, of industrious, energetic, and persevering habits, experienced in Nursery Management (especially Outdoor), to assist him in the Development of a Nursery Business in the South, doing a local as well as a wide-spread trade. In the event of his meeting with a suitable person, an arrangement with a view to partnership might be entertained, but in no case would high wages be given at starting. First-class references required.—Apply, by letter, with full particulars, to E. H. B. Box, Smith's Advertising Agency, 142, Fleet Street, London, E.C.

WANTED, AT ONCE, a thoroughly practical and experienced WORKING MANAGER, for an important branch Florist Business in S.W. district. Must be a first-class hand at high-class Cut Flower Arrangements, Dinner Tables, &c., and General Finishing, Decorating, and Window Dressing, used to the London Trade. Also a young LADY for the same business, who has been accustomed to Serve, and who is also a high-class Florist. Full set particulars of ability, &c., by letter, to J. W. SILVER, Streatham and Salford Nurseries, London, S.W.

To Park Keepers and Gardeners. **WANTED**, a PARK KEEPER for the Victoria Park, Wandsworth, who thoroughly understands Gardening, Tree Culture, and Propagating. Wages 30s. per week with house and fire, &c.—Application stating age, experience, &c., with three recent testimonials, to be sent before Wednesday, January 23, to MR. HENRY WARR, Clerk to the Local Board, Church Street, West Bromwich.

WANTED, a HEAD WORKING GAI-DENER, where another is kept. Married, not over 40. Must understand Growing of Ornaments and Greenhouse Plants, Chrysanthemums, Tomatoes, Flower and Kitchen Garden, &c.—Apply by letter, giving full particulars of experience, references, &c., to H. HOWARTH, Coleman, Horwich, Lancashire.

WANTED, a GARDENER, thoroughly experienced, to take entire Management of 5 Houses for Tomatoes, Cucumbers, and Cut Flowers, and about 1½ acre of Garden. No reply unless being engaged in Market Work.—E. R. Gardeners' Chronic Office, 41, Wellington Street, Strand, W.C., stating age, wages required, last two employments, and how long engaged.

WANTED AT ONCE, a GARDENER, for Small Suburban Garden, and to assist in House Work. Thoroughly experienced in and Out. Permanent job for a really good, steady, reliable man. Must have first-rate character. State if married, age, and full particulars, and be well-referenced. Advertisements in *Gardeners' Chronicle* (Three, 4, Wellington Street, Strand, W.C.

Decorator.

WANTED, for a Large Private Establishment, a young GARDENER, with good taste for Table and House Decoration. One who has gained some experience in France preferred. Situation permanent. Good wages given.—Experience, and all particulars, to K. F. B., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

Gardener.

WANTED, a Man and his Wife, as GARDENER and LAUNDRESS, without family, both thoroughly good; he must understand the cultivation of Grapes and general Hot-house work; a second man kept. A comfortable dwelling with good wages.—Apply by letter to M. L., 114, Norwood Road, West Norwood.

WANTED, a good Man as MARKET GARDEN FOREMAN (one who has filled the same position before). He must thoroughly understand his work, and able to give satisfactory references.—J. SMITH, Grove Park Farm, Chiswick, W.

WANTED, a SECOND GARDENER, with experience, in and out.—Apply by letter.—Apply, with particulars of age, wages, experience, &c., to G. HILLMAN, Woolton House, Woolthay, St. Albans, Hants.

WANTED, a good UNDER GARDENER, a strong active young man. Must be experienced under Glass, a good Chrysanthemum Grower, and be well recommended for the Midlands.—B. W., *Gardeners' Chronicle* Office, 41, Wellington Street, W.C.

WANTED, an active industrious young Man as FOREMAN in the Houses.—Apply with copies of testimonials, to GARDENER, Lockington Hill, Derby.

WANTED, a FOREMAN for the Florists' Flower Department, where Carnations, Chrysanthemums, Pyrethrums, Phloxes, Pansies, &c., are grown in very large quantities; must be a man who has had considerable experience in the propagation and growth of the above. None need apply who have not had his experience, and whose character will not bear the strictest investigation. This is an exceptional opening for a really good man, the appointment will be permanent, and commencing at a liberal salary.—Apply, giving particulars of engagements, experience, and age, also stating whether married or single, to THOMAS S. WADE, Hale Farm Nurseries, Tottenham, London.

WANTED, a strong, active, married MAN, as Second, for the Houses. Must be a good Plant Grower and House-Decorator, and have undeniable character. Familiar with roots, and good wages given, to a reliable man. Wife to attend Gade.—Address, with references from last employer, A. WILKINSON, Cammarg, Wundulston.

WANTED, a young MAN, as Second, where four are kept. Must understand Inside and Out Work. Both and vegetables—State age and wages to C. BARNETT, Hilton Park Gardens, Wolverhampton.

WANTED, young MAN, Good Knife-man: used to General Nursery Work, as well as to arranging Wreaths, Bouquets, &c.—HAINSWORTH AND CO., Hiley.

WANTED AT ONCE, ONE or TWO young MEN, as Improvers. Must understand Potting, Tying, and have a knowledge of Propagating, under the Foreman.—Apply, stating age and particulars, to FREDERICK A. WHITE, for Escotors, Royal Nurseries, Hornchurch.

APPRENTICES.—We have now VACANCIES, and can take THREE or FOUR young MEN who are desirous of acquiring knowledge of Horticulture.—H. CASSELL AND SONS, Swanley, Kent.

OLD ESTABLISHED HOUSE WISHES TO MEET with COMMERCIAL TRAVELLER engaged in northern counties, in Seed or Plant Business, who will combine therewith the introduction of a Specialty for use in the Trade. First-class references given and required.—C. W., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED IMMEDIATELY as SHOPMAN and SALESMAN, active and of good address, thoroughly acquainted with the Retail Counters Trade. Seeds and Bulbs, also with a thorough knowledge of Accounts, the Nursery and Plant Department, and competent with the Making-up of Wreaths, Crosses, Bouquets, and the general Furnishing Department.—Apply, stating full particulars as to experience, and all particulars, and be well-referenced, to FREDERICK A. WHITE, for the Escotors, Royal Nurseries, Hornchurch.

SHOPHAND WRITER WANTED, good. Who has been trained to Gardening, Speed 120 words per minute. State experience, age, and salary expected to J. B. R., Street & Co., 29, Cornhill, E.C.

WANTED, an experienced SHOPMAN, of good address. Must be well acquainted with the Garden Seed Trade and Books, a good Cut Flower Trade in and out.—State age, salary expected, with references to HORTON, Messrs. Cooper, Tabor, & Co., 30, Southwark Street, London, S.E.

WANTED, an ASSISTANT SHOPMAN. A young, steady, active, and quick at Counter Work—Seed and Floral Trade principally. Highest references required.—Apply, stating age, wages required, &c., to EDWIN HILLIER, The Nurseries, Winchester.

Shopman, Assistant Improver.
WANTED, a young MAN, as above, in Shop, where a Retail Seed, Plant, Wreath, and Cut Flower Trade is done.—Age, experience, and wages required, to BARRACKS, Finkle Street, Kenal.

WANTED, an experienced young LADY, accustomed to West End Trade preferred. ABO-ONE or TWO YOUNG MEN, well up in London Furnishing Trade.—Apply letter only, stating age, salary expected, and experience, to JAMES BROWTH, 25 and 29, Buckingham Palace Road, S.W.

WANTED, a young LADY FLORIST. Must be good experienced hand.—Apply by letter to PONSFORD AND SON, Loughborough Park, Boxton, S.W.

WANT PLACES.

Letters addressed "Pete Hestants" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 12, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable to a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from withdrawing it.

The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.
NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark, an envelope by which to identify the sender, or the name of the office, or a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.
JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Emittances should be made to 237 and 239, High Holborn, W.C.

SCOTCH GARDENERS.—I have at present several very superior MEN on my Register, whose character and ability is their chief recommendation.—JOHN D. WATSON, 20, Royal Nurseries, Edinburgh.

Gardeners, Farm-Bailiffs, Foresters, &c.
DICKSON & CO., Royal Nurseries, Chester. (Lancashire), are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All parties are on application to Telegraphic and Postal Address:—"MR. KISSON, CHESTER."

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will do all in their power to supply any gentleman with particulars. See, St. John's Nurseries, Worcester.

Gardeners, Foresters, Land Stewards.
R. B. LAIRD AND SONS can recommend with every confidence Scotchmen thoroughly qualified as GARDENERS, FORESTERS, or LAND STEWARDS, either for large or small establishments, and will be pleased to furnish full particulars on application.—17, Fifebrink Street, Edinburgh.

B. S. WILLIAMS AND SON beg to intimate that they have at present in their Nursery and upon their Register some excellent Men, competent either to all the situations of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Victoria and Paradise Nurseries, Upper Holloway, N.

Gardeners, Foresters, and Farm Bailiffs.
LITTLE AND BALLANTYNE, The Queen's Nurseryman and Seedsmen, Carlisle, invite correspondence with Land Proprietors, Agents, and others requiring the services of GARDENERS, FORESTERS, or FARM BAILIFFS. Their extensive business relations throughout the Kingdom enable them to distinguish men of good character and ability, such as they would be glad to recommend.

GARDENER (HEAD).—Age 55; thoroughly efficient man in all branches. Over eight years in present situation.—W. GILL, Worsley, near Brookhouse, Herts.

GARDENER (HEAD).—Age 40; highly recommended, thoroughly efficient in his duties.—J. H., Albany Road, Hesham, Wotton-on-Thames, Surrey.

GARDENER (HEAD).—Age 31; sixteen years' experience in St. George Greenhouse, Peaches, Vines, &c., Flower and Kitchen Gardening; thoroughly good character.—T. B. Mr. Had-on, Farnfield Terrace, Wakefield.

GARDENER (HEAD).—Thoroughly experienced in all branches of the profession. Life experience; unexceptional character.—B. GILBERT, 121, D-mark Road, Camberwell, S.E.

GARDENER (HEAD).—Age 48, married; eleven years in present situation. Highly recommended. Thoroughly experienced in all branches.—HEAD GARDENER, Kirk Ella House, near Hull.

GARDENER (HEAD).—Age 32, married; eighteen years' experience in good places. Thoroughly competent in all branches. Good character. Abstainer.—F. C., Tongham, near Farnham, Surrey.

GARDENER (HEAD), where two or three are kept.—Age 31, married, one child (age 9).—Well up in all branches. Had Charge of present Gardens eleven years. Late Foreman at Woolley Park.—T. W., The Gardens, Witley, Buntingford, Huddersfield.

GARDENER (HEAD), where two are kept, or good SINGLE HANDED.—Age 29, married, one child. Mr. MAYSON, Gardener, Busby Down, Tooting, will be pleased to recommend me as above.—ROFFEY, 25, Thrift Road, Streatham, S.W.

GARDENER (HEAD).—Middle-aged, married, no family. Experienced in Early and Late Forcing of Fruits, Flowers, and Vegetables, Pleasure and Kitchen Garden. Three years' good character; fourteen previous.—W. KING, 7, Tylney Road, Forest Gate, Essex.

GARDENER (HEAD); age 29.—J. TRIGGER, The Gardens, Milton Park, Peterborough, can very highly recommend James Tixey, who has been with him seven years as General Foreman, to any Noblemen or Gentlemen requiring the services of a good and reliable man.

GARDENER (HEAD); age 30, Scotchman.—A. McLEOD, Gardener to the Marchioness of Headfort, Headfort Gardens, Kells, Co. Meath, Ireland, can with confidence recommend his Foreman (Mr. McKellar) to any Lady or Gentleman requiring a thorough practical, good all-round Gardener. Fourteen years' practical experience.

GARDENER (HEAD); married.—W. KEMP, eight years Head Gardener to Lord Lindlip, Doseberg Hall, is now open to treat with any Noblemen or Gentlemen requiring a practical, energetic man. Highest testimonials from late employer, who will be pleased to recommend the above.—Barnet, Derby.

GARDENER (HEAD), where two are kept; Age 30; married, one child.—JOHN MASSON, The Gardens, Bushey Down, Tooting, will be pleased to recommend me to any Lady or Gentleman requiring a competent man as above. Two years in present place; four and a half years previous.—C. ROFFEY, 25, Thrift Road, Streatham, S.W.

GARDENER (HEAD).—Age 36, married, no family. Scotch, nineteen years' experience in Early Forcing of Fruit, Flowers, and Vegetables, Pleasure and Kitchen Garden. Five and a half years' excellent character as above.—W. B., 49, Addison Road North, Notting Hill, W.

GARDENER (HEAD).—Age 40; offers his services to any Noblemen, Lady or Gentleman. Thoroughly competent in Orchids, Vines, Ferns, Stone Plants of all kinds, Early and Late Forcing. Good Kitchen Gardener. Will be pleased to take Dairy and Poultry. Good reference.—ABSTAINER.—E. D., 17, Leche Road, Pashalme Lane, Dorking, Surrey.

GARDENER (HEAD), married, without family.—R. H. SMITH, Head Gardener eleven and a half years to Sir Thomas Mosley, Bart., Rolleston Hall, is now open to treat with any Noblemen or Gentleman requiring a thorough practical, energetic man. Highest testimonials from late and previous employers.—175, Horningwood Road, Burton-on-Trent.

GARDENER (HEAD WORKING).—Age 32, single; twenty-one months' character, twelve years' previous.—Experience, and all particulars, to GARDEN FOREMAN, Sir G. Meyrick, Bart., Llangefni, Wales.

GARDENER (HEAD WORKING).—Age 29, married, no family; experienced in Vines, Stone and Greenhouse Plants, Kitchen Garden, &c. Good recommendation.—F. HAYLER, Copthall, Busbuck, Surrey.

GARDENER (HEAD WORKING).—Age 31, married, two children; twenty-five years' experience in all branches. Excellent testimonials.—X., F. Street, Heathside Nurseries, Farnborough Station, Hants.

GARDENER (HEAD WORKING), where two or more are kept.—Age 32, married, three children; nearly five years in present situation.—RICHARDS, West Langton, Market Harborough.

GARDENER (HEAD WORKING), where two or three are kept.—Age 31, single; sixteen years' practical experience in all branches. Good references.—GARDENER, 7, Egerton Cottages, Walford, Berks.

GARDENER (HEAD WORKING), where two or three are kept.—Age 34, married, two in family (youngest age eight); understands Vines, Peaches, Melons, Cucumbers, Tomatoes, and the general routine of Greenhouse Plants, and well experienced in Kitchen Gardening. Five and a half years' good character; nine previous.—A. B., The Vineries, Framfield.

GARDENER (HEAD, or good SINGLE HANDED).—Well up in the Growing of Orchids, Flowers, Fruit, Vegetables, and Forcing. Five and a half years in last situation. Good character.—X. Y. Z., 82, Martin's Street, Walthamstow, Berks.

GARDENER (HEAD), where one or two are kept, or good SINGLE HANDED.—Married, no family, understands Vines, Peaches, Flower and Kitchen Gardening, &c. Good references; Abstainer.—B. BECK, Elham Hall Gardens, Brigg, Lincs.

GARDENER (HEAD, or good SINGLE HANDED); age 32, married, four children.—E. H. PEARCE, Esq., wishes to recommend his late Gardener to Lady or Gentleman requiring thoroughly practical man. Fifteen years' experience in all branches. Seven years' excellent character. Abstainer.—GARDENER, Highgrove, Minsterworth, Gloucester.

GARDENER, or GARDENER and BALIFE.—The LIVERPOOL HORTICULTURAL CO. (John Cowan), Limited, The Vineyard and Nurseries, Garston, near Liverpool, wish to recommend a first-class man in the above capacity. Unexceptional references. Full part colors on application to the Company.

GARDENER, in a Small Place, or under a Head Gardener.—Young, married; strictly steady. Excellent references.—GEO. VAUGHAN, Church Street, Bishop's Castle.

GARDENER.—Unmarried; Kitchen and Flower Garden, small Conservatory, and Forcing-house. Willing to make himself useful. Outdoors. Wages 21s. per week.—Apply, H. H. Western Hall, Carlisle.

GARDENER.—Age 31, married, no family; large experience in all branches. Five years in present situation.—W. W. Edward Sang & Sons, Nurserymen, Kirkcaldy.

GARDENER, where two or three are kept; age 28.—Mr. PARKER, Moreton Court Gardens, Hereford, would be pleased to recommend his Foreman, J. Harris, to any Lady or Gentleman requiring a practical man as above.

GARDENER.—A GENTLEMAN wishes to recommend his Gardener, who wants to leave him for a smaller place. Excellent character can be given. Thoroughly understands his duties.—K. K., care of Manwaring, Broadwater, Worthing.

GARDENER (GOOD SINGLE-HANDED), or where help is given.—Age 29, married when suited, twelve years' experience. Two years' good character from present employer.—J. LUFFE, Elmora, Clapstead, Surrey.

GARDENER (GOOD SINGLE-HANDED).—Age 37, no family; wide good Landress. Nearly four years in present situation, six in previous. Understands Early and Late Forcing, and Flower and Kitchen Garden.—GARDENER, 3, South View, Milton Road, Weston-Super-Mare, Somerset.

GARDENER (SINGLE-HANDED) or otherwise, good references; six years' last situation, three previous.—ANDREW, 65, Queen's Road, East Grinstead.

GARDENER (SINGLE-HANDED), or with help, for General Garden work. No family; good character. State wages.—GARDENER, Sherwood Lodge, Bonhill Hill, Upper Norwood, Surrey.

GARDENER (SINGLE-HANDED), or where help is given. Age 25; experienced both Inside and Out. Three years' good character and references. State wages.—W. H. CUMBER, Langton Road, Tonbridge Wells, Kent.

GARDENER (SECOND), or good THIRD, where four or five are kept. Excellent early and late forcing. Has had good experience. Character well found strict investigation.—JACKSON, Claydon Park, near Winton, Buck.

GARDENER (SECOND, or good THIRD); age 21.—A Gardener wishes to recommend a young man as above.—HARVEY, Oakfield, The Avenue, Gray's Hill, S. E.

GARDENER (SECOND or THIRD), where three or more are kept.—Young, strong and active; eighteen months' excellent character from present situation.—GEOFFREY POWELL TUCKER, Mynydderwen, Swansea Valley, South Wales.

GARDENER (SECOND, or UNDER), Age 23; nine years' experience Inside and Out. Good character.—J. LEONARD, The Gardens, Westworth Castle, Burnley.

GARDENER (UNDER).—Age 21; ten years' experience. Good references. G. JAMES, The Gardens, Rusham Park, Stoupe Aston, Oxon.

GARDENER (UNDER).—Age 23; willing to make himself useful. Five years' good character. W. TITCOMB, 15, Prince's Street, New Swindon.

GARDENER (UNDER). Age 19; five years' experience Inside and Out. Good character.—Mr. WATSON, The Gardens, Langford, Brixton Hill, S. W.

GARDENER (UNDER).—Age 21, single; good character. Strong and willing.—T. BRINKLOW, 43, Dorset Meads, Grosvenor Place, London, S. W.

GARDENER (UNDER).—Age 21, strong; seven years' good character. Inside and Out. Willing to be useful.—Apply, at long particulars, to DAVIES, Gardener, Salem House, Parkside, Lymington.

GENERAL FOREMAN, or MANAGER, in a Market Garden.—Thirty years' practical experience. Inside and Out. Good character.—E. H., 11, Wellington Street, Strand, W. C.

NURSERYMAN, Indoor and Out. Fifteen years' experience, with years in London, bought out Flowers and Plants on Covent Garden. Could manage Branch Establishment. A. B., 68, St. John's Road, Highgate, N. C.

TO FLORISTS in want of a Foreman under Glass, or in the Cut Flower Department. In consequence of discontinuing this branch of his business, Mr. VERTEGANS has Two or Three worthy Men he can with confidence recommend.—Clad Valley, Birmingham.

FOREMAN, Indoors, in a good establishment.—Well up in Orchids, Chrysanthemums, Early and Late Forcing, and Flower Department. Can have first-class recommendation.—T. BEESLEY, Haverley Park, Rowford, Essex.

FOREMAN, in a good establishment.—Age 27; over thirteen years' experience. Excellent testimonials from last and previous employer.—C. LINK, The Gardens, Evesingham Park, York.

FOREMAN, in good establishment.—Age 24; nine years' experience. Two years as above in present situation. Good testimonials.—GARDENER, Randall's Park, Leatherhead, Surrey.

FOREMAN, in the houses.—Mr. BLAND, Seaber House, Fortham, Soham, can with confidence recommend his late Foreman. Thoroughly experienced.—Please state particulars to above, or to F. H., Haulsworth, Sheffield.

FOREMAN, in Market Nursery.—Age 30, married. Fifteen years' experience, six as Foreman; Growing Grapes, Cucumbers, Tomatoes, Peaches, Fennel, and Cut Stuff.—BUTLER, St. George's Villa, Hanworth Road, Hanworth, Middlesex.

JOURNEYMAN (FIRST), in the Houses.—Age 24; seven years' experience, partly in the Midlands. Good recommendation from present situation.—H. SNELL, The Gardens, Teobosc, Tross.

JOURNEYMAN.—Age 22; good character, five years' experience, three and a half years' last situation. Abstainer.—G. CLARKE, OFFICE, 11, HITCHIN, Herts.

JOURNEYMAN in the Houses; age 21.—F. GIBSON can with confidence recommend H. BOWELL as above.—Cowley Park Gardens, Marlborough, Sussex.

JOURNEYMAN, Inside and Out. Age 19; both preferred. Five years' experience, good character. H. MORRIS, Waterhouse Gardens, Southampton Road, Salisbury.

JOURNEYMAN.—Mr. PHILLIPS, the Friars' Gardens, Newport, Mon., can strongly recommend a thoroughly industrious and respectable young man.

JOURNEYMAN, under Foreman.—Age 22; Abstainer. Three years' good character from last employer.—W. G., 15, Edward Street, Dunstable, Beds.

JOURNEYMAN, Inside.—Age 20; four years' experience. A strong, energetic young man, desires situation as above. Excellent character. Both preferred.—H. JACKSON, Middle Claydon, Woking, Bucks.

JOURNEYMAN, in the Houses; age 21.—W. H. MANNING can with every confidence recommend a quick, active, steady young man as above.—The Gardens, Garmos, Hereford.

JOURNEYMAN, in Private Establishment. Age 19. Where three or four are kept; both preferred. Four and a half years' good character.—N. D., Ashford, near Staines, Middlesex.

JOURNEYMAN, in the Houses.—Age 22; Both preferred. Four years' good character from last place; well recommended.—JOSEPH BACON, Tutbury, Burton-on-Trent.

JOURNEYMAN.—Age 21; willing, active, strong. Well recommended. Five years' last situation.—W. NEWHAM, South Lodge Gardens, Hosham, Sussex.

JOURNEYMAN, in the Houses.—Age 19; Both preferred. Three years' good character. Can be well recommended.—Mr. WARD, Gardens, Stoke Edith, Hereford.

JOURNEYMAN, in good Establishment.—Age 29; four and a half years in previous situation, and two years in present situation.—F. CUTLER, The Gardens, Olddon House, Lockington, near Almondbury, West-riding, Yorkshire.

JOURNEYMAN, in the Houses.—Has had good experience; can be highly recommended. Six years' and a half in present situation.—F. CUTLER, The Gardens, Olddon House, Lockington, near Almondbury, West-riding, Yorkshire.

JOURNEYMAN, in Houses.—Age 19; Both preferred. Three years' good character from present situation. Well recommended.—E. CHARLES, Chequer Hall, East Grinstead, Sussex.

JOURNEYMAN, in the Houses, under a Foreman; age 20.—F. KING would be pleased to recommend young man as above; seven years' good character. Both preferred.—F. KING, The Gardens, Oak Dove, Holm Wood, Surrey.

IMPROVER, under a good Gardener.—Age 17; Four years' good character.—H. COOKE, Aldergate Terrace, Stonehouse, Gloucestershire.

IMPROVER, under a good Gardener, in both.—Age 19, two years' character.—F. S. E. Bamford Cottage, Harrow Weald near St. Albans, Middlesex.

IMPROVER in Nursery or Gentleman's Garden. Age 20. Good Premium given; highest references.—ALFRED HORSBY, 99, Gwydar Street, Cambridge.

IMPROVER, for Private Gardens.—Age 19; three years' experience, and three years' good character. A premium given. W. M. SMYTHE, The Gardens, Basing Park, Alton, Hants.

IMPROVER, in the Houses.—Age 19; both preferred. Three and a half years' good character. Two years in the Houses.—A. COLLINGS, Holbrook, near Ipswich, Suffolk.

APPRENTICE. A Gardener wishes to apprentice his Son to a good all round Gardener. Has had some experience. Later J. FREEMAN.—E. SHELLTON, Wainsome Hill, Weston-super-Mare.

TO NOBLEMEN and GENTLEMEN.—A situation in Private Establishment, round Manchester or Liverpool preferred. Four years' experience.—R. L., *Gardener's Chronicle* Office, 11, Wellington Street, Strand, W. C.

TO ROSE GROWERS.—Young Man (age 21) requires a situation among Roses. Four years in one of the leading firms. Good character.—Apply, stating wages, to F. BATEMAN, Longlands Nursery, Sale, Kent.

TO GARDENERS. Wanted, a situation for a strong, active Lad, age 16, under a good Gardener. Has had experience in Glass Work, and wishes to improve himself. Gentleman's place preferred.—A. K., 13, Elmwood Road, Bechamham.

TO MARKET NURSERYMEN.—A young man, well acquainted with all kinds of Market Nursery, wants a situation.—Letters to be addressed, BARTHOLOMEW, 33, Killo Road, Simebad, S. E.

A GENTLEMAN wishes to recommend his Gardener's Son, age 17, for a situation on in the Garden or Stable. M. Meade, Meade House, Redhill.

SEED TRADE.—A young man of experience in all branches now disengaged, as First, Second hand, or would take Management of Retail Business, also understands the Nursery and Cut Flower Trade. Highest reference.—R. J. LEE, 2, Campfield Terrace, Dundrum, Dublin.

EDGER CLERK. Many years' experience. Highest and most satisfactory references.—C. N., 15, Elm Gardens, Hammersmith, W.

To Seedsmen and Florists.
SHOPMAN (HEAD).—Thorough knowledge of Seeds, Bulbs, Plants, &c. Good reference.—C. T., *Gardener's Chronicle* Office, 11, Wellington Street, Strand, W. C.

SHOPMAN (ASSISTANT).—Age 21; eight years' experience. Good knowledge of the Trade in all branches. Good reference.—CORNFLOWER, *Gardener's Chronicle* Office, 11, Wellington Street, Strand, W. C.

HANBY MAN, in a Nursery.—Good Bricklayer, Carpenter, Painter, Glazier, Hot-water Fitter, and Greenhouse Fitter.—SAMUEL HILL, Forest, &c., Latimer Road, Forest Gate, E.

HOLLOWAY'S OINTMENT and PILLS.—Concise, Holloway's.—The soothing properties of these preparations render them well worthy of trial in all diseases of the lungs. In common colds and influenza the Pills taken internally, and the Ointment rubbed externally, are exceedingly efficacious. When influenza is epidemic this treatment is easiest, safest, and surest. Holloway's Pills and Ointment purify the blood, remove all obstructions to its free circulation through the lungs, relieve the overworked air tubes, and render respiration free without reducing the strength, irritating the nerves, or depressing the spirits. Such are the ready means of saving suffering when afflicted with colds, coughs, and bronchitis, and other complaints by which so many are seriously and permanently afflicted in most countries.

FOSTER AND PEARSON, BEESTON, NOTTS.

THE "CHILWELL NURSERIES" BOILER

(Registered).

EXPLANATION.

Water passes through the return Pipe into the Box A, thence through Pipes BBBBBBB to Box C, thence through Pipes DD to Box E, thence through Pipes FFFFFFFF to Boxes III, thence through Pipes IIII to Boxes KK, and thence into Box L.

PRICE LISTS AND TESTIMONIALS ON APPLICATION.

We can CONFIDENTLY RECOMMEND THIS BOILER for Heating Apparatus of 150 feet and upwards. We have had a number of these Boilers at work for five years, and THEY HAVE GIVEN GENERAL SATISFACTION. The Boilers are now also made with 2-INCH WROUGHT WELDED STEEL TUBES, which diminish the risk of breakage. THEY HAVE STEEL WATER BARS.

CHARLES FRAZER'S EXECUTORS, HORTICULTURAL BUILDERS, NORWICH.

Cash, Packages free. Extra plants for carriage.
H. L. HARDY, F.R.H.S., Stour Valley Nurseries, Bures, Suffolk.

SIMPLY AN ANNOUNCEMENT.

DID WORDS EVER SPEAK MORE PLAINLY? H. CLIFFORD, Esq., North End House, Crombill, Faldeth, R.S.O., December 20, 1889. Send me your Catalogue, as I intend giving you my order for seeds this year.

Mrs. JAMES SHORE, The Gardens, Lanesville, Torquay, January 4, 1890. Having seen the good results from your seeds in this district at several private places, I should be pleased to receive your Catalogue.
I. NEWTON, Esq., Devonport, Bournemouth, February 18, 1888. Of your Vegetable Seeds I believe every seed grower I admit though in some cases that one seed produced two plants. They were all the season unusually robust, and gave every satisfaction.
Mrs. O'NEILL, Colmar, Rathowen. I wish to say that, having tested most of the seeds supplied in England and Ireland for years, I found your supply more generous, the yield better and more certain than the others, and have this year decided on getting all the garden seeds from you.
Mr. T. J. FULLER, Campello, Plymouth County, Massachusetts, U.S.A. The Seed I had of you was seeds beyond my expectation.
G. B. WOLLASTON, Esq., Fish-gate, Well, Cheshunt, January 25, 1890. I have desired my gardener to order all seeds from your firm.
Mr. F. YOU ALL, Copthall, Crewe, January 14, 1890. It is with very great pleasure that I write to you as a future customer, having witnessed last summer a splendid garden, the result of your seeds.
Capt. BUNBURY, Eldon Park House, Capar, Eife, N.S.W. I take this opportunity of mentioning that the seeds you sent out to me at Sydney, New South Wales, last year, gave every satisfaction, and produced about 700 seeds.
Mr. T. ALLEN, Florist, 4, Neville Street, Abertillery, January 8, 1890. Kindly forward me your Catalogue, as I intend to buy the whole of my flower seeds from you during the coming season.
Mr. HODGKINS, Bucken, Epsomwood, Yorks., August 9, 1889. I have been so pleased with the productions from your seeds, that I feel I ought to thank you, and am counting on what the next lot will bring me.

MR. R. R. OSWALD, 2, Chapel Street, Birkenhead, February 19, 1888. Your seeds of exche. found ever the best I ever grew. I took eleven first prizes with them last year.
Mr. A. W. CHILD, Bolton Avenue, Belfast. The seeds I had from you last year gave every satisfaction. I got fearful rich bush from Germany two years ago—serve me right for trying foreigners.
Mr. G. SMITH, Louth, eps. Middleborough on Tees. Thanks for catalogue. I am less order as usual; last year was the tenth year that your seeds have been highly satisfactory. I am counting on the next.

Surely this is conclusive proof and a matter of fact, once and for ever, that KENT SEEDS excel all others in the world. CATALOGUE FREE.
PERFECT SEEDS ONLY direct from HENRY CANNELL & SONS, Nurserymen and Seedsmen to nearly all the Royal Families and "Houses" in the World. SWANLEY, KENT.

Bulbs and Seeds for Spring Planting. ANT. ROOZEN and SON, of OVERVEEN, HAARLEM, beg to announce that their New BULB and SEED CATALOGUE for Spring, 1890, is now ready. It contains full details of their extensive Collections of Gladioli, Dahlias, Lilies, Begonias, Freesia sinensis, and other Bulbs for Spring Planting, and also of a large Collection of CHOICE FLOWER SEEDS, which can be recommended with every confidence. The Catalogue will be sent, post free, an application to themselves direct, or their Agents, Messrs. MERRIES & CO., 3, Cross Lane, St. Mary-at-Hill, London, E.C.

PTERIS CRETICA CRISTATA.—Good stuff in large Thumbs of this best market Fern, 12s. per 100. Cash with order. DAMSONS and EMBERSON, Comely Bank Nursery, Walthamstow.

EAST LOTHIAN STOCKS A SPECIALTY.

True strain and extra fine, in five super-to-colours—Purple, Scarlet, White, Crimson, and White Wallflower-leaved—each colour 1s., 2s. 6d., and 5s. per packet.

Mr. GLEN, The Gardens, Brambletye, writes:—"Please send me five packets East Lothian Stocks. I must say that your strain of East Lothian Stocks is the finest I have seen anywhere. When I was at Westward the beds of East Lothian Stocks supplied by you were admired by every one who saw them. We had upwards of 50 per cent. of double flowers."

Mr. BAILEY, The Gardens, Eaton Hood Park, writes:—"The East Lothian Stock from you were excellent. The white, purple, and crimson exceptionally fine. Many spikes were over 18 inches long and densely clothed with bloom."

Mr. LAMONT, The Gardens, Kennet House, writes:—"Please send me four packets East Lothian Stocks. This year I have the finest I ever had. They are the admiration of every one who sees them. The Whites are over 90 per cent. doubles, which could not be better."

All other seeds of the same first-class quality only, notably the following all sared from my own world-renowned collections:

- PANSIES, show and fancy, 1s., 2s. 6d., and 5s. per packet.
- PENTSTEMONS, 1s. and 2s. 6d. per packet.
- ANTHRISUSMS, 1s. and 2s. 6d. per packet.
- MIMULUS, 1s. and 2s. 6d. per packet.
- ACRITOLA, Alpino, 2s. 6d. per packet.
- Stage, 2s. 6d. and 5s. per packet.
- PRIMULAS, each colour, 1s. and 2s. 6d. per packet.
- CINERARIA, 1s. and 2s. 6d. per packet.
- COCKSCOMB, extra grand competition strain, 2s. 6d. per pkt.
- BEGONIAS, Single, 1s. 6d.; ditto double, 2s. 6d. per packet.

Mr. ANDERSON, The Gardens, Abbotrule, writes:—"You will be pleased to hear that your seeds have done so well that I have not one single failure."
CATALOGUES now ready and post-free on application.

RICHARD SMITH & CO., WORCESTER.

GEO. JACKMAN & SON

beg to offer a large and well-grown stock of the following:—

- FRUIT TREES**—Of the leading varieties suitable for Market and Private gardens.
- ROSES**—Choice and Exhibition Varieties, selected Standards and Dwarfs, also in pots for forcing.
- RHOIODENDRONS**—Of the best named sorts, well set with buds; also Hybrid, seedling, and Youtcan, for shrubbery and covert planting.
- CONIFERS**—A Large Collection for Lawns and Pleasure Grounds.
- SHRUBS**—Ornamental and Flowering, adapted for Belts, Strubberies, Screens, &c.
- TREES**—Ornamental and Flowering, for Parks, Avenues, Streets, and Private Gardens.
- FOREST TREES**—For Coverts, Screens, &c., all grown by thousands.
- CLIMBERS**—In large variety for Walls, Trellises, Rockwork, &c., including their celebrated Clematis.

G. J. & S. have also to offer a **NEW CLEMATIS "MRS. BARN VELLARD"**—a handsome variety of the Jackmann type. It is a vigorous grower, bearing a profusion of distinct light lilac rose flowers, of medium size, from July to October. It can be offered to every collection. Price on application.

LANDSCAPE GARDENING—A leading feature. Plans made and Estimates given for Laying-out Estates, Public Parks, Cemeteries, Private Gardens, and Pleasure Grounds.

The New Descriptive and Priced CATALOGUE, free on application.

WOKING NURSERY, WOKING, SURREY.

BEGONIAS a SPECIALTY.—Awarded Four Gold Medal Seeds from Prize Plants. In beautifully illustrated Packets, choice mixed, Single or Double varieties, 1s., 2s. 6d., and 5s. per packet. Collections—Single, 12 named varieties, separate, 5s. 6d.; 6 ditto, 3s. 6d. Tubers, Named Singles from 12s. to 40s. per doz.; Unnamed Seedlings, 12s. to 24s. per doz.; Bedding, choicest, 6s. and 9s. per doz.; choicest Named Doubles from 12s. per doz.; Unnamed, very choice, 24s. and 30s. per doz.; choicest Mixed, 18s. per doz. Order direct from us, to procure our splendid strain. CATALOGUES gratis.

JOHN LAING AND SONS, Begonia Growers, Forest Hill, S.E.

PEARSON'S SEEDS are not ALL HOME GROWN; but some are imported from the Continent, and others are procured direct from Specialists, and sold to the Public without being re-christened. No effort is spared to give the best of everything. CATALOGUE free on application. Prices extremely moderate. No coloured plates, but value given in seeds. Established 1782.

J. R. PEARSON AND SONS, Chalfont Nurseries, Notts.

Brocoli—Good Sorts not Common in the Trade. **HARTLAND'S "APRIL QUEEN."**—Is a sterling Novelty from South of Ireland. Certainly one of the finest in cultivation, ready for use during the months of April and May. The heads are of immense size, and the leaves, which are most abundant and peculiar in colour, form such a thorough protection that the outer appearance, before being strip, is that of a "high quality" Cabbage. It has been grown locally to great perfection—some heads weighing over 14 lb., from the very close protection—white as snow.

WM. BAYLOR HARTLAND, Old Established Seed Warehouse, 24, Patrick Street, Cork. Wholesale, from HUIST AND SONS, London. Year Book of Seeds for 1890 now ready.

"Now is the Time to Plant Trees."

ROBERT NEAL begs to call the attention of Gentlemen, Local Builders, Builders, and others who intend planting this season, to his large and varied stock of Shrubs, Standard, Ornamental, and FOREST TREES, FRUIT TREES, ROSES, CLIMBING PLANTS, &c., which being well transplanted, are in fine condition for removal, and having been grown in the vicinity of London, are especially adapted for town and street plantings. Special quotations for large quantities, delivery free within a radius of six miles of the nursery. Inspection of the stock solicited. CATALOGUES free on application. Also to offer extra fine forcing SEAKALE and RHUBARB. The Nurseries, Trinity Road, Wandsworth Common.

CLIBRAN'S

ILLUSTRATED SEED CATALOGUE,

112 pages—Post-free for Three Stamps.

Will interest you. It contains the best of the old reliable sorts, both in vegetables and flowers; besides many rare, novel, and beautiful introductions from different parts of the world, and which are not to be found in any other list. Special sections are given to "Poppies," "ANEMONES," "CHINESE PEAS," "SWEET PEAS," &c.; the whole perhaps forming the most complete Seed List of the season.

THREE NEW CHRYSANTHEMUMS,

TO BE DISTRIBUTED THIS SPRING.

Annie Clibran.—A lovely sport from Mille, Leroux, opening a charming violet-rose, shading off with age to a lovely French white. Splendid exhibition variety; and one of the best for cut flowers. First class Certificate National Chrysanthemum Show. 5s. each, three for 12s. 6d.

Mrs. Horril.—A reflexed sport from George Gleny and of the same colour. Sprays of this charming novelty have been grown by Mr. Molyneux nearly 2 feet long, and clothed with flowers from top to bottom, the cut blooms lasting eighteen days. One of the very best for cutting or decoration. 1s. 6d. each.

Ralph Brocklebank Improved (Jap.).—Of a richer and deeper yellow, and certain to supersede its parent for exhibition, being so much brighter and more telling on a stand. 1s. 6d. each.

CHRYSANTHEMUMS.—Extra choice sorts, 1s. and 6s. per dozen (one selection). The finest older varieties (cut selection), cuttings, 2s. per dozen, 15s. per 100, post free; all named. Special List post free.

CLIBRAN'S TOMATO.

Undoubtedly the best of the very best varieties yet introduced. A swelling selected and re-selected year after year from the "Orangefield" and is, without doubt, the most handsome Tomato ever seen. Awarded numerous First Prizes. Sets three and four fruits to a joint. *From a joint 1 1/2 feet long, 1 1/2 lbs. of fruit were cut weekly for months. Flavour rich and juicy.* 1s. 6d. and 2s. 6d. per packet.

LEMON OIL INSECTICIDE.—Four cardinal points why this is superior to any other—
 1st, because it is more efficient.
 2nd, because it is so cheap.
 3rd, because it is safe and harmless to tenderest foliage.
 4th, because it is to be trusted in the hands of the most careless operator.

IT IS FAST BECOMING THE ONLY INSECTICIDE USED BY MANY OF THE LEADING GARDENERS.
 1 pint, 1s. 6d.; quarts, 2s. 6d.; half-gallons, 5s.; gallons, 9s.; four gallon tins, 31s.

EUCHARIS MITE KILLER. This has now been a year before the public; and during that time it has saved thousands of bulbs which would have been consigned to the rubbish

heap; vide numerous testimonials. Bulbs are now to be seen at our Nurseries showing spikes and healthy leaves, 4 to 12 inches long, which four months ago were leafless and eaten by mites all over, and into the "scales." Half-pints, 1s. 6d.; pints, 2s. 6d.; quarts, 4s. 6d.; half-gallons, 7s. 6d.; gallons, 12s. 6d. All principal Seedsmen and Nurseries, or from Clibran's.

CLIBRAN'S—ALTRINCHAM.

WEBBS' SENSATION TOMATO.

The finest variety extant. See Testimonial below. 1s. 6d. and 2s. 6d. per Packet, Post Free.

From Mr. GEO. HAWKINS, Gardener to Col. Tuberville, *Essex, Essex, Gardeners' Chronicle*.
 "Last year I grew your Sensation Tomato in pots, and it gave me such satisfaction that this year I grew it out-of-doors, in different places and aspects, and it has done wonderfully well in every place. I never had a Tomato to fruit so freely, and such large fruit, without any thinning. I put fifteen plants on the wall outside one of our pots; the wall is 2 feet 6 inches high, and 50 feet long, with a border only 9 inches wide. I had gathered some ripe fruit, and I counted the remainder—there were 670 fruit—and twelve of them weighed 8 lb. 10oz."

SPECIALTIES FOR 1890,
 And Everything needful for the Garden.

LANGPORT, SOMERSET.

A SPLENDID NEW MAINCROP PEA.

SUTTON'S PERFECTION MARROWFAT PEA.

This is now being sent out for the first time, with the certainty of its giving entire satisfaction. It possesses a robust constitution, produces a great profusion of straight, handsome pods, which are exceedingly valuable for exhibition on account of their size and dense covering of bloom. The flavour of the Peas is delicious.

Reports from well-known authorities.

"The finest Dwarf Marrow Pea I have ever grown. Strong habit, nine and ten Peas in a pod, of large size and excellent flavour."—Mr. J. TROG, The Gardens, Bearwood.

"A most magnificent Pea, which I specially recommend for its remarkable productiveness. Habit robust, resists mildew better than most other sorts. Pods straight, broad, and closely filled with very large Peas, some pods containing from eleven to thirteen Peas of a dark green colour, and exceedingly rich and sweet in flavour."—Mr. S. COLBERT, The Lodge Gardens, Farborough.

Price, 1s. 6d. per packet.

NOVELTIES
OFFERED BY
HERM. A. HESSE,
NURSERYMAN,
WEENER (HANOVER), GERMANY.

The Novelties enumerated below are raised from Seed in my Nurseries, and are now offered to the Trade for the first time.

JUNIPERUS VIRGINIANA AUREO SPICA (Hesse).

A beautiful plant, which was found in my nurseries among seedlings of the Virginian Cedar. The terminal shoots of this beautiful plant are in spring of a brilliant golden-bronze, whereas the older leaves assume a beautiful green. The colour is much heightened by full exposure to the sun. We seldom find this brilliant golden tint in any plant.

110 inches high, 12s. each.
15 to 12 inches high, 10s. each.

ACER PLATANOIDES FOLIIS ELE-GANTER VARIEGATIS (Hesse).

A remarkably fine, very interesting, most striking, and very distinct variety of the Norway Maple, raised from seed in my nurseries several years ago, and much admired by visitors. On first appearing, the leaves are nearly white. Afterwards most of the leaves are marked with a regular white pattern. Here and there we find some leaves all white, or half white and half green, but all are perfectly developed, and a very important quality is, that they never suffer from the heat of the sun, as is often the case with trees having variegated foliage. These produce these beautiful markings unaltered till autumn. This beautiful tree will be valuable for producing decorative effects in pleasure gardens.

Half standard, 25s. each.

THUIA OCCIDENTALIS WARREANA LUTESCENS (Hesse).

A very fine variety of Thuya Warreana, of compact growth, grown here and introduced into commerce by me some years ago. The leaves are alternately of a shining light yellow and of a darker yellow tint. It has all the superior qualities of Thuya Warreana, is very hardy, and is of a beautiful habit. Mr. Bessner, Inspector at the Gardens at Bonn, writes on this subject:—"See it one of our trellis-planting auto, which is a 'soil-former'." It is an excellent and very effective form. Though introduced into nurseries years ago, it is not yet so much known, because other varieties similarly named but not worth cultivating, are substituted for it.

8 to 12 inches high, 2s. each, 15s. for 10.
12 to 16 inches high, 3s. each, 20s. for 10.
16 inches high, 4s. each.
20 to 24 inches high, 5s. each.
3 feet high, 12s. each.

Rare and Recommended Plants.

ABIES AMABILIS (Forbes).

A fine and very hardy silver Fir, introduced by Douglas in 1831 from Oregon territory, but which, strange to say, was not cultivated, and has remained entirely unknown. Only seven years ago I succeeded in getting seeds direct from its native country, which, in spite of all my efforts, I had not only once again. In nurseries we seldom find it genuine. What we receive under this name from Holland or from France is mostly *A. magnifica* (Murray) G. Donnell. In its young state it resembles *A. nobilis*, and has often been mistaken for that species. The leaves are longer than those of *A. nobilis*, straight, glossy green above, with a sunk line along the middle, and with two rounded alar nerves beneath. A very striking and pleasing plant, on account of its feathered terminal branches, and the peculiar deep bluish-green of its foliage.

8 to 12 inches high, 1s. 6d. to 2s. each, 12s. for 10.
12 to 16 inches high, 4s. each, 20s. for 10.
16 to 24 inches high, 5s. each.
20 to 24 inches high, 5s. each.

PICEA OMORICA (Panic).

Mr. Panic found this remarkable and fast-growing species in Servia. It has very long and also short pointed and prickly leaves, white underneath. When these trees grow older, the leaves turn, as is the case with all the Fir trees of its group, so as to show at the same time their white and green sides. This is a very interesting and effective species, and deserves to be much propagated. See illustration in *Gardener's Chronicle*, Mar. 1, 1884, p. 390.

Plants on main roots, 8 to 10 inches high, 2s. 6d. for 10.
8 to 12 inches high, 10s. to 15s. each.

PSEUDO-LARIX KEMPFERI.

Seedlings, 2 1/2 to 5 inches high, 1s. 2d. for 100 plants, 16s. to 24 inches high, 2s. to 4s. each.

WHOLESALE CATALOGUES
can be had on application.

HARTLAND'S
GOLDEN QUILLED
SUNFLOWER,
"SOLEIL D'OR"

WILLIAM BAYLOR HARTLAND submits the following relative to the merits of this plant. He has no other means than with such testimony of adding force to what has already been written on the subject. There is no doubt the Irish variety is quite distinct from that known in England, and he is sincerely obliged to Messrs Pearson, Backhouse, Payne, and Cullingford for what they have written him on the subject.

Strong Plants (Orders now in strict rotation), 12s. per dozen: 1s. 6d. each.

Dozen lots post-free.
Single plants 3d. extra for postage.
Trade Terms on application.

Your Soleil d'Or Sunflower is certainly perfectly distinct from the ordinary form grown in this country, and is, we think, rather richer in colour. It will be a decided acquisition to our English gardens.

"A. AND C. PEARSON,
"Chilwell Nurseries, Notts."

We like your Soleil d'Or Sunflower very much. It is now in flower, much in advance of the ordinary form.

"JAMES BACKHOUSE AND SONS,
"Nurseries, York."

Your box of Soleil d'Or Sunflower blooms to hand. I am much obliged for your sending them. Several of the blooms are much finer than the drawing or illustration you publish, and they form a really attractive and agreeable vaseful.

"C. HARMAN PAYNE,
"Thorn Road, South Lambeth, London, S.W."

Dear Mr. Hartland,—I am writing to tell you how very pleased I am with your quilled herbaceous Sunflower. I have grown nearly all the varieties of Sunflowers for many years, but of all the double flowers I consider this the very best.—Yours truly,

"W. H. CULLINGFORD,
"Earl's Court, Tulse-hill, London."

The plant has also been sent to Kew and Chiswick Gardens for trial, and **PRONOUNCED QUITE DISTINCT.**

SATURDAY, FEBRUARY 1, 1890.

TEA ROSES AND THE CON-FERENCE.

WHAT we are to learn a good deal from the Conference papers more than was perhaps learned at the Conference itself—is, I think, very clear, although some of the lessons which we learn are of a somewhat peculiar character; but I think the first and chief lesson is the very great amount of labour which our excellent Secretary has devoted to "licking into shape" the numerous reports he had to tabulate. When one considers Mr. Wilks' multifarious duties (none of which are neglected), one can but instance him as another proof of the saying that it is the busiest men who find most time.

Passing to the Roses themselves, one is at once struck with the marvellous strides that the Tea Rose has made in the estimation of the Rose-loving public during the last quarter of a century; we have seen the votes given by seventy-five persons who consider themselves more or less qualified, I presume, from personal experience to give their verdict on the best varieties grown. I am afraid I shall have to show that a goodly number must be classed amongst the *less*, but it only confirms what those of us who look back and compare notes often state; but there is one thing which very clearly shows this. I have before me (through the kindness of my friend, Mr. W. J. Jefferies, of Cirencester), a slip from the *Gardeners' Chronicle* of June 25, 1862, which contains the list of prizes awarded at the Royal Horticultural Society's Great Rose Show, which had succeeded to the First Great National Show, and in that list I find but one class for Teas and Noisettes, and so meagre was the exhibit that no first prize was awarded; and there appears to have been only two exhibitors, and curiously enough these hailed from that home of the Tea Rose—East Anglia; one of them, Mr. Hedge has long since passed away, but the other, Mr. Ben Cant, is still with us. I wonder what he would say to his box now if it could be presented to him as it was in those days. Now take the last show of the National Rose Society, in

which there is a separate division for them, and in that division there are ten classes, and all these classes were well filled, but many exhibitors drew blanks; and there is no doubt that a change for the better is in progress, that the very beautiful varieties known to us now which were unknown in those days (for it was the year before Marseñal Niel made its appearance) have induced a large number of Rose lovers to cultivate what used to be considered, with all its beauty, a class only suited for very warm soils and situations. By-the-by, it is a curious fact, which I daresay very many of our exhibitors have forgotten, that in those days in class 1 for nurserymen, instead of seventy-two distinct single blooms, there were ninety-six, three trusses of each!

I have said that a good many of these lists sent on to the Conference must have come from persons who had but little knowledge of the class. Thus I find that some persons gave their votes for Grace Darling as being amongst the best varieties. It may be said, perhaps, that there has always been a doubt as to the position of this Rose, but there were those who gave their votes for Cheshunt Hybrid and Lady Mary Fitzwilliam, which have been unmistakably proved to be hybrid Teas, and no more entitled to belong to this class than Captain Christy or Her Majesty; while one voter has actually included in the best twelve Teas, *Souvenir de la Malmaison*, a true Bourbon. I do not wish to know who this intelligent voter is—he is admittedly a “free and independent elector.” *Primrose Dame* and *Vicomtesse Folkestone* are also included with hybrid Teas, although classed by some voters amongst Teas.

Equally remarkable, too, is the fact that amongst exhibition Teas some voters have recorded their approval to such kinds as *Madame Falcot* and *Homer* as amongst the best twelve exhibition Teas. I wonder whether these gentlemen ever saw a bloom of the former on an exhibition stand? I never did; perhaps it may have appeared at a provincial exhibition, when in August and September many funny things do duty as Roses—it opens its eye almost immediately it is brought into the house, and would probably wink and smile benignly on the deluded individual who had tended to its budding charms. No again, *Homer* is pretty enough as a decorative Rose for a garden, especially when it can be had with its pretty pink tinge on the edges of the petals, but utterly unsuited for an exhibition stand, both from its roughness, and small size. I am surprised, too, that six voters should have recorded their votes for *Gloire de Dijon*. I think sentiment must have got the better of judgment in this case. It is such a universal favourite as a garden Rose, so hardy, so accommodating to all climates and situations, that I daresay its admirers did not like to exclude it, yet it is a very broken reed to lean upon. You may cut a beautifully looking cupped bloom, but by the time it is placed on the exhibition-table it has opened into a confused looking and damaging flower, and no experienced exhibitor will venture to put that flower amongst such flowers as *Souvenir d'Elise*, *Comtesse de Nadaillac*, *Innocente Pirola*, or others “of that ilk.”

I am not quite so surprised at the wonderful difference of opinion as to the hardness or otherwise of different varieties, although it is somewhat perplexing to find some electors placing *Madame Casin* amongst the hardiest, and some amongst the most delicate, but there are many idiosyncracies amongst them as amongst amateurs; for instance, I have *Comtesse de Nadaillac* making shoots 3 or 4 feet long, while a friend told me of some plants whose wood was as thick as one's forefinger, and that he was going to bud from this; and I feel sure that in like manner, there are plants of many varieties which differ from the normal growth, and that where this is the case, a strain may be got up and distributed for the benefit of Rose growers generally.

After all, this is not one of those cases in which the multitude of councillors imply wisdom, for even amongst the first twelve which head the list, there

may be exception taken; for instance, beautiful as *Madame Van Houitte* is, I should never think of placing it as an exhibition flower above *Anna Olivier*, and yet it appears to have double the number of votes. There is evidence that a good many of these lists have been given by persons who never exhibited a Tea Rose; and as far as a guide for exhibitors or amateurs commencing to grow Teas is concerned, no more reliable information would have been obtained from a dozen of the best exhibitors.

NEW OR NOTEWORTHY PLANTS.

CALANTHE VEITCHII ALBA.

A BEAUTIFUL pure white *Calanthe* was sent to Kew the other day, by Sir Charles Strickland, Bart., of Hildenley, Malton, Yorkshire, with the information that it was raised from *Calanthe vestita* and *C. rosea*; thus, it comes from the same two parents as produced *C. Veitchii* ×, and therefore may bear the above name. It is a form of spotless purity, for there is not the slightest trace of colour anywhere, and is therefore a great acquisition. The one other difference from the typical form is, that the lip is a little more distinctly four-lobed; in fact, it partakes more of the character of *C. vestita*, while typical *C. Veitchii* × takes more after the other parent, *C. rosea*. The total absence of colour is interesting, for I do not remember to have seen a form of *C. vestita* without either a red or a yellow spot at the base of the lip, though the closely allied *C. Turneri nivalis* is entirely destitute of colour.

PHALANOPSIS CYNTHIA, nat. hybr.

There are three supposed natural hybrids between *P. Schilleriana* and *P. Aphrodite* (anabiis of gardens), viz., *P. leucorrhoda*, *P. casta*, and *P. Sandersoniana*, but the present one seems to be quite distinct from either of them, though obviously derived from the same parentage. It appeared as an imported plant in the collection of F. Wigan, Esq., Clare Lawn, East Sheen, and, as it seemed distinct, was brought to Kew for determination, and a flower left for preservation in the Herbarium. It is an exceedingly beautiful thing, with much of the general appearance of *P. leucorrhoda*, though instead of the long tendrils of *Aphrodite* it has the short ones of *Schilleriana*, but a little more slender towards the apex. The side-lobes of the lip, however, are large, and far more like those of the other parent, while the unbranched raceme also comes from *P. Aphrodite*. The vegetative organs, that is, the roots and leaves, are almost if not quite indistinguishable from those of *P. Schilleriana*, so there can be no doubt we have here another natural hybrid between the two species. The sepals and petals are rosy-blush at the base, gradually shading off to nearly white at the margins; the inner halves of the lateral pair having numerous small rose-purple dots below the middle. The front lobe of the lip is bluish-white, suffused with yellow near the base, where also are numerous spots and lines of light purple; these become fewer and paler in the upper half. The side-lobes have a similar ground colour, with a few large crimson-purple spots near the base, and a few smaller and paler ones in front. Column and crest as in *P. Schilleriana*. I have not before seen this elegant thing.

LYCASTE LASIOGLOSSA, Rehb. f.

This very interesting *Lycaste* seems to be rather rare in collections, perhaps on account of the want of brilliancy of colouring in its flowers, though the defect is somewhat atoned for by their size and lasting qualities. It has the general appearance of *L. plana* and *L. Schilleriana*—of the latter especially, on account of the long sepals and rather short petals. The lip, however, is very peculiar, having the front lobe totally covered with long villous hairs, which readily distinguishes it from the species just named. The sepals are olive-green outside, becoming browner towards the margin, light purple-brown inside, with a close arachnoid pubescence near

base. The petals and lip are pale yellow, the latter as well as the column having a few pale red-purple markings near the base. It was introduced from Guatemala by Messrs. James Veitch & Sons, of Chelsea, and was described in these columns in 1872, p. 215, and a figure was given in the *Botanical Magazine*, t. 6251. A specimen came from Mr. Godefroy Lebeuf, of Argenteuil, France, the other day, for determination, but whether it was derived from a fresh importation or otherwise I am unable to say. R. A. Rolfe, Herbarium, Kew.

VANDAS.

On looking through Messrs. B. S. Williams & Son's nursery recently, I remarked the fine condition of the extensive collection of large plants of *Vanda*. These plants are furnished with healthy leaves from top to bottom, and are from 5 to 6 feet high. The nursery is, and has been long famous for these plants; and grown, as they are, within the area of London fogs, their condition is admirable. Londoners have been hoping against hope that the deleterious effects of fog may be lessened, but it is a fact that matters have gone from bad to worse, even within the last decade; and a leading grower of winter-flowering Heaths and other things for the market told me, that plants which did well in his nursery ten years ago cannot now be grown so as to give satisfaction. It may therefore be satisfactory to orchidophiles to know that their favourites may still be grown to a high state of perfection while many other plants are worsted.

The system of culture pursued in the Holloway Nurseries has not been altered for many years, the result hitherto being so satisfactory. The house where the *Vandas* are grown is span-roofed, and of a height suitable for such tall plants. *Vandas* require but little shade—only enough to prevent scorching in hot weather—and the plants almost touch the roof. Mr. Williams says, the less shade they have the better they will flower—and they do flower well here, most of them twice in the year. The house is heated by three rows of 4-inch pipes, which pass round the house, and there are four zinc evaporating troughs, fitted on to the pipes, for use in the summer. The winter temperature is kept at about a minimum of 60°, and raised to 65° by day. Other important details of their management consist in giving air when the temperature rises to 65°, and damping the paths, walls, &c., morning and evening if the air be dry, the application of moisture depending upon the weather to a large extent; little is required at the present time, and none at all while the atmosphere is laden with fog or saturated with moisture. In summer, abundant supplies of moisture are found necessary, and it does the plants most good if it be evaporated from the stage on which the plants stand. The plants are rarely syringed over, and care is taken not to sprinkle water on the hot-water pipes when these are hot. The potting material employed for *Vandas* is sphagnum moss, and the pots used are new or very clean ones. The smaller growing species are commonly grown in hanging baskets of teak wood.

White scale, which infests the plants, is destroyed with soap-suds and a sponge. Fumigation with tobacco smoke is injurious, and causes the lower leaves of *Vandas* to fall off. The plan of steaming a house with tobacco juice now practised at these nurseries does not produce any such disastrous result, and effectually disposes of aphid and other insects. I was fortunate in seeing a thanatophore in action. The operation is easily performed and the insects are effectually destroyed without injury being done to *Odontoglossum* or *Miltonias* of the *vexillaria* or *Roezlii* types.

There were some handsome spikes of bloom to be seen, notably a long one of *Vanda suavis*. Three forms of *V. tricolor* were in flower, one supposed to be the typical species, with sepals of pale yellow, spotted brownish-red, and the lip tinted with rose; *V. tricolor insignis*, not the true *V. insignis*, but a good form of *V. tri-*

color; the sepals and petals more brightly spotted, and the lip pale rosy-lilac; *V. tricolor formosa*, more richly coloured, and densely spotted than the type; *V. t. var. Patersoni* is a beautiful form, which flowers whilst still quite small—the flowers, 2 inches in diameter, have cream-white sepals and petals of great breadth, densely spotted with cinnamon-brown, and the lip is bright magenta (see fig. 21, p. 133); *V. Denisoniana unicolor* had the outer surface of the sepals and petals of a brown colour.

All the year round spikes of *Vandas* in great

blotched and spotted reddish brown, with a broad rosy-tinted lip.

There are several more species of *Vandas* that cannot be omitted from any collection of Orchids worthy of the name; notably, the distinct and handsome *V. coriacea*. At one time it was an expensive plant, but, thanks to the enterprise of importers, the day of high prices is gone not to return. It is free to flower, and its long spikes of large and delicate blue blossoms command the admiration of everyone in October and November. A word of

is the noble *V. Sanderiana*, a native of one of the Philippine Islands, and requiring therefore a high temperature. The flowers, quite 4 inches in diameter, are freely produced. Like *V. cœrulea* it grows on the tops of trees, where it gets but little shade; I saw it quite recently growing and flowering freely in the Rev. F. D. Horner's garden at Lowfields, in an intermediate temperature, where *Cattleya citrina* was likewise growing well; it was quite near the roof in a house that was well ventilated. It may be found to succeed admirably with the usual collection of *Vandas*, which require only a moderate amount of heat. There is also the grand *V. suavis*, which is a valuable exhibition plant and blooms at various periods (see figs 20, 22). The still more recent *V. Amesiana* and *V. Kimballiana* are important additions, which while being distinct and beautiful are not expensive. *J. Douglas*.

NOTES FROM MUNSTEAD.

Midwinter is not the best time in which to visit a garden of herbaceous and alpine plants, but when compared with those which are devoted chiefly to bedding-out, and where the winter or spring fashion of filling the beds does not obtain, then the former is not only more interesting and effective, but has also the advantage of always having something in flower which may be cut for the flower-glasses; and, moreover, in a mild winter like the present, such a garden is capable of yielding a quantity of beautiful and useful flowers. Amongst the foremost at Munstead, Godalming, at present, and for some time past, is *Helicoborus niger*, of which there is a large colony of the best selected early and late types, all flowering abundantly; and Mr. Gerrard tells me that he often cuts at one time hundreds of spotless snow white flowers, and one can easily imagine such a charming sight these must be when culled in all their pristine beauty. It need scarcely be remarked that they have a congenial home, and are well cared for; and the situation chosen is one adapted to their requirements.

It is a somewhat circular little dell, near to the edge of a wood, sheltered and shaded by old and rather stunted Scotch Firs with comparatively few branches, except near their tops. It must not, however, be thought that the *Helicoborus* are densely shaded, for the sunny side of the dell is fairly open, admitting plenty of light, yet the raised side of the dell shields the plants from the direct rays of the sun, but on the opposite side the sun evidently will strike with full force. And here another hint may be gleaned by those who wish to know what to plant on a dry and relatively sterile bank. Such a bank is here planted with *Helicoborus fortidus*, which grows and flowers splendidly, its dark green leaves contrasting finely with the long panicles of light green flowers.

As grown here it is certainly a striking and ornamental plant. Another similarly striking plant is the old *H. lividus*, with its erect stems and tuft of triid glabrous leaves, with oblong pointed, sharp-toothed segments. There are also large established masses of the best varieties and species of *Aquilegia*, and other moisture-loving plants which in due season maintain the show in this flowery dell. Passing thence to a secluded woodland grove, we see immense quantities of hybrid Primroses, which are now giving promise of a great floral display; and even already many of the Harbinger type give colour to the scene. There is also found a mass of the Giant Snowdrop, then a colony of the bright yellow Winter Aconite, the purple *Helicoborus colchicus* or the white *H. orientalis*; and large spaces are carpeted with such plants as *Thymus serpyllum var. lanuginosa* or *Dryas octopetala*; and suddenly peeping out from beneath a few Spruce branches, as if quietly gone to bed for the winter a large mass of that curious member of the Crotas family—*Opuntia Rafinesquii*, with its curious thick fleshy leaf-like branches, is espied. A plant which is much appreciated here is *Leontotis Leonurus*, with its whorls of scarlet, Salvia-like flowers. It requires, however, the protection of a cool house.

FIG. 20.—VANDA SCAVIS TO SHOW HABIT. (SEE P. 132)

variety of form and colour may be seen. The old *V. Roxburghii* was there—a beautiful species, and the first to flower in England. *V. teres*, a very free-growing plant of great beauty, likes more warmth than others; indeed, at Great Gearies in the house has been found for them, do not move them about. They like a light, airy position, and in the resting period to be kept cool at night. In their native habitat, the temperature falls to the freezing point, and the plants are exposed on the boughs of trees. They do better in cylinders of oak wood than in pots. The pretty *V. cœrulea* and *V. var. Boxallii*, more recently introduced, are always admired when in flower.

In strange contrast to this pretty little thing, there

caution may be useful here; that is, never to purchase plants which are in an unhealthy state; and again, when once the right place in the house has been found for them, do not move them about. They like a light, airy position, and in the resting period to be kept cool at night. In their native habitat, the temperature falls to the freezing point, and the plants are exposed on the boughs of trees. They do better in cylinders of oak wood than in pots. The pretty *V. cœrulea* and *V. var. Boxallii*, more recently introduced, are always admired when in flower.

and here this kind of protection is afforded by a cool conservatory. The plants are large ones, and are grown outside in summer, and housed on the approach of frost. The conservatory is a structure of no great size, artistically arranged with an easy winding path down the centre, which touches a bit of rockwork, or skirts a miniature bit of water, over and around which *Ferns* ramble at will. Although the house was filled to overflowing, yet it contained few of the things which may be called florist flowers proper, but instead, we find such plants as the sweet-scented *Daphne indica*, laden with hundreds of its corymbose flower-heads, *Heliotropes*, *Salvias*, *Veronicas*, some interesting species of *Calceolaria*, &c. The walls and rafters are furnished with *Akebia quinata*, *Stantonia* species, *Lardizabala biternata*, and *Physianthus pungens*, together with many quaint species of *Asparagus* and *Ruscus*. In a house such as this there is always something to attract and to interest—indeed, Miss Jekyll's garden, with its great wealth of plants varying in character as the seasons change, has always something fresh and interesting to be seen, visit it whenever you may. F. B.

NURSERY NOTES.

MR. BULL'S ORCHIDS.

Is a recent visit paid to Mr. W. Bull's New Plant Nursery, King's Road, Chelsea, we were fortunate to find in his many houses numerous good things coming into bloom, not enough of them certainly to furnish his now well-known show-house, but still sufficient to make a visit at this season, of interest. The first house visited contained a collection of *Odontoglossum Alexandræ*, many fine varieties throwing their arching racemes of white flowers over the side-benches. Of species that will continue to open for several months yet, hundreds were noticed, and many were still hidden within the growths. The two natural hybrids, *Odontoglossum aspersum Hamannum*, and *O. aspersum* were observed, the first-named being much the better flower. In the same house grew *Zygopetalum crinitum rabrovenosum*, with red veins on the lip, and numerous brown spots on other parts, that contrast well with the general blue colour of the lip. A dark red *Lycaste Skinneri*, named *rubella*, was noted, but the varieties of this Orchid are almost without end; and in a much warmer house some excellent forms of *L. S. alba*, a pure white and large flower, and an equally large but creamy-white flower, with some yellow in the throat, were noted, the latter having the name *L. S. a. lutescens*; for purity of colour, the first-named is by far the most effective. To return to the *Odontoglossum*-house, the curious *Pleurothallis scapha* was just expanding its tailed *Masdevallia*-like blooms; and *Odontoglossum maculatum erosum* and *O. maculatum* were showing blooms.

In this house were *Oncidium chrysomorphum*, a spike densely filled with small yellow flowers that would be an effective object when of a large size; the beautiful *Odontoglossum cirrosium Hrubyanum*, and *Ada aurantiacum*.

Masdevallias at this nursery are very well grown, the stock being in leaf dark green, sturdy, and very clean. The night temperature maintained at this season does not exceed 40°, and that for the day 50° to 60°. There were but few in bloom, and *M. militaris*, with the rich crimson veins on a lighter ground, was the most striking of these.

Oncidium macranthum, always a remarkable feature here, promises to make a finer display than usual. These plants occupied a house with *Odontoglossum Rossi majus*, many of which bore flowers: *O. blandum*, *O. Pescatorei*, *O. Leopardinum*, a few *Colax jugosus*, *Lælia anceps Sanderiana*, *L. a. grandiflora*, and *L. a. Eyrmanniana*, a pale form, with light purple tips to the petals and sepals. Other forms of this favourite winter flowering Orchid were noticed in *L. autumnalis*, *L. anceps rubra*, and *L. albida Marianne*.

Many *Cypripediums* in flower, including *Dauterhi*, *callosum*, *regale*, *gemmiferum*, were found in a house

kept some degrees warmer than any other previously entered. In this house was a nice strong specimen of the rare *Oncidium splendendum*, carrying some few blooms—a showy and effective plant when well furnished with its curious barred flowers, which have a peculiarly large, yellow lip. The free flowering, fragrant *Saccolabium giganteum*, with sepals and petals of white, *Aemethyst* spotted, and cuneiform lip of mauve was noted to be in bloom; it is an invaluable plant for winter, and lasts about six weeks in good condition. Another fragrant plant met with in bloom was *Phlamma nobilis*; it is of a pure white, and carried many flowers. One of the prettiest, *Sophranitis violacea*, was in bloom; also the bright-coloured *S. militaris*, the most brilliant of them all, had a few blooms left, but the display was virtually at an end.

The large half-span house given up to *Lælia purpurata*, *Vandas* of most species, *Cattleyas* mostly *Trianae*, *Percivallianum*, &c., was, as usual, crammed with big specimens, whose every growth contained a flower-sheath, and gave promise of a fine display in due season. Every plant looked healthy, and was certainly remarkably free from insects or blemishes. A few *Cattleyas* had opened a bloom here and there—*C. Trianae alba*, very pure in colour, and still rare; *C. T. delicata*, *C. Percivalliana marginata*, a rich-coloured flower. A specimen of the grand *Ansellia africana* was throwing a few of its clusters of rich brown and yellow flowers from the apex of the tall stems. It is a very abundant and enduring bloomer.

In the houses which lay behind the great show-house we found some *Phaius Blamei*, with many spikes of its yellow and light brown flowers, also of the much longer known *P. grandifolius*, some hybrids of *Cypripedium insigne*, *C. Warneri*, and *C. Spicerianum*. The fine *Veitchiana* hybrid, *C. Arthurianum* (two plants) was in flower. It is a pretty study in light browns, colours that are obtained from the parents, *C. vexillarium* and *C. insigne Maulei*. The new *Vanda Amesiana* and many of *Phalaenopsis Schilleriana* were in bloom, but the fog had dimmed the blossoms of the *Phalaenopsis* most pitifully.

The sweet-scented *Dendrobium heterocarpon* perfumed the air in one house visited with the odour of Violets. Many *Coleogyne cristata*, and including amongst them numbers of the *Chatsworth* variety, were seen in a house with *Vanda suavis*, *V. tricolor*, and other *Vandas*. The interesting Orchid, *Catasetum Darwinianum* was nicely in flower. The *Cymbidiums*, growing as freely as grass, were the last of the Orchids observed. Of course, we saw nothing in bloom, and were left to admire the extreme healthiness of the stock of *C. Lowianum*, *C. eburneum*, *C. Hookerianum*, *C. Mastersii*, and many more. The temperature of the house seemed to us to be rather low, and in answer to our inquiry, Mr. Bull replied that the temperature at night at this season was maintained at about 45°, rising to 50°, and to 55° with sunlight. A graceful *Palm* of light appearance, and well suited, amongst other uses, for indoor and table decoration, was observed in *Phoenix hybrida*, a *Palm* raised, we were told, in India. Mr. Bull seemed to have a good stock of it.

THE TERRACE GARDENS, RICHMOND, SURREY.

SEE SUPPLEMENTARY SHEET.

Few English-speaking persons are ignorant of the beauties of Richmond and its neighbourhood a fact acknowledged centuries ago, when royalty built its abodes on the outskirts of the little town in what was, in Henry VIII.'s time, a very extensive park, and at Sheen and Petersham. The Dukes of Buccleuch possessed landed and other property at Richmond, and the beautiful wooded slope which stretches down from the crest of Richmond Hill to the river formed part of it. It is separated from the river by the lower or Petersham Road, and a narrow strip of land beyond. The estate was some three years' ago in the market, and

great fears were expressed lest the builder, ever on the look-out for "eligible sites," would lay his hands on it, cut down much of the timber, and build villas, or what not. But through the exertions of Sir Whittaker J. Ellis, a citizen of London, resident at Richmond, the town became the possessor of a portion of the property.

The ground was planted originally with great good taste, and it is now, in June and July, before the summer suns have browned the lawns, a most enjoyable place.

The trees are getting much crowded—spoiling each other, in fact; and the judicious use of the axe is much needed. Fresh soil and manures around trees and in the shrubberies, and the liberal use of the water hose in the summer are things much needed.

The views from the crest and upper parts of the hill over the country and river in front, are acknowledged by all who have seen them to be very charming. Our supplement illustration is reproduced from a photograph by Messrs. Byrne, of Richmond.

RAILWAY CHARGES FOR SMALL PARCELS.

My attention has been directed to the letter from Mr. Farrance in a recent issue, p. 86. The comparison made by him is as between "actual rates," *i.e.*, rates now charged, and "maximum rates" now proposed for smalls. The comparison made in your article, referred to by him, is as between "maximum rates" originally proposed by the London and North-Western Rail. Co., and "maximum rates" now proposed by that company. In the case of the Great Eastern Rail. Co., the original proposal was to charge for smalls "such reasonable sum as the company may think fit." This was the same in the case of each railway company, except the London and North-Western Railway Company and the Great Western Rail. Co. The former company proposed to charge, as stated by you, "double rates and charges in class 5." This would give for conveyance, 10*l.* per ton per mile for first 20 miles, 9*l.* for next 20, 8*l.* for next 20, and 7*l.* for remainder; and for terminals-station, 4*l.* per ton, and service, 7*l.* per ton: total terminals, 18*l.* per ton. The latter company proposed "such reasonable sum as the company may think fit, not exceeding rates and charges in class 5." It will thus be seen that as between the original and present proposals a very considerable reduction has been made, especially as the present proposal includes all terminal charges. The Board of Trade will doubtless compel all the railway companies to adopt the present proposed maxima for smalls instead of leaving each company to decide as to what is fair and reasonable, thus giving the trader no voice in the matter. When, however, a comparison is made between the actual rates now paid by Mr. Farrance and the present proposed maxima, I quite agree that he will be at a great disadvantage, that is if the company choose to avail themselves of their full powers to charge their maxima. This is what the trade has hitherto failed to realise, and what my Association is endeavouring to obviate. Undoubtedly a vast increase in rates will be the result of the enquiry unless steps be taken to prevent it. When the labours of the enquiry are ended, and the railway companies commence to wield their newly-acquired powers (their pretensions to the contrary notwithstanding), I imagine that the ranks of your correspondents baying the same experience as Mr. Farrance, will be considerably enlarged. Their consolation of vainly beating the air will be very poor. I am grateful to Mr. Farrance for thus giving me the opportunity of emphasizing that which was universally expressed at the recent meeting.

Whilst on the subject of maximum rates, will you allow me the space to quote from the cross-examination of Mr. Findlay, general manager of the London and North-Western Railway Company, what his reasons were for fixing the maxima so high after the representations which were continually made to the effect that no company would ever enforce them?

Q. You told me the rates would be exactly the same, whether there was a maximum or not?

A. What I intended to convey, and I hope I made it clear, is this: that the rates under which the commerce and trade of the country are carried are fixed with regard to what the traffic will bear, having regard to the circumstances you mentioned, but in no case, having regard to the Parliamentary rates of the companies, must they exceed the maxima.

Q. But without consideration of the powers of the company, you make these maximum charges?

A. I should not object to that proposition.

Q. If maxima are fixed at an amount that no railway company would ever charge, that cannot be just or reasonable?

A. That must be in the discretion of the Court.

Q. We have to influence the discretion of the Court by facts, and we have to get facts to lay before the Court?

A. I adopt that suggestion.

Q. Therefore the maxima must be fixed at a position that will practically protect the traders?

sufficient for all purposes, and notwithstanding this, the original proposal of this company was to charge rates enormously in excess of such actual rates. F. C. Goodchild, Secretary, Nursery and Seed Trade Association, Limited.

ORCHID NOTES AND GLEANINGS.

LÆLIA CRAWSHAYANA AND L. GOULDIANA.

I HAVE read Mr. Crawshay's note at p. 78 with much interest, because he has the original *L. Crawshayana* in his possession, and therefore is in a position to compare the two plants. He was also kind enough to write me that his plant would be exhibited at the Drill Hall on January 14, where I might see it, and satisfy myself what the true plant really was. Unfortunately I was unable to be present at the meeting in question, but no doubt Mr. Crawshay will be able to spare a raceme just before the flowers wither, so that it may be preserved in the Kew Herbarium for future reference. This would prevent much confusion in future, and it is certain that spurious plants of both, exist in collections under these names. The danger is that when a flower is received under a given name, that not being already in the Herbarium, one may assume it to be correct, when all the time it may be erroneous. What came here as *L. Crawshayana* originally, is distinct from anything else that we have, but it agrees with Reichenbach's *L. C. leucoptera*, and I am quite satisfied it is a natural hybrid between *L. albidula* and *L. autumnalis*. But that author believed the true *L. Crawshayana* to be a hybrid between *L. anceps* and *L. autumnalis* (not *albidula*, because the flowers were larger). Now Messrs. F. Sander & Co. send *L. Crawshayana*, and Mr. J. Godsell kindly informs me that it is almost identical with the plant Mr. Crawshay exhibited. But this plant, which I had not seen before, seems to me a hybrid between *L. albidula* and *L. anceps*, in which opinion I am not alone. If this is right, I believe I am justified in calling the first-named *L. leucoptera*, and all who think that hybrids with different parentages should not be included under the same name, will surely agree. It does not seem likely, as Mr. Crawshay suggests, that *L. Crawshayana* and *L. albidula Stobartiana* "dropped from the same fruit," for either both would be natural hybrids or else forms of *L. albidula*; and the latter certainly is, but surely not the former. Nor can I agree that the origin of these forms is a matter of little interest. A new plant may be a new species, a new variety merely, or a natural hybrid. If the latter, it is surely interesting to know its parentage. It seems pretty clear that *L. albidula*, *L. anceps*, and *L. autumnalis*, are three quite distinct species, that they have been found growing together, and that they may occasionally hybridise together. From the latest evidence, I think *L. Crawshayana* comes from *L. albidula*, *anceps*, and *L. leucoptera* from *L. albidula* & *autumnalis*. Now the question is, does *L. Gouldiana* come from the one other possible combination—*L. autumnalis* & *anceps*, or is it only a variety of the former? More specimens have come to hand during the last few days, and it appears to exist in large numbers, which is against its hybrid origin, though I formerly tried to follow Reichenbach in considering it a possible hybrid. Perhaps after all, *L. autumnalis* is more variable than is commonly supposed; and if a large series of specimens were examined, would be found to include *L. furfuracea* and *L. Gouldiana*. R. J. Rolfe, Herbarium, Kew.

CYPRIPEDIUM VELOSUM.

Richard Blake, Esq., of Winterbourne, Dantsey, Salisbury, has been for many years an enthusiastic and successful cultivator of Orchids and other choice tropical plants, and the courteous and hospitable receptions extended to visitors wishing to see Mr. Blake's Orchid-houses, &c., are well known and appreciated by a large circle of amateur and profes-

FIG. 21.—VANDA TRICOLOR, VAR. PATRISONI. (SEE P. 133)

FIG. 22.—VANDA SUAVIS, WINGATE'S VARIETY. (SEE P. 133)

A. We have no limit, except our own discretion, so long as we do not exceed the maxima.

Q. If there is to be a maximum at all, it ought to be one fixed in a way that will be a protection to the trader?

A. Yes, Parliament has so decided, and I think it is a fair proposition.

Q. If maxima are fixed at an amount that no railway company would ever think of charging, they are no protection to the traders of the country?

A. Yes.

Q. Looking at your (actual) rates all round, I take it they are reasonable rates, and just to the railway company, enabling the railway company to pay a very good dividend?

A. We do manage to pay a dividend, but not very good.

Being further pressed, he admitted that the London and North-Western Railway stock was then quoted at 182. You will thus see that the actual rates are

sional gardeners who call on him, and whence they return in possession of some valuable hint regarding the successful culture of some particular species. Among the plants in flower in Mr. Blake's collection at the present time, the most notable is a fine healthy plant of *Cypripedium villosum*, which carries fifty of its orange-red and purplish-green flowers, of fine size and substance, and all are open together. It was shifted out of a 12-inch into a 15-inch pot four years ago, and is potted in peat and sphagnum. Late in the autumn the plant was put into the Cattleya-house, where it remained till the end of the year, when it threw up its flowers, and was soon afterwards taken to the cool-house, in which it is at present. The plant is about 3 feet in diameter. *H. W. W.*

DENDROBIUM SCHNEIDERIANUM ×.

This beautiful hybrid, between *D. Findlayanum* and *D. aureum*, raised in the collection of Oscar Schneider, Esq., Rusholme, Manchester, but distributed by Messrs. J. Veitch & Sons, is now again in flower in the Royal Exotic Nurseries, King's Road, Chelsea. It is a free grower and profuse bloomer; the flowers in size and form resembling those of a good *D. Ainsworthii*; the sepals and petals of pure white, and with a clear pink tinge on the outer halves; the lip is white, tipped with pink, and has rich orange marking at the base, which is also adorned with dark chocolate-coloured blotches. From the florists' point of view, it is a fine advance in *Dendrobis*. *D. splendidissimum grandiflorum* ×, also of Messrs. Veitch's raising, is in bloom, and is a long way ahead of others of its class. *J. O'B.*

EPIDENDRUM POLYBULBON.

This neat growing species, although an early introduction, is still rare in gardens. Some well flowered plants of it are now in bloom in Messrs. J. Veitch & Sons' nurseries. The plant is only a few inches in height, and the numerous small pseudo-bulbs bear comparatively large flowers. One form grown at Chelsea, had sepals and petals of a pale green colour, and lip of snowy whiteness; whilst others had the sepals and petals more or less marked with chestnut-red. *Sophranitis violacea* in bloom at Messrs. Veitch's, with numerous mauve flowers, forms an excellent companion to the *Epidendrum*. *J. O'B.*

ANGRECEM SESQUIPEDALE.

A very fine plant of this beautiful *Orchid* is now in flower (in the collection of W. C. Pickersgill, Esq., Blendon Hall, Bexley, Gr. M. F. Moore), carrying six magnificent flowers. *J. Carrill.*

LÆLIA MONOPHYLLA.

is a distinct and pretty species, bearing upon its slender stems linear-oblong leaves, which are solitary and dark green. It forms a creeping rhizome, and grows to a height of from 6 to 10 inches. The flowers are borne upon a slender peduncle, which issues from a small sheath situated on the top of the stem, the colour of the oblong sepals and petals being vivid orange-scarlet; lip minute, yellow, column tipped with purple on the anther-cap. It blooms during the months of August, September and October, and the plants continue in full beauty for several weeks.

This little plant requires somewhat different treatment to most *Lælias*. It is remarkable as being the only member of the family which has yet been found off the American mainland, as its native home is on trees which grow on the mountains in Jamaica, at elevations of from 3500 to 5000 feet above the sea-level, where the mean temperature is cool. With us it succeeds well in the *Odontoglossum*-house, hung up near the roof-glass, in order that it may obtain the benefit of the full light; but yet it requires to be shaded from the strong sun. We also find that shallow pans or baskets are the best to grow it in; these must be well drained, and very little potting material should be used about its roots, but good fibrous peat is the best material to use. This should be elevated into a cone-like mound, and the plant set upon the top; when so placed, the roots

can work inside or outside, and no water will lay about its crown. Having no bulbs, it requires a very moist atmosphere, and a moderate amount of water to its roots at all seasons. This plant is found growing somewhat low down on the stems of trees in its native mountains, and in this situation it is subject to rains all the year round, and heavy dews at night, the plants never becoming thoroughly dry. They are also shaded from the hottest sunshine, and obtain an abundance of fresh air, Nature providing for them in such a manner that their wants are all supplied; and in a state of cultivation we must endeavour to imitate as nearly as possible the conditions under which they grow in a state of Nature. The cultivator should ever keep a watchful eye upon this little gem, and if the plant does not appear to thrive in one position, or in one aspect, it should be removed to another, for frequently a change of aspect in the same house produces a wonderful effect, and leads to the achievement of success. The best time to re-basket this plant is immediately before growth commences, and in performing the operation the greatest care is necessary, in order to prevent injury to a single root. However, it will not require a fresh basket or fresh soil often, which is a great benefit, for this, like many other small-growing plants, cannot withstand disturbance at the roots.

DENDROBIUM TRANSPARENTS.

is a pretty and distinct, somewhat small-flowered plant, which is deciduous. It has upright stems a foot or more high, and the flowers appear in pairs or in threes for a considerable length up the well-ripened bulbs, in the same manner as those of *D. nobile*. The individual flowers are about an inch and a half across, and are somewhat transparent in texture, hence its specific name; in colour they are white, suffused with rosy lilac or pinkish lilac, with a deep blood-coloured blotch at the base of the lip. The blooming season is from the month of March until June, and sometimes it may be found in flower in July, the blooms continuing in full beauty for several weeks. This species is well adapted for growing in small Teak-wood baskets, or in shallow pans, so that they may be suspended near the roof-glass, fully exposed to the sun and light, shading only being necessary when the sun is very powerful, for they grow naturally upon rocks and trees, with a good exposure; and if, by judicious admission of air and an abundant supply of moisture, both to the roots and in the atmosphere, these conditions can be imitated, success will follow. The material we find to suit it best is good fibrous upland peat and sphagnum moss. As we have previously remarked, an abundant supply of moisture during the growing season is necessary, while during the resting season it may be kept dry; but the plant must not on any account be allowed to shrivel, just a sufficiency of moisture being given from time to time, to keep the slender, stem-like bulbs in a plump and fair condition. It is a plant which blooms after the resting season, and when it begins to show its flower-buds, the specimens will require a little moisture to their roots, to enable them to develop fine flowers, which also last longer in beauty if properly nourished. The East India House is the most suitable place to grow this plant, where it should be suspended near to the roof-glass, in such a position that it may be conveniently syringed on a warm day, as it dlights in moisture during active growth, and moisture from the syringe helps to keep away red-spider, which sometimes will attack these plants with slender membranous leaves. As there are a great many species which require similar treatment, they should all be grown together in one place; indeed, if a house can be devoted entirely to *Dendrobiums* during these growing and resting seasons, the results will be found well deserving of this isolation. "*Orchid Album*," November, 1889.

FRUITS UNDER GLASS.

THE PINERY.—Queen Pine-apples, if required for, say, the London season, must be selected from the possible fruiterers at once, choosing the strong, stocky plants, with thick broad leaves, and open centres.

These will respond to treatment in gentle warmth at top and root, a few inches of new tan or leaves being first added to the hot-beds. In a short time their fruits will soon show on stout, short stems, the certain forerunner of weighty fruit. Such robust plants will be able to assimilate manurial stimulants in abundance; and for this purpose I prefer Peruvian guano of good quality given liberally, in water at a temperature of not less than 80°. A bottom-heat of 80° to 90° will be suitable, but in one of 100° will be found dangerous, and extremes of any kind are apt to induce black cores, shrivelling of the stem, or other infirmity.

Increase the humidity of the house, but let the air get dry at times, and be changed once, at least, daily, or big crowns will form. The night temperature should range from 65° to 70°, and by day an advance of 10° or more with sun-heat will do good, but endeavour to avoid sun and fire acting together. It is a good plan to place the pots in position on the beds, but not fill up the plunging material until it has been seen that the bottom-heat will not be excessive. Crowding the plants together is injurious. Stout, stocky suckers put into 7 or 8-inch pots during last August, and shifted into 12-inch pots four to six weeks later, if skilfully handled up to the present time, will respond to the generous treatment above stated, but a few degrees lower temperature is advisable, or the plants may become drawn. Preparations should now be in progress for the general February potting; whilst such suckers that have become fit to be detached from the old stools may be potted into 7-inch pots, to be afterwards shifted into the fruiting pots at a later date. I have a great objection to potting a plant with a matted ball, and would prefer to reduce such a plant to the condition of a sucker. Before doing any potting, see that the soil about the roots is moistened throughout by careful watering two or three days previously. I prefer a good holding kind of turfy loam, cut thin, and stacked for six months before use, and if it contains sharp grit in plenty so much the better, and if it do not, sharp sand should be added as well as a few crushed bones and soot; sifted old mortar rubble may be used in lieu of the grit. The soil should be warmed, and be in a condition intermediate between wet and dry. Pot very firmly, and withhold water till the roots have begun to work into this new soil. *W. Cramp, Malvernfield Court, Malvern.*

THE HARDY FRUIT GARDEN.

CURRENTS.—Both red and white varieties should be spur-pruned, if numerous small bunches are desired, but the finest fruit is produced on young bushes when these have the shoots well thinned, so as to allow light to reach the interior of the bush, removing old branches no longer very fruitful, and spurring all the best placed shoots to two eyes, but leaving a few clean, straight, well-ripened and well-placed young shoots, where space will admit of this being done without crowding, as these not only help to maintain the bushes in vigour, but they produce the finest fruit. Black Currants are not improved by being spur-pruned, and no form of growing them that I have tried succeeds so well as the bush, although standards and other methods of training bushes have been tried. These look well in a garden for variety's sake, but quality and quantity of fruit are lacking. A good variety should be grown, although it is often found that of the same variety there may be picked out two or three bushes on a quarter much superior to the others, and from those only should cuttings be taken. A light forking over of the ground between the bushes should be given, but deep digging ought to be avoided, unless the bushes stand at wide distances apart, when no harm would follow deep digging in the middle spaces.

Filberts and Cobs.—Wherever these are liked, no pains should be spared to get them as fine and large as the soil and district will admit of. The bushes should be kept hollow—that is, basin-shaped. The shoots at the circumference kept about 1½ feet apart, and all suckers should be rigorously extirpated, and this should not be left entirely till the winter, but they should be drawn up in summer as well. Do not prune any bushes before the female flowers become visible, or the work will be of a very haphazard kind. The pruning most suitable for *Filberts* is a slightly modified kind of Currant pruning, spurring in side-shoots, and shortening back the female (*Nut-bearing*) ones, by merely cutting back the upright points, and not always doing that, remembering that a crop of Nuts is of more value than any system, however

good. Nuts form a profitable crop where the situation is warm and sheltered, and the soil good without being rich. The purple-leafed variety, so telling a plant in the shrubbery, will bear fine Nuts under ordinary good management. A. Evans, *Lytle Hill, Haslemere*.

PLANTS AND THEIR CULTURE.

THE FERNEY.—During the next week or so is a suitable time to work at the plants in the fernery, and other houses containing Ferns; repotting and top-dressing all that require these operations. If the materials are ready for the work, it is well to commence thus early, so as to give the plants ample time to form perfect fronds. *Adiantum cucumatum*, if required for cutting purposes, should be grown in large batches, of which the earliest will now have begun to grow, and these should get a shift, dividing them into several pieces if large, should additional plants be necessary. We grow our latest *Adiantums* for cutting very cool, and giving just enough warmth to keep them in health. A lateinery is a suitable place for them through the summer months. *Davallias* need nearly the same kind of treatment when grown for cutting fronds, they being divided and repotted, and their creeping rhizomes pegged down. The watering should be done with care till new roots are made.

Gymnogrammas, and Ferns of similar growth, should be repotted, care being taken not to over-pot them. The drainage should be made of clean cracks, and only peat and coarse silver-sand should be employed. Pot firmly, and place the newly-potted stuff at the warmer part of the house, taking care to keep them dry overhead. Small plants of *Gymnogrammas*, spore-raised and others, will soon make useful plants if grown on in a warm house. Where there is a large demand for these species of Fern, and there exists a difficulty in keeping up the supply of them, plants from spores should be looked after, and assiduously grown on. *Adiantum Farleyense* needs much the same treatment as the *Gymnogrammas*, that is, placing it at the warmer part of the house, and out of the reach of the syringe. Young plants should have roomy pots, and a compost consisting of materials of a heavier nature than those advised for the other species of Ferns, and fibrous yellow loam with plenty of coarse sand may be mixed in it.

Gleichenias.—These plants should be examined and repotted, and the rhizomes pegged down. Shallow pots or pans are best, and the drainage should be plentiful. These and other Ferns which may be infested with brown scale should be cleaned before they are repotted, and have the old fronds removed. Tobacco-water made rather strong, with a little soft-soap added, should be used for plants that are badly infested, and sponging should be resorted to in these cases, as it is of the greatest importance that a start should be made early in the season with clean fronds, or the young growths will soon also be overrun.

Pteris serrulata and *P. cretica* are good for cutting, and although both are very subject to scale, they grow so readily, that dirty plants should not be harboured, but thrown away.

Basket Ferns may be taken in hand, and new material added if large fronds are desired. Before turning these plants out of their baskets, thoroughly soak the soil. Many free-growing Ferns will last in good condition for a longer period if loam be used in the new compost, and old mortar rubble in small quantities is of benefit if the loam be heavy, and in that case less sand is desirable. A sufficient quantity of Selaginellas, in variety, should be secured, and especially of the hardier *S. denticulata* and *S. Martensii*. Edgings of Ferneries, if made of Selaginellas, may now be replanted, taking care that the soil employed for them is loamy and rich. Tree Ferns, if found to be too dry at the roots, must be thoroughly saturated, and then any repotting that is required may be done, the house being kept rather closer afterwards, and the watering carefully performed. G. Wyles, *Syon House, Brentford*.

THE KITCHEN GARDEN.

THE TREATMENT OF CABBAGES.—Where a deficiency is likely to occur in Cabbages planted in the autumn, a sowing of seed should at once be made in pans or boxes in a mild warmth, and the seedlings duly hardened off, and planted out when the weather is suit-

able. Sow the seed thinly in sandy loamy soil, not made rich, but pressed moderately firm; cover the seeds either very slightly or not at all. The pans may be stood in ainery or Peach-house newly started, until the plants appear above the soil and have a pair of true leaves, when transference to another pit or house where there is plenty of air is advisable. If left in a moist heat or far from the glass anywhere, the plants damp off or become drawn. Watering at all times during the early stages should be done cautiously. Ella's Early Enfield and Stuart & Meis's No. 1. are very trustworthy varieties that succeed each other in coming into use. A pinch of seed of the red variety may also be sown if there are no autumn-sown plants, otherwise the Cabbage will not form a good heart. Make good all gaps in beds that were autumn planted, making the soil firm about the plants, and keep slugs in check by constantly dusting the soil about the plants with soot and lime, or wood ashes in a dry state; and even the troublesome method of hand-picking has sometimes to be resorted to.

Cauliflowers.—Make a sowing of these, for coming into use in June and July. Early Erfurt, Dean's Snowball, Early London and Walcheren, I find to be excellent varieties for summer, these varieties form a good succession. Sow thinly in pans of light sandy soil, place them like the Cabbage in a warm place and near the light, and when large enough to handle, prick them off into cutting-boxes or pans, or what is much better, a frame with a mild bottom-heat. The Erfurt type may be pricked off into small pots, putting three into each pot, and being more dwarf than any other they may with advantage be closely planted in the open when the time arrives to do so. Keep the plants always growing, great care being necessary to prevent any check, or buttoning will ensue.

Lettuces. If Lettuces are required at an early date, a sowing of some approved variety may be made in gentle heat and in pans, pricking out the seedlings in frames, and transplanting them on to a sunny border in April. Another way is to sow the seeds at once in a frame placed in a sheltered corner facing the south, keeping the frame close until germination has taken place, when air must be given, moderately at first, and afterwards abundantly. Cover the seed but slightly, and press the soil to a moderate degree of firmness.

Mushroom Beds. Those beds in bearing should be carefully examined, and if dry be then moistened with tepid water, and the temperature of the structure kept at about 55°. Mushroom ridges should also be examined, and if the covering is decaying, fresh, sweet litter must be put in its place. Put on more covering if the plunging thermometer indicates a fall below 80°. If the horse-droppings for mushroom beds are collected daily, spread them thinly on the ground in an open shed till enough has been got together to make a bed, when, if the rank steam and heat have been thrown off, a long heap may be made, and when fermentation recommences, it should be turned over once and again some few days after. In making up the materials, if in the mushroom house proper, the beds may be 15-inch thick at the back and 12 inches at the front, beating the materials very firmly as they are placed in position. Beds in sheds not properly heated should be not less than 2 feet thick at the back and 1 foot 8 inches at the front, if made with one slope. If made as a ridge, a 3 feet base and 2 feet in height will do. A bed when it has a temperature of 80°, is fit for spawning, and after the spawn is inserted in egg-sized pieces, just under the surface and one foot apart, a couple of inches of sifted loam, moderately heavy, should be laid on the bed and beaten smoothly. Cover the beds with dry litter. H. Mackham, *Mercworth Castle, Maidstone*.

THE ORCHID HOUSES.

EAST INDIAN HOUSE.—Any forward plants of Cattleya Warneri which may be standing in the Cattleya-house, which is too cold and dry for the plants to make vigorous growth, may be brought into the East Indian-house. The same shifting of the positions will apply to any plants of Cattleya Sanderiana or C. gigas and its varieties, but very little water may be afforded the latter species until the plants begin to show their flower-sheaths, or the plants may make large growths only, the plants being then almost sure to break away at once, and premature growth ensue. Temperature, 65° by night, 70° to 75° by day.

THE CATTLEYA-HOUSE.—Several species of the plants in this house may now be taken in hand as opportunity offers, such as *Laelia Perrinii*, *L. elegans* (Warneri), and *L. alba*. If the plants are taken out of their pots, great care must be used in watering afterwards, and it would be much better if no water whatever be given them, unless the pseudo-bulbs show some signs of being too dry, as shrivelling, &c., until it is seen that the roots are becoming active. The potting materials should always be used in a rather moist state, as this obviates in a great measure the need to afford water.

Cymbidium giganteum Mastersii, and any of its varieties that may require it, should now be repotted, the time having approached when growth recommences. They do well in a compost of one half turfy loam and peat, and a few lumps of sphagnum moss, the latter being placed at the top, thus adding to the appearance of the work, and affording a sure test when the plants require watering. *Cypripedium Sedeni* and its varieties, which are now gone out of flower, should be attended to soon; and in repotting these it should be remembered that they are very fast growers, and will take larger shifts than many other Orchids. *Cattleya dolosa* and *C. Walkeriana* are very useful winter-flowering plants, which may be had in flower at Christmas time, and will remain fresh until this date; but care must be taken not to give them too much water at the root if they remain in this house. The same species of Cattleya which suffer most when kept too dry are *C. bicolor*, *C. velutina*, *C. guttata*, *C. Lodigiesii*, *C. Harrisonii*, and *C. amethystoglossa*, which shrivel quickly if left without water for a week or two together. Give air freely during mild weather; but when cold biting winds blow, the top ventilators should be kept closed, the bottom ones over the hot-water pipes being the only ones used. Temperature, 60° by night, 65° by day, with a rise of 5° with sun-heat.

Vanillas. *Vanla tricolor*, *V. snavis*, *V. insigne*, and *V. Kimballiana*, should now receive attention; and plants which may have lost bottom leaves, and have roots high up the stems, should be cut down. And in fixing them in the new pots the roots should be very carefully placed in the pot first, and the pot-sherds carefully placed in afterwards, together with a layer of sphagnum moss on the top, and this should have a little silver sand mixed with it, and be made as firm as possible; very little water will be needed for some time to come.

Vanla Sambucina. Plants which have been resting since the end of the month of September should be repotted if this be found necessary, otherwise the plants may be surfaced with fresh sphagnum moss and placed in the warmest part of the house. The plants enjoy plenty of heat and moisture, and a Pine-stove in which the temperature does not descend below 70° is a suitable place for them. In this heat stout sturdy foliage like that with which they were imported will be formed. Where the plants have long stems, they should be syringed twice a day to induce strong new roots to break. I keep them in this house until nearly ready to flower, that is, in August and September.

Cattleya Schilleriana, which is now breaking away, should be carefully looked after to see that it is not allowed to become dry. This plant grows well on teak blocks, the bottoms of which are placed in pans, and broken pot-sherds are put around the roots, but very little sphagnum moss or peat, as the plants, when growing, require more water than any other Cattleya. Our plants, when growing, are dipped once every day and syringed overhead twice; and we get from five to seven flowers on a growth by this treatment. They should be hung up close to the glass, and require very little shade.

Cool House.—Plants of *Odontoglossum Alexandrae*, *O. triumphans*, *O. Psecterianii*, &c., which have been repotted lately should have very little water for a month afterwards. Strong plants which may be pushing up good spikes should have a wire placed round the pot, and be hung up to the roof, thus giving a better chance of escaping their foes, the slugs, and the effect is also good from a decorative point of view. *Oncidium Marshallianum*, now showing its spikes, must be very sharply watched, as slugs find the spikes delicious morsels. All walls, stages, and floors should be thoroughly syringed and kept moist, and the plants very lightly dewed over in the morning, but this damping should not be done afterwards. The temperature may still continue at 45° by night, and should not exceed 50° by day with fire heat. A. G. Catt, *Dorkfield, Worcester*.

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communication should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, and sent as early in the week as possible.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

THURSDAY, FEB. 6.—Linnean Society.

SALES.

MONDAY, FEB. 5. Lilies and other Bulbs, at Protheroe & Morris' Rooms.

TUESDAY, FEB. 4. Orchids in Flower, at Protheroe & Morris' Rooms.

WEDNESDAY, FEB. 5. Roses, Fruit Trees, Rhododendrons, Border Plants, and Bulbs, at Stevens' Rooms.

THURSDAY, FEB. 6. Linnæarum, Greenhouse Plants, &c., at Protheroe & Morris' Rooms.

THURSDAY, FEB. 6. 40,000 Lilies in variety from Japan, 50,000 Tuberoses, &c., at Stevens' Rooms.

FRIDAY, FEB. 7. Nursery Stock from Sample, at Protheroe & Morris' Rooms.

FRIDAY, FEB. 7. Imported and Established Orchids, at Protheroe & Morris' Rooms.

SATURDAY, FEB. 8. Roses, Fruit Trees, Rhododendrons, Border Plants, and Bulbs, at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—39.2.

The Fruiterers' Company and Fruit Culture.

In answer to the appeal for funds to be devoted to the furtherance of fruit culture in cottage gardens and homesteads, which it will be remembered was made last autumn by the then Lord Mayor, Sir J. WHITEHEAD, Bt., a sum of £1600 has been subscribed. This is what Sir JAMES, as the Master of the Fruiterers' Company, announced at a banquet of the company held last week.

Ever since the subscription list was opened by £500 from the Fruiterers' Company, there have been questionings by those who have the matter of fruit culture most at heart. It has been repeatedly asked what the company proposed to do with the funds placed at its disposal, and not a few feared that the money might be spent in useless, although well-intentioned directions.

From what the Master of the Fruiterers' Company stated at the dinner referred to, when proposing the "Health of the Royal Agricultural Society," we gather that the money is to be expended in following in the wake of that prosperous society, and practically allowing that body to be the disbursers of the £1600 in hand.

Now the Royal Agricultural Society, although a society of high standing and merit, does not appear to us to be the best adapted body for the promotion of the objects held in view by the Fruiterers' Company, and cannot for a moment be compared, as far as fruit culture is concerned, with the Royal Horticultural Society, which has in its fruit garden at Chiswick, and its highly successful Fruit Conferences of 1883, 1885, and 1888, given more real impetus to the question

of fruit growing than its sister institution. Indeed, the outcry for extended fruit cultivation may be traced to the first of those great Conferences—that of 1883, which was reported on in the volume *British Apples* by Mr. BARNON, in which work the best varieties, according to the votes of those most able to pronounce opinions—the practical fruit-growers of the whole kingdom—were brought strikingly before notice. All this valuable information was refuted and brought up to date in the report on the National Apple and Pear Conference of 1888; and now, when so much of the work has been done by the Royal Horticultural Society, the Fruiterers' Company ignores all this, and has decided to throw its weight in with the Royal Agricultural Society.

The last-named society has on a previous occasion endeavoured to show a lead in fruit culture, but the attempt was a failure, as it must always be when the Royal Agricultural Society holds its great show at a time of year when there is no fruit to be had.

But, putting on one side that view of the matter; is not the range of subjects already embraced by the Royal Agricultural Society quite extended enough? Even supposing that the subject of fruit culture could be well introduced into its circle, would not the matter be allowed to drop into or even be forced into, comparative insignificance, against the other far-reaching branches of agriculture? Certainly the work falls more within the line of operation of the Royal Horticultural Society, but the "flower-show taint" still hangs over it, and people look on horticulture as a pleasant amusement with no more serious purpose; and the Society, with all its hard work and useful public service, has not obtained the public recognition it so thoroughly merits. In this, as in so many other cases, the noisy ones manage to gain the ear of the public, while those who know the most and do the most are overlooked. We look to the representative societies to provide a remedy for this, and to secure a hearing for the right men; but if the societies themselves are not allowed to "represent," the field becomes left open to windbags and axe-grinders.

The Master of the Company also spoke earnestly of a hope that the teaching of agriculture, chemistry, and other sciences bearing on the subject of the land should be made compulsory subjects in the schedule of all schools aided by the public rates and the State—at all events, those in country and rural districts; and that there would be great advantages following on such a course is not open to much question. Land is the basis of all wealth, and whatever tends to the better utilisation of the land must assuredly result in a benefit to the community at large. This suggestion was also contained in the Bill introduced into Parliament last year by Sir WM. HART-DYKE, but which had eventually to be withdrawn.

The earnest desire of the Fruiterers' Company to do all that lies in their power to improve the present state of fruit cultivation in this country is one deserving of great sympathy and support, and it is to be hoped that the Company will take greater care in selecting its advisers, so that its energy may be better directed.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The following persons were put on the list of pensioners without election, in accordance with the rules, on the occasion of the meeting on the 16th inst.:—Emily Friend, Mark Hebblethwaite, Eden Georgina Murray, John Skene, John Trotter, and John Wainwright.

LINNEAN SOCIETY.—At the meeting of this Society on the 16th ult., Mr. J. G. Baker, F.R.S., Vice-President, in the chair, Mr. S. Lithgow was elected, and the following were admitted Fellows of the Society:—Messrs. C. W. Turner, J. T. Tristram Valentine, William Rome, and Major A. R. Dorward. Mr. Clement Reid exhibited, and made some remarks upon, a collection of fruit of *Trapa natans* from the Cromer Forest bed at Mundesley. Mr. J. G. Baker exhibited and described a collection of Cryptogamic plants from New Guinea, upon which Mr. A. W. Bennett and Captain Elwes made some critical remarks. In the absence of the author, Mr. A. Barclay, a paper was read by Mr. B. D. Jackson on the "Life History of a remarkable Uredine on *Jasminum grandiflora*." A discussion followed, in which Mr. A. W. Bennett and Professor Marshall Ward took part. This was followed by a paper from Mr. Edward E. Prince, "On certain Protective Provisions in some Larval British Teleostans."

—At an evening meeting, to be held on February 6, 1890, at 8 P.M., it is intended to read the following papers:—I. "On the Stamens and Setae of *Scirpus*," by Mr. C. B. CLARKE, F.R.S., F.L.S.; II. "On the Flora of Patagonia," by J. BAILL, F.R.S., F.L.S. Exhibitions:—1. Certain Seaweed covered Crabs, by Professor STEWART; 2. Pitchers of *Nepenthes Mastersiana*, by Professor STEWART.

VEITCH MEMORIAL FUND.—At a meeting of the trustees of the above fund, held on the 23rd ult.—present Dr. ROBERT HOGG (in the chair), and Messrs. T. B. HAYWOOD, G. F. WILSON, and H. J. VEITCH—it was decided to give four prizes, consisting of four Bronze Medals and four sums of £5 each, on the occasion of the Chrysanthemum Centenary, which opens on November 11; and also a special Silver Medal to Mr. BRUCE FINDLAY, of Manchester, and to Mr. DAVID THOMSON, of Drumlanrig, in recognition of their valuable services to British horticulture.

NATIONAL CHRYSANTHEMUM SOCIETY.—A meeting of the general committee of the above, followed by the annual general meeting, took place at Anderson's Hotel, Fleet Street, E.C., on the 27th ult., the former at 7 P.M., and the latter at 8 P.M. The business of the committee was of a formal character, the Secretary announcing that the sum of £45 5s. was awarded in prizes at the recent mid-winter show. At the meeting of members, which was numerously attended, Mr. E. SANDERSON, one of the Vice-Presidents, in the chair, after some formal business, the Hon. Secretary, Mr. W. HOLMES, read the report and balance-sheet; the former alluded to the great success which had attended the Society's operations during the year; to the revision of the rules, which had worked well; to the election of Lord Brooke, M.P., as President; the Hull provincial show, which had proved highly successful; the Conference at Hull; the preparation and issue in the autumn of an eight page supplement to the Society's Chrysanthemum catalogue; and in reference to the Centenary exhibition and meeting to be held in the Royal Aquarium in November next, the committee had recommended and provided for the publication of a new edition of the catalogue. All the shows held, had well maintained the credit of the Society; and the Conference held in connection with the mid-winter show on January 8 proved of a highly interesting and instructive character. The annual dinner, held under the presidency of Lord Brooke, was a great success. The Floral Committee had held several meetings, the average number of Certificates of Merit had been awarded, and the committee had made their awards with due care and attention. The Centenary of the introduction of the Chrysanthemum into England would be celebrated on November 11, 12, 13, and 14; and a sub-committee appointed to consider how best to celebrate the event, had made some valuable recommendations. An early issue of the programme of arrangements would take place. The report concluded with a

THE TERRACE GARDEN, RICHMOND.

reference to the recent International Centenary Exhibition of Ghent, and alluded with satisfaction to the presence of a delegate from the Society, and the awarding of the Gold Medal of the Société de Agriculture et Horticulture de Gand. The balance-sheet showed an income from all sources of £871 10s. 8d., including £226 10s. 3d. annual subscriptions, £109 14s. donations, special prizes, &c., and £217 2s. received from the Royal Aquarium Company, and a further sum of £89 18s. from affiliated societies. The credit side showed the same amount, including £426 12s. awarded as prizes, and £39 10s. 6d. for medals, &c., a balance of £19 0s. 9d. being carried forward. The profit on the sale of catalogues during the past year had amounted to £18; the reserve fund amounts to £101 18s. The contributions to the special prize fund at the Centenary Show in November amounted to £150 10s., and the trustees of the Veitch Memorial Fund have allotted four medals and the sum of £20 in prizes at this exhibition. The report and balance sheet were adopted, and a hearty vote of thanks was given to the auditors. Lord Brooke, M.P., was re-elected President by acclamation; Mr. J. Stirling, as Hon. Treasurer; Mr. R. Ballantine, as Chairman; and Mr. E. C. Jukes as vice-Chairman of the Committee; Mr. W. Holmes, as Hon. Secretary and Superintendent of the exhibition a most cordial reception being given to Mr. Holmes on his rising to return thanks; and Mr. C. Harman Payne as Foreign Corresponding Secretary. Messrs. Crane and K. Cannell were elected auditors, and the following, forming one-third of the committee, were elected on that body for a period of three years: Messrs. Boyce, Wright, Gordon, Stevens, H. J. Jones, B. Wyne, R. Dean, Gibson, E. Sanderson, Mandlin, J. H. Laing, D. B. Crane, and Bruce Ironside. The Sevenoaks Chrysanthemum Society, and the Taunton Chrysanthemum Society, were admitted to affiliation, and three new members were elected. It was unanimously resolved that the sum of £10 be devoted to the purchase of a present for Miss Holmes, in consideration of the great assistance rendered in relation to the clerical work of the Society; and the committee were empowered to provide clerical assistance for the Hon. Secretary consequent upon the growth of the Society. The proceedings closed with a hearty vote of thanks to the Chairman for presiding.

THE ROYAL HORTICULTURAL SOCIETY OF PERTHSHIRE.—The first meeting of the third session of the literary branch of this Society was held in the hall of the Perthshire Society of Natural Science on Friday, the 24th ult., and was well attended. Mr. A. McKINNON, Seone Palace Gardens, being in the chair. The preliminary business having been transacted, the Chairman read a paper on "Fruit Farming for Profit." Mr. McKINNON examined the subject in all its bearings, and came to the conclusion that soft fruits, hardly affected by foreign competition, could, to a moderate extent, and, under favourable circumstances, be grown profitably; but to lay out Apple and Pear tree orchards would prove most precarious and unprofitable. An animated and interesting discussion followed the reading of the paper.

THE FRUITERERS' COMPANY. The annual dinner of this City Company was held at the Albion Hotel, Aldersgate Street, on Monday evening last, Sir James Whitehead, the Master, in the chair, and was supported by the Lord Mayor, Sir Henry Isaacs; the City Sheriffs, Major Craigie, and others. Horticulturists were represented by Messrs. A. F. Barron, T. F. Rivers, and J. Wright, who, it may be safely said, did not give their adherence to all that was heard on fruit culture. A copy of Mr. Wright's essay, bound in morocco, and containing a beautifully illuminated frontispiece, was presented to the Master by Mr. H. R. Williams.

EUCALYPTUS AND INFLUENZA.—A Parisian correspondent of a London daily, describes her experience of an attack of bronchitis which followed a

mild dose of influenza. In spite of a hypodermic injection of morphia, and usual remedies, the pain did not abate. The writer goes on to say:—I happened to have a bottle of Eucalyptia from BURGOGNES & WELLCOME, and in despair I swallowed a large dose. In an hour there was decided improvement, and in two days I was out of bed. I continued the Eucalyptia until the cough had entirely disappeared, and with two members of my family it was used with the greatest success. If the theory about influenza being a germ disease be a correct one, there is no doubt but that Eucalyptia is one of the most potent remedies. In all miasmatic countries, in all countries infested by malaria, and subject to chills and fevers, no more valuable tree is found than Eucalyptus globulus. If a house in a malarious district is surrounded by a thick growth of these trees, it is possible for the family to escape chills and fevers, when another family a quarter of a mile away are shaking their lives out. The pungent, penetrating smell is death to microbes, and the medicine manufactured from the oil is an excellent tonic and blood purifier.

MUCUS DISEASE OF HYACINTHS. By A. HEINZ: *Contr. f. Botanik u. Parasitenk.*, v. 1889, pp. 355—391. —Hyacinths are affected by a wasting disease, attended with the production of a foul-smelling mucus. The flowering parts are specially attacked, but no part is exempt. Microscopical examination showed that the mucus and the tissues were full of a bacterium, which is a mobile rod, invariably single, with rounded ends, 1—5 μ long and about 1 μ thick. They propagate by direct fission, and stain well with all the usual dyes. The bacillus was easily cultivated pure on gelatine, agar and Potato, and healthy plants inoculated from these cultivations showed evidences of disease, most marked about the inoculation spot, in 24 hours. Hence the author concludes that this microbe is the actual cause of the disorder, and the name given to it is *Bacillus Hyacinthi septicus*. It does not liquefy gelatine. Superficial colonies on plates are circular, about two mm. in diameter, bluish-white in colour, with a somewhat darker centre. Those lying deeper are oval, and of a dull yellowish-white. The cultivation differences on gelatine and agar are not noteworthy. On Potato there forms in thirty-six hours a yellow slimy layer, and in a few days the cultivations give off a strongly offensive smell. Other authors, notably Sorauer and Wakker, have described wasting diseases of Hyacinths, attended with the production of mucus. These also were caused by bacteria, but Dr. Heinz considers that the disease observed by him is distinct from the yellow and white mucus degeneration of Wakker and Sorauer. *Ab. Jour. Bot. Soc. Belg.*, 1889, p. 572.

NUT BLOOMS.—The mildness of the present month of January, says Mr. WELLS, of Harpenden, has caused both Filberts and Hazel Nuts to bloom unusually early in this neighbourhood. So abundant are the tiny red female blossoms, that many of the trees show quite a pinkish hue. Having taken phenological observations at Harpenden during the past twelve years, that is since 1878, I find the Hazel Nut usually is first found in flower about the second week in February. The soil of this district is of a decidedly cold description. The earliest records of Hazel blooms I have observed are as follows: 1882, January 30; 1884, January 23; 1888, January 27; 1890, January 11. We see, therefore, that the date of the present season's flowering corresponds with the earliest date cited in Roemer's *Naturalist's Diary*, as quoted in last week's issue.

ORNAMENTAL PODS AND BERRIES.—A collection of seeds of plants bearing ornamental fruits, for winter-decoration, have been sent to us by Messrs. WATKINS & SIMPSON, Exeter Street, Strand, W.C. All are species well known in gardens, as *Physalis Alkekengi*, *Iris foetida*, *Lunaria biennis*, *Honesty* of old-fashioned gardens; *Eryngium amethystinum* and *Dipsacus Fullonium*. Two very undesirable

species are included, without any warning being placed on the packets to the effect that the plants are very poisonous to human beings: these are Henbane and Thorn-apple.

THE COLTSFOOT.—We saw plenty of this in flower on January 25, on a railway-bank near London, and it had in all probability been in flower for one or two days previously. The earliest previous record that we can find is on February 3.

GRAFTING CUCUMBERS.—We learn from the *American Agriculturist* that there are some ways in which the grafting of annuals and other herbaceous plants can be made available for special purposes. Cucumbers, for example, may be grown on a high trellis, or around the upper story windows of any building, by training either *Sicyos angulatus* (the single-seeded star Cucumber vine), or the *Echinocystis* (Wild Balsam Apple)—either of which will grow to the desired height. Cucumber seed may then be sown in a flower pot, and when the plant is 6 or 8 inches high it may be joined to one of these wild vines at the desired height. Merely scraping the bark of the two plants and tying them firmly together with any soft material is sufficient. They will unite in about ten or twelve days, or sooner, and produce fruits at a height to which the garden Cucumber could never attain.

THE EXHIBITION OF THE ROYAL HOUSE OF TUDOR.—This is a most interesting exhibition at the New Gallery of portraits, costumes, arms, and other objects connected with Tudor times. It is almost impossible to exaggerate the interest of this great historical object lesson. Those interested in studying the history of our garden flowers will find plenty of material for their purpose. Glancing at a few of the portraits at random, we find one of John More, the father of a more celebrated son, the Lord Chancellor More. In his left hand he holds an Apple. What is the significance of that Apple? Margaret P...net, whose head fell on the scaffold in 1541, holds a bunch of Honeysuckle; a portrait of a man by Holbein shows a single Clove Pink—indeed, the popularity at that time of the Gilliflower, is attested in this exhibition in several other cases. Ann of Cleves (1534) has a Clove Pink in her hand; Ann, Lady Petre, has a Pink with fringed edge to its petals, thrust into a curious little box or bouquet-holder John Winchcombe (1559), the son of Jack of Newbury, is also represented, in two different portraits, with a Pink in his hand. Charles Brandon, Duke of Suffolk holds a posy in which is a Clove Pink and wild Pansy—wild at least to the notions of a modern Pansy fancier. Most of the Pinks are selfs, but one of the portraits we have unfortunately omitted to note, which shows what we now call a Carnation but which Perria at that time of day called a "streaked Gilliflower," and, in allusion probably to the piobald appearance, adds, "which some call Nature's bastards." Roses, of course, are often shown. Queen Elizabeth, in one of her many portraits, bears a true York and Lancaster Rose, not the striped one which generally goes by that name. Another portrait of the dressy Queen shows her with a single red Tulip, erroneously called a Lily in the catalogue, attached to each shoulder, and a similar flower in her left hand. But the objects of interest in the exhibition are beyond computation.

INDOOR FLORAL DECORATIONS. The Birmingham Council House, says a correspondent, lends itself readily to the art of the floral decorator. At the Mayor's Ball recently, Messrs. Howitt & Co., nurserymen, were entrusted with the extensive floral arrangements, and in conjunction with the firm of LUMERY, the general decorations were admitted to be the handsomest seen in the Midlands. The reception-room was fitted up in Eastern style, and a lovely group of Orchids and Adiantum Farleyense at the base of a large mirror was much admired, and in the same apartment were groups of Calathea

Veitchii and Maidenhair Ferns. In the ball-room one fire-place was filled in with Euphorbia jacquiniiflora in a sloping position, and was a telling feature; the mantle-piece and niches with Maidenhair Ferns, a small Palm at each end, and sprays of Asparagus. Another mantle-piece was filled with Lily of the Valley, with a handsome Palm at each end, fringed with variegated Ivy-leaf Pelargonium Duchess of Edinburgh, and the fire-place with a graceful Palm, two bright crowns, and a carpet of yellow Tulips and Maidenhair Ferns, a large bank of Palms, with a central monster, *Phormium tenax* variegata, with a *Cocos Romanzoffiana*, quite 15 feet high, towering behind it, in which were masses of Arum Lilies, *Poinsettia pulcherrima*, *Spiraea japonica*, with a carpet of Tulips and Italian Hyacinths set in Ferns, was greatly admired. One good-sized room was fitted up as an ice cavern, in which several tons of ice were used, and with mirrors and the electric light, was indeed a beautiful object.

SPANISH PLANTS.—The last issued part of Prof. WILKOMM's excellent *Illustrationes Florae Hispanie insularumque Balearicum* contains figures and descriptions of various Composites and Dipsacace, &c. Some of the *Armerias* as *Allioides* of Boissier, a white flowered species, would be desirable introductions to gardeners; so also would *Statice insignis* with red flowers. The text is in Latin, French and Spanish.

"JOHN ROGERS."—We ought to have called the attention of our readers to this little book before, but it is not too late now to recommend it to their perusal. It is published at Southampton by Mr. H. M. GILBERT, and consists of an autobiography of one who was proud to call himself a gardener. It was written when the author was, though in his eighty-seventh year—in the full possession of health and faculties, able to walk several miles a day, to write books, and read without spectacles. He died in November, 1842, in his ninety-first year, having lived during the reign of five English sovereigns, from George II. downwards. Mr. ROGERS was the grandfather of the present proprietor of the Red Lodge Nursery at Southampton, and in the present pages which have been reprinted, gives sundry details of the eventful period in which he lived. Amongst other things he was an eyewitness of the Gordon Riots. He records a visit he paid to PHILIP MILLER at Chelsea, and which seems to have afforded great pleasure to the incipient gardener. Airos the elder was another celebrity by whom he was employed in the Royal Gardens at Richmond. Here, on one occasion, he saw the King, who was unable to gain admission in any other way, throw up one of the windows of the palace, and enter the house head foremost. Various sayings of the King are recorded as within the author's knowledge. A fine house was built on Richmond Hill, when the King, on being told that it was being erected by his Majesty's card maker, replied, "Eh, eh! Well, well! His cards must have proved all trumps." ROGERS did what few young gardeners do nowadays—made a collection of dried plants, which enabled him to learn the names and to become acquainted with the habit and culture of every plant that came under his notice. We need not follow the author through his various situations, but may add that eventually he settled down in the nursery of MATTHEW BIRCHALL, of Fulham, the father of the eminent botanist and traveller. The nursery is spoken of as one of the oldest and best conducted nurseries of the period, and contained one of the largest and choicest collections in the country. This was the establishment which subsequently passed into the possession of Messrs. WHITLY, BRADY & MUSE, and at a later date was that of Messrs. OSBORN & SONS. There are fewer than fifty pages in the book, but there is not one of them which will not prove interesting to a gardener desirous of knowing how things were done in the olden time.

PUBLICATIONS RECEIVED.—*On London Eggs*, by ALFRED CAMPBELL, M.D. (Croydon: ROLEY & CLARKE, High Street.)

A GARDENERS' PROBLEM.

CERTAINLY horticulturists and gardeners must be thankful to a man in the position of Mr. Thistleton Dyer for his keen and truthful elucidation of a

another one who has no notion at all of the above sciences. If he has a good knowledge of plant geography, he will not care much for detail, and will adopt appropriate treatment for at least the majority of plants new to cultivation confided to his care.

FIG. 23.—PLAN OF GENERAL ARRANGEMENT IN THE EXHIBITION PALACE, BERLIN.

matter so likely to raise discussion. Like Messrs. Elwes and Burbidge, I also venture to enter the arena, my excuse being an experience of over forty years. Though the gardener's art be essentially empirical, yet I am of opinion that a gardener having a knowledge of plant-geography and of the climatology of the various countries of the globe is more likely to be successful in his empirical work than

Most of the subtropical plants do not grow in peat but in loam, sometimes of a clayish or stony hard nature, yet they readily adapt themselves under cultivation to peat and to a very different treatment than what Nature affords to them.

It is an undeniable truth that "the constitution of certain individual species is inelastic," but it is for this category of plants that the cultivator

requires the most exact indications of the conditions under which they spontaneously live; sometimes they are restricted by certain ingredients of the soil, sometimes by local positions and influences. No doubt about it, a skilled gardener would eventually find out by empirical research, what were their wants, provided he did not kill them during the experiment. His endeavours would be crowned by success in a much shorter time if he have a notice of the above quoted indications.

Lapageria rosea and *Tropeolum speciosum* do not grow to the best advantage in a southward position; *Ranunculus Lyallii* is restrained by season or climate; *Disa grandiflora* not only demands peat but a particular sort of peat; *Cattleya citrina* wants to hang head downward—and many more cases could be cited. Certain bulbs from the Cape may lie dormant in the soil for more than a year according to their native habits, and others are so particular as to the time of flowering, or rather opening their flowers (like *Cereus grandiflorus*), that the most skilled gardener can do nothing to alter that time in our latitudes. *Mae Leichlin, Zalen-Zalen*.

— The discussion on this subject, which was opened by Mr. Dyer, and carried on by Mr. Elwes and Mr. Burbidge is undoubtedly a very important one, and the different opinions hitherto expressed go to prove that even authorities on the questions at issue are by no means unanimous as to the ways by which the cultivator may attain the greatest success. The few remarks I have to offer are neither those of the gardener nor of the botanist, but of the simple observer of Nature. Mr. Dyer remarks:—"Granted that everything is known as to the physical conditions under which a plant grows in the tropics, is the gardener who attempts to grow it much better off?" We may eliminate the word "tropics" from the sentence, because it is doubtful whether tropical plants as a class give the cultivator more trouble than those from temperate climes. To the question propounded I would answer decidedly, Yes!—always provided that he tries to imitate those conditions intelligently. Mr. Burbidge put the case very concisely when he says that "Nature carries matters far past the point at which the gardener stays his hand." What intelligent gardener allows his plants to exhaust themselves by seeding—unless, of course, such seed is wanted for special purposes? Take the *Kew Plonions* which have been already cited. What would their condition be if they had to mature a crop of seed every year? Would they compare so very favourably with native plants? Nor should it be forgotten that the struggle for existence, from which no plant in a state of nature can possibly be exempt, is specially guarded against by the cultivator. These two conditions alone are sufficient to account for the undoubted improvement so often seen in plants under cultivation. They could, in my opinion, be partially, if not equally, secured by the cultivator without removing the plants from their wild stations, if he so willed. Mr. Dyer says, "The conditions under which plants exist in Nature afford very little real information for cultural purposes." My own observation points in an entirely opposite direction, and I may add, the excellent paper from the pen of Mr. Harry Vetch in a recent number of the *Journal of the Royal Horticultural Society*, entitled "Orchid Culture Past and Present," is based almost entirely on the same principle. What are the essential conditions under which plants exist in Nature? is a question which may fairly be asked. I would reply, a fierce struggle for existence is everywhere being carried on, and a plant maintains its ground only by having solved the problem of how best to exist under the given circumstances. Introduce a new competitor which is able to solve the problem a little more closely, and it will inevitably prevail in the contest. The plant may be existing "where it can," but it is none the less certain, that were it not fairly happy under the given conditions, it must take its place with the vanquished. Observation teaches this fact again and again.

The numerous cases cited, of plants succeeding

under totally different conditions, would indicate that the constitution of those species was the reverse of "singularly inelastic," if it indicates anything at all; and when one looks at the wide range of many species, and the diversity of conditions under which they grow, the conclusion is inevitable that their constitutions are sufficiently elastic. And here, perhaps, would be an infallible guide for the cultivator, were he able to avail himself of the necessary information.

If a plant grows in a variety of situations, a considerable variation in vigour and floriferousness will be observed, and by a judicious comparison of conditions and results, the elements of success may be arrived at—that is, if those conditions can be imitated in their essential particulars. The difficulty is that there is so great a variety of conditions to be imitated, and the gardener who has but half-a-dozen climates at command cannot possibly grow everything. Those who have from twenty to forty are more fortunate, but they, too, have to confess that certain plants are quite intractable subjects.

Granted that many plants improve under cultivation, and setting aside the fact that much of this is due to the cessation of the struggle for existence, must it not also be affirmed that an equal—nay, a far greater—number distinctly deteriorate, or refuse to grow altogether, simply because they are placed at a disadvantage as compared with the conditions under which they grow naturally? I think the fact cannot be denied. Nor can it be for one moment asserted that if these conditions were secured, there would be the same failure to deplorable.

The position taken by Mr. Elwes seems to be the correct one. Practically, it amounts to this: that a correct knowledge of the conditions under which any plant grows naturally is of great value to the cultivator—and with this I fully agree. *Observer*.

— I see nothing in Mr. Dyer's letters but what is very true and very useful to gardeners. He does not say, and no practical man can think that there is no use whatever in a knowledge of the climate and soil, &c., in which a plant grows in its native country, but as they do not, any of them, naturally grow in hot-houses, it is in the first place impossible in England to grow the natives of hot countries under natural conditions. Practically, it is entirely a matter of experiment and experience what treatment will suit a new hot-house plant. *Disa grandiflora* may thrive in black peat, but some other *Disas* from the same soil and climate will not grow in black peat, or apparently in any other soil in an English greenhouse. Three epiphytes may come from the same branch of a tree in the tropics, one of which will only thrive on a bare block, a second will only prosper in a pot with loam, and the third will not grow under any conditions in a hot-house. In the matter of hardiness itself, plants from the same locality differ greatly. How many Australian plants are as hardy as *Schizostylis cucinea*, or Cape plants, as some of the *Tritomas*? Strictly speaking, not only every species, but every individual plant, has a constitution of its own, which requires to be studied, as risers of new seedling varieties well know. *C. B. S. Gard.*

— Whether we agree with the Director of Kew or not, I think we are all much indebted to him for starting this discussion, and for starting it in such a way as to provoke the lively answers that have followed. I hope we may still have many more such letters as those from my friend Mr. Elwes and from Mr. Watson. As my name has been mentioned, I may without presumption add my little experience. I am in the position of very much agreeing with the Director (though not entirely), and also very much agreeing with Mr. Elwes (though also not entirely), and my only objection to Mr. Watson's excellent letter is, that he has said better than I could very much, what I should like to say; still there is room for me. I have little doubt that the Director, holding a brief for Empiricism v. Botanical Knowledge, stated the case of empiricism stronger than he would always do, and knowing something of Mr. Elwes' love of geography, and his great knowledge of botanical geography, I am not surprised

that he has stated his case—certainly in stronger terms than I should. But surely there is not really any great antagonism between them. We surely shall all agree that any knowledge of the life history of a plant, whether it is a knowledge of its botanical affinities or a knowledge of its geographical history, must be more or less useful to a cultivator, but all who are out-of-door students of plants must have found that such a knowledge very often goes a very little way in helping them to grow the plant successfully, and is sometimes actually misleading. Hundreds of growers are in the position that Mr. Watson describes when they get plants of whose botanical, or geographical history they are very ignorant. They must feel their way, guided partly by the little knowledge they may have of the native habitat of the plant, and partly by the instinctive knowledge of a plant's requirements which a cultivator of long experience acquires, and which he applies to a new plant, sometimes, of course, making mistakes, and sometimes scoring the great successes that Mr. Watson records. It has been my great pleasure in gardening to experiment with almost any plant that I can get, and if I know something of the country, so much the better. It is several years since I was told by some one that all Japan was a great damp shrubbery. Ever since that I have made it a point to give Japanese shrubs partial shade, and I am sure they like it, but I should do the same if I was told that some particular shrub grew on sunny exposed spots in Japan, not because I doubted the information, but because I fancy all Japanese shrubs in England grow better in partial shade. But the fact is, that there is a great mystery in the whole matter, which would open a wide question for the most scientific botanists, but which I do not the least expect they can answer. I mean the question why a plant growing on a very limited area, and on well-defined geological situations, if removed into gardens, grows freely and spreads in every direction. Mr. Watson shows this in the case of some plants, but the plants he names, though well known at Kew, are probably unknown to many of your readers. I should like to illustrate it in three English plants. The Cornish Heath (*Erica vagans*) grows abundantly on the serpentine formation of the Lizard, but only on that formation; but bring it into the garden, and it will grow on almost any soil. The *Anemone pulsatilla* grows wild only on chalk or limestone; there is no difficulty in growing it on any garden soil. The common *Asparagus* is almost confined to Asparagus Island, constantly washed by the salt spray, and does not increase there; in our gardens it not only grows luxuriantly, but seeds in every direction. There are dozens of such examples, and they are proofs to my mind that if a cultivator confined his collection to plants growing on the same soil as he could give them in his garden, his collection would be a small one. But I must stop, though it is very tempting to say more, but before stopping, I must say that in one point I think the knowledge of the geographical history of a plant is of great importance—and especially a knowledge of the elevation at which a plant grows. Here I am in complete accord with Mr. Elwes, for my own garden has long ago taught me that it will have as little to do with plants that grow high at a high elevation (like the higher alps) as it will with plants that dislike lime in the soil, like the Rhododendrons, Azaleas, &c. Every gardener (and this is very conclusive) has its specialties, and the best gardener is the man who, in dealing with new plants, gets all the information he can about them from books or otherwise, and then, bringing his own experience of similar plants to bear on the stranger, he tries (it may be, and often must be, in many different ways) to make it as happy as possible; and so, with his knowledge and observation of practical results combined, he does, in nine cases out of ten, make the new comer even more happy in its new home than it was in the home of its birth. *Henry N. Ellis, Esq., Bitton Vicarage, Gloucestershire.*

HOME CORRESPONDENCE.

THE EUCHARIS OR BULB MITE.—I have watched the discussion at various times in the columns of the *Gardeners' Chronicle* on the above subject with very keen interest, and I think the weight of opinion seems to be on the side of destroying the affected bulbs immediately it is seen that they are attacked with the mite; and I am certainly in accord with those who think so. Your correspondent, Mr. W. H.

Stephens, p. 114, seems, however, to have been more fortunate with his bulbs than some of us. I think, however, that his bulbs could not have got very badly infested with the mite, or he would hardly have had such an easy victory over them. At all events, I did not find the remedy mentioned by Mr. Stephens to answer with me, when on taking charge here five years ago I found about a dozen pots of Eucharis about as badly infested with mite as they well could be. I shook out all the bulbs, and took off all the outer scales as far as the mite seemed to have got into them, and treated them in all other respects exactly as described by Mr. Stephens, with this exception:—In potting them up again I did not use any peat, in fact, I never use it for Eucharis, my experience being that they delight in a good, stiff, loamy soil. I found, however, that they, after throwing up a few sickly-looking leaves, still continued to get worse, and I shook them out again; I still further reduced the bulbs by taking off more of the outer scales, and soaked some of them in petroleum for some fifteen to sixty seconds, others I soaked in Fir tree oil, nicotine soap, soft soap and sulphur, and after this again rolled them in soot and quicklime, but all to no purpose. I finally shook them out in June, after battling with them for eighteen months, and laid them in the coping of a wall in the full glare of the sun for three months; and at the end of that time I examined them through a good lens, and found that there were still traces of the mite in them, and happening at this time to get the offer of a quantity of good sound offsets, I gave up the battle with the mite—though somewhat reluctantly—and paid every attention to the healthy stock, with the result that I now have about a score of good healthy pots—full of strong flowering bulbs; in fact, I have one specimen which is quite 4 feet through, and a yard high. In potting, I never use anything but good fresh loam and a fair amount of coarse river sand and charcoal; and the only liquid manure we use is made from cowdung and soot, with now and again a light sprinkling of Standen's manure. Should it ever be my misfortune to encounter the mite again, I should do as I have frequently seen the Editor advise correspondents to do—"burn the affected bulbs," a proceeding I have frequently advised a friend and neighbour of mine to take, who has been hoping against hope for the last two years to get the better of this formidable pest, with no better success up to the present than I myself had. *B. Ashton, Glossop Hall Gardens, Derbyshire.*

DIANTHUS FUNGUS Wet mild winters doubtless serve more rapidly to propagate fungus growths than do hard dry winters. In a market grower's place near here, he finds this season, fungus running riot amongst his usually very hardy, dark leaved Sweet Williams. No doubt this is the same fungus which occasionally attacks Carnations, but rarely in so virulent a form as is to be seen on the soft leaved Sweet Williams just now. Oddly enough, there seems to be two distinct strains of these dark leaved Sweet Williams, one, having foliage of unusual breadth and dark as beet leaves seems, in the same ground, to be quite free from the fungus. The grower purposes having all the more affected leaves of his plants picked off, believing that the latter will regenerate in the spring. I fear they will wear a very sorry appearance, and have advised the destruction of the lot to save the larger leaved sorts from harm. With my own florists' strain, nothing whatever of a fungoid kind is to be seen on plants of last year's raising, but old plants suffer a good deal from excessive watering on our stiff clay. *A. Dean, Bedford.*

FEMALE NUT BLOOMS—My assertion as to the possibility of female Nut flowers proving fertile even in the absence of catkins was perhaps too hurriedly based on remarks I had previously read in the *Gardeners' Chronicle*, I believe, from the pen of one of your botanical correspondents as to the fertile capacity of female flowers in certain cases in Nature where male flowers were absent. It appeared a week or two since, but I have not the number at hand just now to give exact particulars. Possibly the references made would not apply to plants in a state of cultivation. *A. D.*

MULTIPLE SPATHED CALLAS.—A week or two since a friend asked me to look at a very curious Arum Lily he had in his greenhouse, unlike any that had previously come under his notice. I found the flower to consist of three well-developed spathe; one about the usual size, and two smaller ones; there were also two rudimentary ones, making five in all. The latter were within the main spathe, the

former outside it. A second plant, whose spathe was not unfolded, showed evident signs of more than one spathe—how many could not then be told. A third plant had a normal flower, but in which fertilisation had taken place, and seeds were protruding at the base of the spathe. The original plant, of which these were offsets, had, I was informed, just produced an exceedingly large flower with a double spadix. Its peduncle was $1\frac{1}{2}$ inch thick, and after it had faded, a second smaller one, with its peduncle united to that of the first, appeared; in fact, a twin flower, similar to that occurring in *Lycaste Skinneri* and other plants, usually producing only unifloral scapes. There was nothing in the way of exceptionally rich feeding, high temperature, &c., to account for this apparent hereditary proclivity to produce abnormal flowers. The plants were growing

of London, that it is wholly unnecessary, I feel convinced that if the Society puts aside all idea of making the hall pay, and uses it only for the legitimate purposes of horticulture, there would be no difficulty in raising whatever sum may be required. *Wild Rose.*

VINCA MINOR VARIEGATA.—Can any of your readers inform me if there are two varieties under this heading? The one having white and the other blue flowers, the latter is now in bloom out of doors. I fancy we should have two varieties as stated, and both variegated. *Corkonian.* [Yes; there is a white flowered variety of *V. minor variegata*. Ed.]

CYPRIPEDIUM BUCHANIANUM ×.—Mr. R. H. Measures, of The Woodlands, Streatham, writes to

FIG. 21.—A HALL Laid out with beds, Berlin Exhibition.

in two little greenhouses in an ordinary terrace garden, quite cool, and in small pots. I have enclosed a photo showing the flower with the five spathe. *Greenwood Post, Monkstown, co. Dublin.*

A HALL FOR HORTICULTURE.—As the annual meeting of the Royal Horticultural Society is at hand, this subject might very well be left till then; but on seeing what I cannot but call the wild and unsuitable schemes put forward, I venture, as one who has had some little experience, to say that three things must be avoided:—1. Any commercial dealings, either in plants or flowers, as has been suggested—this may be left to Covent Garden and the stores. 2. To avoid anything like catering for public amusement (I own I am a little surprised at Mr. Shirley Hibberd's letter)—this, I think, would be derogatory to the dignity of a scientific society. 3. To avoid all refreshment arrangements—this would involve failure, and there is such abundance of facilities for satisfying the inner man in all parts

point out an error which unfortunately crept into the account of this plant on p. 73. It was raised by Mr. P. Osborne, when gardener to Mr. Buchan, of Wilton House, Southampton, whence it passed into the Streatham collection. Both Mr. Measures and myself regret the mistake, which was quite unintentional. It arose from the fact that Mr. Measures was ill with the prevailing epidemic, and the letter was written by an amanuensis. What he really intended to say was, that he considered *C. Buchanianum* to be the best hybrid then in flower in his collection; and that *C. Cythera* × and *C. Hera* × were two of the best that he had raised. No doubt the error in spelling the name arose in the same way, for it should be *Buchanianum*, after Mr. Buchan (not "*Buchananianum*"). *R. A. Rolfe.*

—I was surprised to read in this week's issue of the *Gardeners' Chronicle*, that *Cypridium Buchanianum* was raised in the collection of R. H. Measures, Esq., of Streatham, as that is not the case. *Cypridium Buchanianum*

was raised by me during the time that I was gardener to H. J. Buchan, Esq., of Southampton, and after whom it was named. The plant first flowered in December, 1887, and in the early part of 1888, I sold the specimen to Mr. Measures, *T. Osborne, The Grove Gardens, Teddington.*

THE MILDNESS OF THE SEASON.—Respecting the earliness of blooming of Snowdrops, p. 89, I would remark on the abundance of these flowers in Somersetshire. I did not take notice of the exact date of the first bloom appearing, but it was in the last week of December. Primroses have been in bloom with us since the middle of November, and are now very plentiful. The following plants are in flower in the open air:—Snowdrops, white Alyssum, scarlet Anemones, Polyanthus, Wallflowers, Primrose

heat in February has that effect, is proved by Mr. W. H. S. who has had an abundant supply of flowers since October. Had his Camellias been planted in an unheated house, they would not have flowered until Christmas or later; hence his plants grow in a proper situation, and he has to be congratulated on the advantages he enjoys. There are some varieties of the Camellia—evidently raised from the old variety, *C. variegata*, which have very bold foliage; I refer to *Coquetii*, *gigantea*, and *Marchioness of Exeter*. These are much more influenced by drought than others. Mr. W. H. S. does not inform us whether that part of the wall against which the plants are growing that drop their buds, is more thoroughly drained than the other part, nor does he give the names of those varieties, as he might then trace the causes, and find the cause of his plants,

ease with which it may be grown; in fact it is very accommodating so far as growing is concerned, inasmuch as it thrives either in a warm or cool temperature. It will not, however, blossom satisfactorily when always kept warm, and this peculiarity is commonly understood, and consequently we do not often find the plant grown always in the stove. I have had experience with it as a hothouse plant for some years past, indeed since two plants were divided rather severely to increase the stock of it, and the mutilated pieces have been kept for three years in a stove, with a view to rapid growth; and in this respect I am well satisfied; but during the time they have been subjected to heat few flower-spikes have appeared. Latterly the plants have been grown on a stage beneath the trellis in a Rose-house, which is kept cool, and here, in a lower temperature, and with more air afforded them, the leaves are firmer in texture, and shorter; and the plants after being placed in a warm house have become very profuse bloomers. Cool pits or frames answer admirably during the summer months for this plant, and doubtless there are *Cypripedium* other than those belonging to this group which would readily be amenable to cool treatment. Fibrous peat with a dash of sand in it is a good compost, and in the growing season weak liquid manure made of sheep's droppings promotes vigorous growth, and frequent applications of this are very useful after the pots have become filled with the roots. *Thos. Cooper, Healdre.* [A photograph showing a large group of *C. insigne* came with the above note. *Th.*]

FIG. 25.—A HALL Laid OUT WITH BUDS, SURROUNDED WITH BALCONIES, BERLIN EXHIBITION.

Polyanthus, Chrysanthemums, Fancies, winter Aconites, Violets, Christmas Roses, yellow Jasmin, Laurestinus, Arbutus, Periwinkle, Buttercups, common Primroses, common Daisies. I noticed in a Strawberry-bed to-day a mass of flowers, two of which were fully open, and should the weather continue mild for a few days longer, Crocuses will be in bloom—in fact, some are now in bloom in our neighbourhood. *W. L., Bath.*

CAMELLIA BUDS DROPPING.—Camellias are as hardy as the Portugal Laurel, but Mr. W. H. Stephens is quite right when he states, that if they are allowed to get dry, i.e., reduced to starvation and unhealthiness, they are liable to drop their buds. Both plants and animals reduced to that state are unhealthy. The reaction, after watering or feeding, is productive in each of injurious results. I need not explain how animals are affected, but Camellias drop their buds. The extremes of heat and cold affect Camellias by exciting or retarding growth; and that the application of

suffering as they do, in his own explanation, "if once a Camellia is allowed to get dry, after the buds are fully developed, dropping will surely follow *C. B. Saunders.*"

CYPRIPEDIUM INSIGNE.—Varieties of *Cypripedium*, thanks to raisers of seedlings, have become so very numerous already, that it is probable they will in the near future become as common for pot culture as the tuberous Begonia. I do not suppose that a more generally useful species or variety exists than the *C. insigne* and its varieties, although it is sometimes discarded to make room for plants which are inferior to it in many points. The blossoms, notwithstanding their beauty, may not be so attractive as some others; but how free flowering this plant is when it receives suitable treatment? We have specimens in 9-inch pots and pans, which carry from thirty to forty or more spikes, and some of these produce twin flowers. But a leading point is the strong constitution possessed by this species, and the

CULTURE OF WINTER CUCUMBERS.—With reference to the recent article on "The Culture of Winter Cucumbers," by your correspondent, Mr. James Douglas, there are two persons still here who remember well the half-span house in the yard of these works in which Cucumbers were grown. I believe, from about 1858 to 1863, with surprisingly successful results. At that time, however, the works were not built in to nearly such an extent as at present, and this part of Chelsea, in which rows of houses now stand consisted then of market gardens, and the atmosphere was in consequence purer and less impregnated with smoke. This house served as a pattern not only to the one built at Loxford Hall, and mentioned by Mr. Douglas in his article, but also became the type from which the Cucumber houses at Sandringham and many other places throughout the country were designed, and we have applications still for houses to be constructed exactly on the lines of the old, half-span house, originally standing in the yard. *Wm. Gray, Danvers Street H. Stephenson Works.*

DRACÆNA LINDENII.—We have a plant of *Dracæna Lindenii* here, which has been much admired by all who have seen it; it was also very favourably noticed at the summer show at Bowdon. About three years since, it was a plant about 15 inches in height, growing in a 7-inch pot; it is now 8 feet 6 inches high, and is bearing a flower stem about 2 feet in length. It has been in bloom now for about three weeks. The flowers are of a pale drab colour, not showy, but pleasing when fully expanded, which is generally early in the day. It has 108 leaves, many of them over 2 feet long; and the habit of the plant as is well known, is most graceful. Plants of this species from 2 to 1 feet high are beautiful objects for house decoration, and they are much admired for that purpose here. This plant was potted two and a half years since, from a 7 to a 12-inch pot, in which it still is; and the soil used consists of equal parts of turfy loam, peat, and Gask-afmont, some half-inch bones and wood charcoal being mixed throughout the compost. The temperature maintained is from 55° to 85°, with abundance of moisture—sprinklings of Standen's, and Clay's Fertilizers being used at intervals. *H. Ellis, Lignwood, Boston.*

THE GARDENERS' ORPHAN FUND.—The scheme of a reserve fund was decided upon at the first meeting, and at that time the idea of a good invested sum was considered by all to be the right one. The importance of this was so strongly felt by all concerned, that Rule 5 was framed in a very stringent manner, with the express purpose of building up this fund. Even so late as about the time of the second election, there were not wanting some who went so far as to assert, and prove to their own satisfaction at any rate, that too many children were being placed on the fund, that there was insufficient money to meet the demand, and that therefore we were practically insolvent. Now, after two years' experience, some of our friends appear to be of a

directly opposite opinion, and seem to be in favour of a "spend all and save nothing" policy—an extreme infinitely worse than the other. I am glad to see that Mr. Dean does not adopt this view; but is in favour of still investing a fair sum, although not quite so much as we have hitherto done. His views, in fact, are much the same as mine, except that I should prefer to defer making any alteration in Rule 5 for perhaps another year. There is no doubt, that as the fund progresses, this rule will be found too restrictive, and alteration desirable, on the grounds fairly stated, that the responsibilities are small. Mr. Dean suggests that 75 per cent. of the legacies and donations should be invested, and that the remaining 25 per cent., together with interest on invested monies and subscriptions, should be available for the orphans and general expenses. At present, it might be found wise to put by 75 per cent. of donations, in case of a rainy day; but if the fund progresses as it has hitherto done, it will soon be found quite unnecessary to invest so large a sum; indeed, as the fund increases in age, and becomes (as we hope to see it) well and universally supported throughout the entire kingdom, the proportion of income which prudence dictates should be invested, would gradually diminish. In order, therefore, to avoid the necessity which would from time to time arise for altering this rule, I would suggest that, whenever the alteration be made, the present arrangements respecting investments should be done away with, and the entire matter be left to the discretion of the committee. With free hands, they would then be able to deal with each year's income to the best advantage, as the exigencies of the time and prudence might dictate. *Geo. Deal, Chairman of Executive Committee.*

FOREIGN CORRESPONDENCE.

BERLIN INTERNATIONAL HORTICULTURAL EXHIBITION.

The great International Horticultural Exhibition to be held at Berlin from April 25 to May 5, will in all probability be a magnificent affair. The accompanying plans, for the use of which we are obliged to the Editor of the *Gartenflora*, may help to show the scale on which it is projected.

This exhibition will differ from all the foregoing ones as illustrating for the first time the relationship of decorative horticulture and architecture.

The site of the exhibition is the large park and palace in the north-west of Berlin. It is the most suitable place for exhibitions, as it is situated between two railway termini, that of the Berlin-Hamburg, and of the Berlin-Lehrte Railway. Besides these there is a third station of the great circle railway, from which there is a direct entrance to the exhibition park. Goods arriving in Berlin have thus not to make a long transit through the town, but will be brought in a few minutes of their destination.

The exhibition park is the one in which was held the great Horticultural Exhibition of 1885; but whilst this latter was chiefly in the park, and only a few objects were shown in some of the compartments of the palace, this year the whole palace is allotted for the exhibition. In the park will be shown hothouses, greenhouses, &c., partly in full work, and containing Orchids and other fine hothouse plants. A large hall, side by side with the palace, will contain instruments, &c.

Our fig. 23 shows the general scheme of arrangement in the palace. The experience of the last show encourages the hope that there will be enough space for exhibitors. The space for exhibitors is as follows:—

1. Decorative part, about 400 square metres.
2. Hot and greenhouse plants, 1,550 sq. metres.
3. Roses, 300 sq. metres.
4. Forced flowering shrubs, 300 sq. metres.
5. Perennials and bulbs, 300 sq. metres.
6. Cut flowers, leaves, fruits, and dried flowers and grasses, 250 sq. metres.
7. Trees, shrubs, &c., for gardens, 650 sq. metres.
8. Fruits and vegetables, 60 sq. metres.

But in addition to these there are the rooms

destined for banquet-rooms, salons, dining-rooms, winter gardens, &c.

The entrance is in the principal hall, a; in the middle of this is a large fountain, and at the four corners jets of water run out of the wall. All these fountains will be decorated by plants.

There are also fountains in the halls, b, c, d, g, i, s, and t; which will give an opportunity to the exhibitors of group XIII., No. 348, to arrange their groups.

From the hall, a, we come to the opening hall, n, so called because the opening ceremony will take place there. The decorations are to be made by the exhibitors of group I., No. 10 to 13. At the right hand of this hall there is a platform for their Majesties. Decorative plants of group I., No. 10 to 13, are also to be found in the hall c.

Through a portico a passage is made from a into the hall a; this as well as the halls b, b, the centre of c, the hall d, the centres of g, h, and i, are destined for group IV. (house plants). The halls b and h, will be laid out with little beds (see fig. 24). Fig. 25 shows an enclosure with beds surrounded by balconies upon pillars.

The decorations will be made by low-growing plants; the balconies will also be decorated. Over the entrances to these enclosures are balconies, and between them, windows, which are all to be decorated by the exhibitors in competition. According to the number of the exhibitors, pillar balconies, free balconies, and prominent windows, will be constructed in all the halls in the centre axis of the exhibition palace, the decoration of all of which is to be competitive.

The end of this architectural design forms a large portico from the hall, g to i. A large terrace connects both.

The hall c, between a and d, allows of the construction and decoration of pagodas and pavilions.

From the hall, d, we pass to the right and left, as well as to e, in the refreshment rooms. In e will be a band-stand. These three halls are connected by curved paths; along the latter are placed the circular enclosures, f, f, destined for the products of nursery-gardens (trees, shrubs, cordons, &c.). Similar exhibits will also be placed in the halls g, h, i. In i will be constructed a large carpet-bed of spring flowers and carpet plants. To the left of i is the hall m, destined for the illustration of landscape gardening and the exhibition of garden literature. The neighbouring hall, n, is destined for meetings. To the right of i are the halls b, b, allotted to scientific exhibitions. Beside the hall h, right and left, lay the halls k, k, destined for winter garden decorations; they are each 17 by 9 metres. From g we pass on the left to the hall, z, which will contain fruits and vegetables. Through a music-saloon we come to y, which, together with x and w, is devoted to perennials and bulbs. In w, as well as in c and v, the plants will be exposed, which are in the Groups I., No. 2, 3, 4, and 5 of the programme, relating to the decoration of parlours in general and for festivities, such as baptisms and nuptial ceremonies, also for the decoration of family vaults. Each compartment is 63 by 7 metres. For each of these numbers of the programme two prizes are offered—one for horticulture, the other for architecture. In the halls t, n, v, will be placed the Roses. From the hall t, we come through the two large halls c, c, in the hall s. The halls c, c, are destined for group I., No. 1 (brilliant decoration of a festal salon). Each is 19 by 24 metres.

The halls q, r, s, will contain forced flowering shrubs, whilst p will contain the table decorations, and s the arrangements of cut flowers, leaves, fruits, dried flowers, grasses, &c.

Horticultural Sculpture (group XIII., No. 349, of the programme) will be found in the halls f, g, h, and i.

The exhibition is to be an international one. It will be of much importance to English gardeners to take part in it, as a great many medals will be offered for competition. His Majesty, the Emperor, has given a large gold medal; many other medals and prizes are already offered.

The railways will charge only half rates for all objects sent to the exhibition. The committee (Comité der Grossen Allgemeinen Gartenbau-Ausstellung, Berlin N., Invaliden-strasse, 42) will send programmes to any applicant on application. To accelerate the expedition of goods at the frontier, red labels are supplied by the committee, and which are to be affixed to the goods. No applications to take part in the exhibition will be entertained after March 1.

The last Chrysanthemum show made it evident that English gardeners succeed well at German exhibitions, as the only English exhibitor got the 1st prize—the Gold Medal. May this be an incentive to others to become competitors. *Our Berlin Correspondent.*

TRADE NOTICES.

A NEW ENTERPRISE.

We hear that Messrs. R. Sankey & Son have taken 50 acres more land at Bulwell, Notts, the underlying clay of which is very suitable for the manufacture of pots.

Mr. John Kitley, from Rothiemurchus, Inverness-shire, has taken the gardens of Warwick Castle, where he intends carrying on the business of a nurseryman and florist.

THE WEATHER.

[By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration, of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees—i.e., "Day-degrees" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.					RAINFALL.		BRIGHT SUN.		
	ACCUMULATED					10ths Inch.	In.	Per cent.	Per cent.	
	Above (+) or below (—) the Mean for the week ending January 25.	Day-deg.	Day-deg.	Day-deg.	Day-deg.					
1	1	0	38	+ 49	59	3	21	6.7	15	7

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, S.E.; 4, England, E.; 5, Midland Counties; 6, England, S. Principal Grazing Ac., Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending January 25, is furnished from the Meteorological Office:—

"The weather has continued in a very rough, changeable, and rainy condition, over the entire kingdom. Over Ireland, Scotland, and most parts of England, the rainfall was occasionally heavy, and in a few instances was accompanied by thunder and lightning. During the intervals of comparative quiet the sky was generally clear and bright, and the air pleasant.

"The temperature has been rather unsteady, but has continued a little above the mean over England and in the North of Ireland, and has equalled the mean in the west and east of Scotland, and in the south of Ireland; in 'Scotland, N.' however, a slight deficiency is shown. The highest of the maxima, which were recorded on the 25th, ranged from 50° in 'Scotland, N.' to 56° in most of the English districts, and in 'Ireland, S.' and to 57° in 'England, N.E.' On the 23rd (when the thermometer was very low over Scotland) the daily maximum at Aberdeen was as low as 28°. The lowest of the minima were registered between the 21st and 23rd, and varied from 14° in 'Scotland, E.' and 15° in 'Scotland, N.' to 33° in 'England, S.' and to 38° in the 'Channel Islands.

"The Rainfall has been more than the mean in all districts. Over southern and eastern England the excess has been somewhat trifling, but in nearly all other districts it has been large.

"Bright sunshine does not differ much from that recorded last week, the percentage of the possible amount of duration having ranged from 15 to 24 in Scotland, and from 14 to 32 over England. In Ireland the percentage was 30, and in the Channel Islands, 19."

MARKETS.

COIT'Y GARDEN, January 30.

BUSINESS very dull, and prices of imported goods much lower. Grapes realising better values. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Apples, 4-sect. ... 1 6-7 0	Lemons, per case ... 12 0-20 0
— Nova Scotia, bl. 12 0-25 0	Pine-apples, Eng., lb. 10 1-15
Cobs, per 100 lb. ... 130 0-140	— St. Michael, each 2 0-6 0
Grapes, per lb. ... 2 0-4 0	

VEGETABLES.—AVERAGE RETAIL PRICES.

Asparagus, English, per lb. ... 8 0-10 0	Mustard and Cress, punnet ... 0 4-...
Beans, French, lb. ... 0 8-1 0	Onions, per bunch ... 0 4-...
Beet, red, per dozen ... 1 0-2 0	Rhubarb, per bunch ... 0 6-...
Carrots, per bunch ... 0 6-...	Rhubarb, per bundle ... 0 6-...
Cauliflowers, each ... 0 6-1 0	Seakale, punnet ... 2 0-...

ORCHID-BLOOM IN VARIETY.

PHLOXAS.—Market quiet. Best red-sold Magnolias and Regents, 100s.; Yorks (M.G.), 95s.; other samples vary from 45s. to 85s. per ton. First arrival of Canary New Potatoes to hand.—Kidney, 10s. 6d. 22s.; Rounds, 19s. to 15s. per cwt. J. B. Thomas.

SEEDS.

LONDON: Jan. 29.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, report a moderate business doing. Choice samples of home-grown red Cloverseed are scarce, and command full prices. Ordinary qualities of both English and Continental growth are cheap and abundant. More money is asked for Alsike. White Cloverseed is firm. There is no change in Trefoils. Rye-grasses are neglected. Blue Peas show no movement. Unusually low rates prevail for Canary seed. Good black Rapeseed is wanted. For Mustard the sale is slow.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quart-p), for the week ending January 25:—Wheat, 30s. 1d.; Barley, 32s. 2d.; Oats, 18s. 7d. For the corresponding period last year:—Wheat, 30s. 1d.; Barley, 26s. 7d.; Oats, 16s. 6d.

FRUITS AND VEGETABLES.

SPITALFIELDS: Jan. 29.—Good supplies of green vegetables, English and foreign fruit, &c. Demand fair. Potato trade very quiet. Prices:—English Apples, 4s. to 6s. per bushel; American do., 16s. to 20s. per barrel; forced Rhubarb, 1s. to 1s. 6d. per dozen bundles; Savoy, 2s. to 3s. 6d. per tally; Cauliflowers 6s. to 9s. do.; Curley Kale, 1s. to 1s. 3d. per bushel; Seakale, 1s. to 1s. 6d. per punnet; Spinach, 1s. to 1s. 3d. per bushel; Brussels Sprouts, 9d. to 1s. 6d. per half sieve; Turnip-tops, 1s. 6d. to 2s. per sack; Sprouting Broccoli, 1s. to 1s. 6d. per dozen bunches; Turnips, 1s. 6d. to 2s. 6d. do.; Carrots, 2s. to 2s. 6d. do.; Parsley, 2s. to 2s. 6d. do.; Cabbage Lettuce, 1s. 6d. to 2s. per dozen; Endive, 1s. 6d. to 2s. do.; Leeks, 1s. do.; Mustard and Cress, 1s. to 2s. per dozen baskets; Beetroot, 3d. to 4d. per dozen; Parsnips, 4d. to 8d. per score; English Onions, 7s. 6d. to 9s. 6d. per cwt.; Spanish do., 8s. to 8s. 6d. per case; Dutch do., 6s. 6d. to 7s. per bag of 110 lb.; Belgian do., 6s. 6d. to 7s.; Bordeaux do., 7s. to 8s. per case; Celery, 4s. to 12s. per dozen bundles; Horseradish, 1s. to 1s. 3d. per bundle.

STRAFORD: Jan. 29.—The supply has been good during the past week, and a fair trade was done at the following prices:—Cabbages, 1s. 6d. to 3s. per tally; Savoy, 5s. to 6s. do.; Turnips, 2s. to 3s. per ton; Carrots (household), 20s. to 40s. do.; do. (cattle feeding), 20s. to 24s. do.; mangolds, 11s. to 15s. do.; Swedes, 11s. to 17s. do.; Onions, English, 10s. to 10s. 6d. per cwt.; do. Spanish, 7s. 6d. to 9s. per case; Apples, English, 2s. to 6s. per bushel; Watercress, 6d. per dozen; Celery, 6s. to 5s. per dozen rolls; Sprouts, 1s. 6d. to 2s. 6d. per flat.

POTATOS.

BOTHAMPTON AND SPITALFIELDS: Jan. 28.—Quotations.—Regents, 55s. to 58s.; Hebrons, 40s. to 400s.; Magnum Bonum, 35s. to 75s.; Scotch, 60s. to 100s.; Imperators, 40s. to 70s. per ton.

SPITALFIELDS: Jan. 29. Quotations.—Magnum, 6s. to 70s.; Regents, 55s. to 70s.; Champions, 6s. to 70s.; Imperators, 55s. to 70s.; Hebrons, 50s. to 60s.; Early Rose, 4s. to 50s. per ton.

STRAFORD: Jan. 29.—(Quotations)—Scotch Regents, 60s. to 70s. do., Magnum, 60s. to 80s.; light English do., 50s. to 65s., dark do., 40s. to 41s. 6d. per ton.

HAY.

Averages.—The following are the average prices obtained at the various metropolitan markets during the past week:—Clover, prime, 78s. to 83s.; do., inferior, 40s. to 70s. Best hay, 60s. to 90s.; do., inferior, 25s. to 50s. Straw, 25s. to 40s. per load.

Obituary.

WILLIAM WILDSMITH.—Our readers will learn with much regret that we have to announce the death of the well-known head gardener at Heckfield. After a short illness he passed away on Wednesday night last, January 29. Mr. Wildsmith has had charge of the gardens at Heckfield Place, Winchfield, for about twenty years, having been previously to the gardens in a subordinate capacity.

Since the severe shaking Mr. Wildsmith sustained some time since, through an accident when driving, he has been somewhat enfeebled, although his lively spirits were by no means subdued. He has been for some years a member of the Royal Horticultural Society's Fruit Committees, and attended the last meeting on January 14. Under his charge the gardens at Heckfield have been maintained in a thoroughly satisfactory manner, for, although a fruit grower, he was also a good all-round gardener, as the flower garden at Heckfield alone will testify. We hope next week to give further information.

LAW NOTES.

PROSECUTION OF A SALESMAN.

FREDERICK WISE was, on Thursday last, again charged at Bow Street, under the conditions already published, and committed for trial, subject to a formal remand.

NOTICES TO CORRESPONDENTS.

CREOSOTED CONSERVATORY TIMBERS: C. B. We have some slight recollection of having answered your inquiry at or about the time it was made. The timber once having been saturated with creosote—a preparation from Beech tar—nothing will again clear it, and a house built with such timber will be permanently unfit for plant growing.

DOBBIE'S-PATHED ARUM: T. A. H. Not at all uncommon.

EXCHANGE.—Hare's-foot Ferns wanted in exchange for Soap-nuts. Address, G. H. P., 6, Morpeth Street, Spring Bank, Hull.

HELMGOLD: H. R. See Bentley & Trimen *Medical Plants*, or consult Pritzels *Index Iconum* for a complete list of figures.

ISSUES: J. Ross. The grub set is that of the Wood Leopard Moth, *Zozera aesculi*. The caterpillar should be killed by inserting a stout wire into its hole, or by forcing into the cavity some insecticide through a sharply-pointed nozzle.

NAMES OF PLANTS: W. C. & S. *Crinum giquantum*, Andr., Bot. Mag., t. 5205. *Aster Chinesis*, Helechrysum paniculatum. — W. P. *Eupatorium Hageanum*, A. V. Z. The plant sent as *Melia Azederach* is *Duranta Plumieri*. B. M. 1, *Taxodium sempervirens*; 2, *Cyperus sempervirens* var.; 4, a species of *Callitris alius Frenela*, we cannot tell which species. Please say whence the specimens were derived. A. W. 1, *Bulbophyllum auricomum*; 2, *Dendrobium Johannii*; 3, D., *teretifolium*.

PHOSPHATE OF LIME: A. P. This substance, required by most kinds of cereal and root crops, is found largely in bones and fossil phosphates, but being largely insoluble in water, it must be rendered soluble (biphosphate of lime), by the addition of oil of vitriol of a specific gravity of 1.70 to 1.75, and obtained as "brown acid." The proportions are: For coprolites, 20 cwt. 17 cwt. of brown acid, and 3 cwt. of water; for bone-ash superphosphate, 20 cwt. bone-ash, 16 cwt. brown acid, and 2½ cwt. water. In making small quantities of phosphate of lime for home use, it is a good policy to use as much acid as the bones will take up, and as a general rule the water should be added to the acid and not to the bones. It should be carefully mixed in a walled cistern. When thoroughly mixed, it requires to be dried, and this is best done by mixing with some dry materials, as burnt earth, fine ashes, &c. A good manure is made from one third bones and two thirds coprolites.

THE FORCING GROUND, NEW GARDENS: Charlotte B. For tidiness sake, the forcing ground and forcing houses of all kinds should be in an enclosure by themselves, there being at all times litter laying about, which, if this division form part of the kitchen garden, gets blown all over that department, causing constant labour in sweeping, &c. We often find long stretches of warm southerly walls in kitchen gardens that might be profitably utilised for Peach, Apricot, and Fig growing, given

up to form the back walls of vineries, &c., to carry a few shelves for Beans and Strawberries in the spring and winter.

TOMATO SEEDS GERMINATING WITHIN THE FRUIT: R. C. T. It will frequently occur when the temperature in which the fruit may be placed, is favourable to germination, and the seeds are enveloped in a pulpy cell mass. It may be noticed very commonly in Melons, Oranges, Cucumbers, &c.

TOMATOS: J. C. W. We should say that a rod 5½ feet high, if well grown, should yield about 10 lb. of fruit.

VINES AND EXTRA WARMTH AT THE FLOWERING PERIOD: W. Malvern Wells. Heat is beneficial at that period, because it acts favourably on the chemical changes that are then taking place within the flower. It also has the effect of causing the flowers on a bunch to open almost simultaneously. Hastening the flowering of any plant unduly is always in some degree injurious, but Vines will stand severe forcing for several years without ill effects, if heavy crops of fruit be not taken, and their general management is good. Only Vines with a restricted space for the roots, as one in a pot or tub, for instance, suffer greatly by being forced.

VIOLETS: A. W. Fitzwilliam. An excellent cultivator of the Violet, Mr. J. Heath, to whom we applied respecting the cause of failure, says:—"The Neapolitan Violet, when fairly well grown, begins flowering towards the end of August, and continues to do so more or less profusely until the end of April, and its persistence is such that it would be safe to say that in an untouched or undisturbed bed, a bloom, indifferent or otherwise, might be picked any day in the year. Not so with the Russian Violet, which generally gives a few flowers in autumn—say, September and October; its proper time of flowering being from February till end of April. Exceptions to this rule may arise from climatic influences, or from some exceptionally favourable situations and seasons, or from some check the plants may have sustained. Since your plants have made strong growth, and continue to be healthy, it is safe to say they will flower grandly at the proper time. The above is my experience in Scotland and the north of England. The Neapolitan and Marie Louise have the longest period of flowering of any of the varieties of Violets. Of course, if Russian Violets are in frames, they will flower more or less throughout the winter.

DIED. On January 23, at Hastings, HENRY CLARKE WEBBER, of Covent Garden Market, aged 41, younger surviving son of the late Michael James and Margaret Webber.

—We regret to announce the death of Mr. JAMES BELL, Head Gardener for seventeen years to Lord Blantyre, Erskine House, on Sunday, January 25, after an illness of eight months' duration, at the age of 54 years. He left a widow and four children.

HARTLAND'S 56 page "YEAR BOOK" OF SEEDS FOR 1890.

Within itself unique in the extreme. His "Book of Daffodils" has no rival in the United Kingdom. His "Book of Seeds" for 1890 is not like any other publication throughout the British Isles, and there are seeds and plants offered that no other house has yet attempted to offer. Send three stamps to cover postage, &c., and write for copy.

WM. BAYLOR HARTLAND, Old Established Seed Warehouse, 24, Patrick Street, Cork.

To the Trade.

H. AND E. SHARPE are prepared to make very low offers for all the principal kinds of Seed POTATOS, grown expressly for Seed purposes from the finest selected stocks. The samples are very good, and free from disease and diseased tubers.

CHARLES SHARPE & CO., SLEAFORD.

And see their Trade Mark is on each Package.

TOMATO "PRELUDE"

At the great trial of Tomatoes last year at Chiswick, where they were grown perhaps better than ever before, this variety showed its superiority from beginning to end; it produced by far the greatest crop of the finest sized, loveliest fruit, of delicious flavour, from the very ground up to our feet high, and with the least attention always sets well. It was over and over again pronounced by the best judges on the world the finest and most profitable Tomato of all by a long way; it also proved unmistakably the best in our 100 feet trial house, and the same report reaches us from all parts of the world. A real gold mine to market growers.

Awarded First-class Certificate by the Royal Horticultural Society.

1s. 6d. per Packet.

For Illustrations see our SEED CATALOGUE, of the greatest value to all possessing a Garden.

PERFECT SEEDS DIRECT ONLY from

For Green and Black Fly, American Blight, Camellia Scale, Red Spider, Mealy Bug, Brown and White Scale, Worms, Wood-bore, &c.

"PICRENA," THE UNIVERSAL INSECTICIDE.

SAFE—ECONOMICAL—EFFECTUAL. 15, PRINCESS STREET, EDINBURGH, July 15, 1887.—"Dear Sirs, I have thoroughly tested a sample of a new Insecticide which you were so good to send me. At the rate of 1/2 oz. to a gallon of water at a temperature of 75°. I took it kindly Green Fly immediately. Double this strength, or 2 oz. to a gallon at 120°, seals the fate of Scale of all sorts in a few seconds; while 2 oz. to a gallon at same temperature effectually destroys Mealy Bug, and so far as I have yet observed, without the slightest injury to leaf or flower, and is as withal a most agreeable compound to work with. All our insect remedies are applicable through common syringes, or garden engine, a much more rest of efficiency than when applied by hand-washing or spray.—I remain, dear Sirs, yours truly, (Signed) A. MACKENZIE, of Messrs. McIlvaine & Sons.

Victoria and Paradise Nurseries, Upper Holloway, London. January 7, 1888. "SIR, I have given your Insecticide, 'Picrena,' a good trial in competition with many others. I am pleased to say that I have found it to be more effective in destroying Mealy Bug and other insects than anything else I have ever used. It ought to command a good sale." (Signed) B. S. WILLIAMS.

Sold by Chemists, Nurserymen, and Florists, in Bottles at 1s. 6d., 2s. 6d., and 3s. 6d.; in Tins (1 and 2 gallons), 10s. 6d. and 20s. each, in quantities of 5 gallons and upwards, 9s. per gallon.

Prepared only by DUNCAN, FLOCKHART & CO., Chemists to the Queen, Edinburgh.

May be had from B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, London; and from WILLIAM EDWARDS AND SON, 157, Queen Victoria Street, London.

TOBACCO PAPER, best quality, 8d. per lb.; 14lb. 9s.; do. FIBRE, much stronger and better, 9d. per lb.; 14 lb. 10s.; do. Cord, 5s. per lb.; 28 lb. 10s. 28 lb. carriage paid to any station. Large reduction to the trade. FIBRE & CO., St. Andrew's, Bristol.

BENTLEY'S INSECTICIDE.

Mr. G. WYNN'S, Spyn House, writes:—"Bentley's Insecticide is a great saving in comparison to others. We use it largely, and it never fails to thoroughly eradicate all insect pests." For particulars apply to JOSEPH BENTLEY, Chemical Works, Farnley-on-umber, HULL.

NATIVE GUANO: BEST and CHEAPEST MANURE for Garden use, NATIVE GUANO. Price £13s. per ton, in bags. Lots under 10 cwt., 4s. per cwt. I can supply bagged from my large stock, to any station in England on receipt of P.O. for 5s.

Edwards from Thirteenth Annual Collection of Reports:—"NATIVE GUANO for POTATOS, VEGETABLES, FRUIT, &c.—I find it very valuable. I have given it to my garden, and say:—"I found your Native guano very satisfactory results."

C. J. WHITE, Gr. to Col. the Hon. W. P. Talbot, says:—"I can strongly recommend your Native Guano as a first rate Manure for any fruit or kitchen garden crops, also grass. In the 5 years during which I have freely used it, I have never seen 500 lbs. of NATIVE GUANO for ROSES, TOMATOES, &c.—W. G. BAILLY, Nurseries, Bexley, used it for Roses, Tomatoes, and Cucumbers, and says:—"I find it a good and cheap article."

A. F. BARNOR, Royal Horticultural Society, says:—"Without doubt a very valuable Manure, and easy of application." Orders to the NATIVE GUANO CO., Limited, 29, New Bridge Street, Blackfriars, London, E.C., where Pamphlets of Testimonials, &c., may be obtained. Agents wanted.

The Best and Cheapest Fuel for Greenhouse Boilers, Stoves, and Heating Apparatus.

HENDREFORGAN ANTHRACITE SMOKELESS COAL.—THE UNITED ANTHRACITE COLLIERIES (Limited) supply their Nut or Cobble Coal (the Nuts being about the size of a Walnut, and the Cobbles about the size of a man's fist), delivered in truckloads to any railway station. This coal is ADMIRABLY SMOKELESS, and it requires much less attention than any other description of fuel, burning for twelve hours AT LEAST without any supervision, and giving from five to ten degrees more heat than coke. Quotations can be had on application to the Company's Offices, 23, Lime Street, London, E.C. Quotations for London delivery can be obtained for the Northern, Western, and South-Western districts, from Messrs. G. R. CARTER and SON, Coal Exchange, E.C.; and for the South-Eastern district, from Messrs. W. DOWELL & CO., Coal Merchants, Greenwich, S.E.

CHARLES FRAZER'S EXECUTORS, HORTICULTURAL BUILDERS, NORWICH.

No. 55.—Span-roof Garden Frame. The illustration shows a Frame 8 feet by 6 feet. Made of good Farnwood deal, sides and ends 1 1/2 inch thick, painted three coats of oil colour; lights 2 inches thick, glazed with 21-oz. sheet glass. Height of sides, 14 inches. Height at ridge, 32 inches. The lights are hinged and fitted with "Registered" Set-screws, which safely support them for ventilation. Arcs, and the hinges are so formed that the lights can be turned quite over, or taken off at pleasure.

WANTED, a MAN, of good character, to Assist Stoker, and make himself generally useful in Nursery.—H. B. MAY, Dyson's Lane Nursery, Upper Edmonton.

WANT PLACES.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested to send to give their Names and Addresses, and also a Reference to the Advertisements which they were retained.

Gardeners, Foresters, and Farm Bailiffs.

LITTLE and BALLANTYNE, The Queen's Nurserymen and Seedsmen, Carlisle, invite correspondence with Landed Proprietors, Agents, and others requiring the services of GARDENERS, FORESTERS, and FARM BAILIFFS. Their extensive business relations throughout the Kingdom enable them to distinguish men of good character and ability, such as they would be glad to recommend.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, (formerly) are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

HEAD GARDENERS.—At the present time I can recommend several highly respectable MEN, of known ability and first-class character.—THOS. BUTCHER, Seed Merchant, Croydon.

RICHARD SMITH and CO. beg to announce that they are constantly receiving applications from gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Head Gardeners.

Hackney Union.

EMPLOYMENT FOR LADS WANTED.

THE GUARDIANS of the HACKNEY UNION desire to obtain INDOOR SITUATIONS for a number of LADS who have been trained in Baking, Tailoring, Shoemaking, and Farm, Garden, Dairy, and General House Works, and have passed the required standard of education. Apply at once to the SUPERINTENDENT, Hackney Union Schools, Brentwood, Essex.

HOLLOWAYS' OINTMENT and PILLS.

Rheumatism and Neuralgia.—Though the former disease more readily attacks persons of all ages, and the latter ruthlessly selects its victims from the weak and delicate, the persevering use of these remedies will infallibly cure both complaints. After the affected parts have been diligently fomented with hot brine, and the skin thoroughly dried, Holloway's Ointment must be rubbed in firmly and evenly for a few minutes twice a day, and his Pills taken according to the printed directions on each round cork box of his medicine. Both Ointment and Pills are accompanied by instructions designed for the public at large, and no invalid, who attentively reads them, can now be at any loss how to doctor himself successfully.

GOLD MEDAL.

Quite the most original CATALOGUE in the Trade. Terms and Prices certainly the best. Post-free to every applicant.

Every Gardener should see this List, because a number of exceedingly good things can only be had from us. We very urgently indeed press gardeners to write for this List.

The New Japanese Primulas, the most startlingly remarkable flowers ever raised in this group. Destined to be as generally known as *Primula sinensis*. Most highly praised by every horticultural paper, and by the Times and London Press. Three Medals in three weeks. These are of such very special character, and will be so much talked of this spring, that every lover of choice flowers should see our full account of them in Catalogue.

Gold Medal for Tuberous Begonias.—The cheapest in the trade. Every lover of good Begonias should see our List. We have been delightfully successful, and our strain is grand beyond all description.

Seeds that Give Satisfaction.—Our great strength as a seed firm, and the cause of the extraordinary growth of our business, is the splendid quality of our strains of flowers, and the front rank reputation we have for Exhibition Vegetables.

£50 in Prizes and Two Medals are offered by us to our customers only, on so ingenious a plan that all can compete on fair and equal terms, wherever they may reside. All who can grow things well should see our Catalogue.

The best proof of our confidence that our terms and prices are of the best is that we send our Grand, Illustrated, Descriptive, Full Cultural-note CATALOGUE, Post-free to every applicant.

RYDER & SON, SEED MERCHANTS, SALE, MANCHESTER.

Catalogues had of Mr. J. NEAL, The Nursery, Wandsworth Common, S.W., and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Wednesday Next.

5000 LILIUM AURATUM, every bulb in the previous auctionings having been sold. These are just to hand in splendid condition, and include some of the finest bulbs received this season; some of the roots are exceptionally fine. 7000 sorts of sorts, 10 to 20 feet; 2500 Fruit Trees, 200 Lilium auratum rufum vitatum, 200 L. auratum argenteum, 2000 L. Kramerii, 200 L. coridifolium, 200 L. Brownii, 1200 L. album Klotzianum, 1000 L. speciosum from Japan, 1400 L. auratum album, 400 L. montanum, 200 L. consolor; 600 named Border CARNATIONS of the best sorts; 200 AZALEA MOBILIS, 300 CAMELLIAS and AZALEAS, DECAISNEA, 100 RHODODENDRONS, and many other Plants from Belgium; also a great variety of English-grown LILIES and Hardy BULBS, LILIUM SPECIOSUM, an assortment of well-grown PLANTS, Greenhouse and Store FERNS, DECORATIVE PLANTS, American PEARL TUBEROSES, Hybrid GLADIOLUS, TIGRIDIAS, ANEMONES, BEGONIAS, 300 Standard and Dwarf ROSES, choice named varieties, &c.

MESSRS. PROTHEROE and MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY NEXT, February 12, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

Maresfield, near Uckfield, Sussex.

Three miles from Uckfield Railway Station.

IMPORTANT Two days' SALE of remarkably well-grown NURSERY STOCK, particularly worthy the attention of Noblemen, Gentlemen, Builders, and others engaged in planting.

MESSRS. PROTHEROE and MORRIS will SELL by AUCTION, on the Premises, the Woodlands Nursery, Maresfield, near Uckfield, on WEDNESDAY and THURSDAY NEXT, February 12 and 13, at 12 o'clock each day, by order of Messrs. William Wood & Son, a large quantity of unusually well-grown NURSERY STOCK, carefully prepared for removal, consisting of 5000 Border Shrubs, including many handsome species, Evergreen Trees in various sizes, 100,000 large strong quick; 1000 large Laurels, 4 feet to 6 feet; 20,000 Scotch Firs, 2 feet to 3 feet; a great number of Standard Ornamental Trees, admirably adapted for avenue, park, and street plantings; One-centred Flowering Trees and Shrubs; 2000 Standard, Dwarf, and Climbing Roses; 2000 Climbers, from pots; 5000 Standard, Pyramid, and Dwarf-trained Trees, consisting of Apples, Pears, Plums, &c.; together with other Stock in flower and in bud.

May be viewed any day prior to the Sale. Catalogues may be had on the Premises; and of the Auctioneers and Estate Agents, 67 and 68, Cheapside, London, E.C.

Friday next.

Established ORCHIDS for Sale without reserve, by order of Messrs. J. W. Steel & Co., who are relinquishing their business.

MESSRS. PROTHEROE and MORRIS will SELL by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, February 14, at half-past 12 o'clock without reserve, a large quantity of various Established ORCHIDS, by order of Messrs. J. Steel & Co., specially suitable to gentlemen desirous of forming or adding to their collections.

On view morning of Sale, and Catalogues had.

Friday Next.

LILIA AURANTIALIS ALBA.

Consignment from Mr. Peckback for Unreserved Sale. Mr. Peckback writes that he guarantees every bulb to be true, and adds that "no more plants will be sold or sent because they are not to be found." The whole consignment, comprising 16 plants, will be offered in 15 lots. May of the consignment will be offered on the 10th inst. and sold on the March 1 and May 10 last year, have flowered, and all have turned out to be true.

A first-class Certificate was awarded to Messrs. Veitch & Sons for a group of plants that flowered from the consignment of last year.

MESSRS. PROTHEROE and MORRIS will include the above in their ORCHID SALE on FRIDAY NEXT, February 14, at half-past 12 o'clock, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C.

On view morning of Sale, and Catalogues had.

Friday Next.

CATLEYA SPECIES.

Offered for the first time, received from our oldest collector, who has been some months searching in the hitherto unexplored district, in and beyond the region whence come the wonderful varieties of C. Hardyana, C. Massiana, &c. The plants were not in flower when collected, but the most fleshy leaf-buds, having, would indicate its distinctness and great beauty. The plants offered in splendid condition, and are well-leaved, considering the long distance our man had to bring them from the forest of the interior of Ceylon. The fine condition they are now in, and the fact that we have never before seen a type of Cattleya (gas with such extraordinary bulbs and leaves, we think we are warranted in saying that this is a very desirable acquisition.

Splendid purple-flowering Dendrobium. CATTLEYA GASSELLIANA ALBA in flower. CATTLEYA GASSELLIANA.

From a hitherto unsearched district. One of our collectors, when searching for other Orchids, was surprised to find this species at such a long distance from where C. Gaskelliana has been found hitherto. As no other European has probably penetrated the forest to such an extent, many new varieties may be found in this consignment. A perfectly snow-white form has just opened from among this batch, and the plant will be offered for sale on February 14 as a "lot." The plants that are now being sold were brought by the native carriers of the forest on their backs during a journey of twenty-four days. The plants are well-leaved.

The new CATTLEYA HENSIANISA, DENDROBIUM NOBILE from Northern India, LILIA GRANA.

AN IMPORTATION OF ONCIDIUMS. From the Railway Wood of Northern Brazil. These plants are offered as received on backs, having been established by a native, hence they are in fine condition; many large masses are among them, and grand things will flower out of the batch, judging by the enormous flower spikes and fine leaf.

MESSRS. PROTHEROE and MORRIS will include the above by order of Messrs. F. Sander & Co., St. Albans, in their sale by auction at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on Friday next, February 14, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

February 20.

PETERS CRITICA CRISTATA. Good stuff in large tubs. Growth of the best 12s. per 100. Cash with order. GOWERS and THOMPSON, Camley Bank Nursery, Waltham-stow.

TOMATO "PRELUDE"

At the great trial of Tomatoes last year at Chiswick, where they were grown perhaps better than ever before, this variety showed its superiority from beginning to end; it produced by far the greatest crop of medium sized luscious fruit, of delicious flavour, from the very ground up to five feet high, and with the least attention always well. It was over and over again pronounced by the best judges in the world the finest and most profitable Tomato of all by a long way; it also proved unmistakably the best in our best trial houses, and the same report reaches us from all parts of the world. A real gold mine to market growers.

Awarded First-class Certificate by the Royal Horticultural Society.

1s. 6d. per Packet.

For Illustrations see our SEED CATALOGUE of the greatest value to all possessing a Garden.

HENRY CANNELL & SONS'

THE FOLLOWING STATEMENT SHOWS at once the great advantage in having our own home-grown VEGETABLE SEEDS direct from the most sunny spot and best soil, at nearly wholesale prices. It also gives the result of one of the most careful botanical tests perhaps ever carried out, the accuracy of which is given by one of the largest London Houses—

	No. of Seeds Germinated out of 100.
The Kent Crop, grown in Mid-Kent, soil light and early	80 to 90
Bedfordshire Crop, soil light, sandy, and early	55 to 70
Lincolnshire and Cambridgeshire Crop, soil flat, wet, and cold	40 to 45

The change of Seed coming from our rich calcareous soil acts on the vigour and productiveness all the season equal to half a coating of manure.

JAMES VEITCH & SONS, ROYAL EXOTIC NURSERY, CHELSEA, LONDON, S.W.

COLD MEDAL.

Quite the most original CATALOGUE in the Trade. Terms and Prices certainly the best. Post-free to every applicant.

Every Gardener should see this List, because a number of exceedingly good things can only be had from us. We very urgently insist upon gardeners to write for this List.

The New Japanese Primulas, the most startlingly remarkable flowers ever raised in this group. Destined to be as generally known as Primula sinensis. Most highly praised by every horticultural journal, and by the Times and London Press. Three Medals in three weeks. These are of such very special character, and will be so much talked of this spring, that every lover of choice flowers should see our full account of them in Catalogue.

Gold Medal for Tuberosus Begonias.—The cheapest in the trade. Every lover of good Begonias should see our List. We have been delightfully successful, and our strain is grand beyond all description.

Seeds that Give Satisfaction. Our great strength as a seed firm, and the cause of the extraordinary growth of our business, is the splendid quality of our strains of flowers, and the front rank reputation we have for Exhibition Vegetables.

£50 in Prizes and Two Medals are offered by us to our customers only, on so ingenious a plan that all can compete on fair and equal terms, wherever they may reside. All who can grow things well should see our Catalogue.

The best proof of our confidence that our terms and prices are of the best is that we send our Grand, Illustrated, Descriptive, Full Cultural-note CATALOGUE, Post-free to every applicant.

EAST LOTHIAN STOCKS A SPECIALTY.

True strain and extra fine, in five separate colours—Purple, Scarlet, White, Crimson, and White Wallflower-leaved—each colour 1s., 2s., 4d., and 5s. per packet.

MR. GLEN, The Gardens, Brambleby, writes:—"Please send me five packets East Lothian Stocks. I must say that your strain of East Lothian Stocks is the finest I have seen anywhere. When I was at Winton, I saw the plants of East Lothian Stocks supplied by you were admired by every one who saw them. We had upwards of 80 per cent. of double flowers."

MR. BAILLIE, The Gardens, Luton Hou Park, writes:—"The East Lothian Stocks from you were excellent. The white, purple and crimson exceptionally fine. Many spikes were over 15 inches long and densely clothed with bloom."

MR. LAMONT, The Gardens, Kennet House, writes:—"Please send me four packets East Lothian Stocks. This year I have the finest I ever had. They are the admiration of every one who sees them. The whites are over 90 per cent. doubles, which could not be better."

All other seeds of the same first-class quality only, notably the following, all saved from my own world-renowned collection:—

- PANSIES, show and fancy, 1s., 2s., 6d., and 5s. per packet. PENTSTEMONS, 1s. and 2s. 6d. per packet. ANTIRRHINUMS, 1s. and 2s. 6d. per packet. MIMULUS, 1s. and 2s. 6d. per packet. AUCHUA, Alpine, 2s. 6d. per packet. Stage, 2s. 6d. and 5s. per packet. PRIMULAS, each colour, 1s. and 2s. 6d. per packet. CINCERARIA, 1s. and 2s. 6d. per packet. COCKSCOMB, extra grand competition strain, 2s. 6d. per pkt. BEGONIAS, Single, 1s. 6d.; ditto double, 2s. 6d. per packet.

MR. ANDERSON, The Gardens, Abbotree, writes:—"You will be pleased to hear that your seeds have done so well that I have not one single failure."

HARTLAND'S GOLDEN QUILLED SUNFLOWER, "SOLEIL D'OR"

WILLIAM BAYLOR HARTLAND submits the following relative to the merits of this plant. He has no other means than with such testimony of adding force to what has already been written on the subject. There is no doubt the Irish variety is quite distinct from that known in England, and he is sincerely obliged to Messrs. Pearson, Backhouse, Payne, and Cullingford for what they have written him on the subject.

*. * Strong Plants (Orders now in strict rotation), 12s. per dozen; 1s. 3d. each.

Dozen lots post-free.
Single plants 3d. extra for postage.
Trade Terms on application.

"Your Soleil d'Or Sunflower is certainly perfectly distinct from the ordinary form grown in this country, and is, we think, rather richer in colour. It will be a decided acquisition to our English gardens.

"A. AND C. PEARSON,
"Chilwell Nurseries, Notts."

"We like your Soleil d'Or Sunflower very much. It is now in flower, much in advance of the ordinary form.

"JAMES BACKHOUSE AND SONS,
"Nurseries, York."

"Your box of Soleil d'Or Sunflower blooms to hand. I am much obliged for your sending them. Several of the blooms are much finer than the drawing or illustration you publish, and they form a really attractive and agreeable vaseful.

"C. HARMAN PAYNE,
"Thorn Road, South Lambeth, London, S.W."

"Dear Mr. Hartland, - I am writing to tell you how very pleased I am with your quilled barbeous Sunflower. I have grown nearly all the varieties of Sunflowers for many years, but of all the double flowers I consider this the very best.—Yours truly,

"W. H. CULLINGFORD,
"Earl's Court, Tunbridge Wells, London."

*. * The plant has also been sent to Kew and Chiswick Gardens for trial, and **PRONOUNCED QUITE DISTINCT.**

*. * Year Book of Seeds for 1890, now ready.

SATURDAY, FEBRUARY 8, 1890.

HORTICULTURE AT VERRIERES.

NUMBERS of persons in this country, connected with horticulture and agriculture, rejoice in the acquaintance of M. H. L. de Vilmorin, a frequent visitor amongst us, and almost a native in his command of our language. Those who do not know M. Vilmorin will still be glad to hear something of the famous farms and trial grounds of the oldest firm of seedsmen in the world, and one of the most extensive.

My special mission in paying a visit of two days to Verrières, a village 10 miles due south of Paris, where the trial grounds are situated, was to examine the collection of different varieties of Wheat which, on July 22, were "dead ripe." Perhaps I may mention incidentally that M. Vilmorin is the author of a very handsome illustrated quarto volume, entitled *Les Meilleurs Blés*, in which all the best sorts of wheat known in European agriculture are accurately described, and the ears and grains beautifully illustrated. From 100 to 500 plots of wheat are grown at Verrières, side by side, including sorts from all parts of the world, which are here compared with one another, and their respective merits and demerits demonstrated, and the numerous synonyms among the so-called varieties discovered.

On arrival, I found M. Vilmorin among some rows of peas, with a plant in his hand, which he was closely examining, and at the same time dictating to an amanuensis a minute description of it. All or most of the incomparable Peas grown in England were there, and all would be subjected to the same close scrutiny. The best Wheats were subjected to the same process, and the result has been that M. Vilmorin has been able to compile the most complete book that has yet appeared on the subject. English farmers, knowing, as most of them do, only about half-a-dozen different sorts of Wheat, would be astonished at the accuracy with which they are all described in *Les Meilleurs Blés*, both as regards their appearance, length, and abundance of straw, &c.; and their special characteristics and

LILIUM AURATUM.

In finest possible condition, hard as bricks!
Order early.

FINE BULBS, measuring 8 inches round, 25 for 6s. 6d., 100 for 21s.
" 9 to 9½ inches round, 12 for 5s., 100 for 18s.
" 10 to 10½ inches round, 12 for 7s. 6d., 100 for 50s.

Better Bulbs impossible. Special Trade Prices.

AMERICAN "PEARL" TUBEROSES, just arrived, 12s. 6d. per 100.
GLADIOLUS COLVILLEI ALBA "THE BRIDE," 6s. 6d. per 100.

" BRENCHELEYENSIS, scarlet, 3s. 6d. 100.
LILIUM RUBRUM CRUENTUM, very dark form, immense Japanese bulbs, 1s. each, 100 dozen.

" ALBUM KLETZERI, pure white, 12s. doz.
" WASHINGTONIANUM ("alfonian Silver Lily), gigantic bulbs, 22s. per dozen.

" PUMPHREYI, gigantic bulbs, 22s. per doz.
" PARDALINUM "MICHAUXII, large clumps, 2s. 6d. and 3s. 6d. each, low prices.

Finest obtainable quality, at very low prices.

SEED POTATOS.

To Grow in GARDEN or FIELD, or for EXHIBITION.
THE REAL WHITE ELEPHANT.

A White Elephant Potato with a pure white skin—a great improvement on the old variety. Grand Market or Exhibition sort. Send for Descriptive CATALOGUE, the most complete in the Trade, containing description of most sorts worth growing. J. WATKINS, Potato Grower, POMONA FARM, WITHINGTON, HEREFORD.

value, and the sorts of soils which suit them; for there is no best Wheat for all soils and climates, or one pre-eminent sort would suffice, whereas we have at least three or four score, red and white, long and short, bearded or headless, coarse for indifferent situations, or refined for the finest Wheat soils.

The farms at Verrières have been for forty years past used by the firm of Messrs. Vilmorin, Andrieux & Co. as a site for the preservation of old varieties of plants, and for the production and trial of new varieties. The experimental grounds comprise each year about 25,000 plots. As in the case of our own leading seedsmen, these different divisions are applied to the growth of stock seed for distribution among the growers of the firm; to the cultivation of seeds delivered by the growers so as to subject the produce to the test of comparison; to the trial of novelties introduced by other seedsmen, as in the case of the new Peas I mentioned just now; and to the preservation of a number of typical examples to serve for comparison in the work of keeping old sorts true, and in introducing new varieties. It needs but little reflection to comprehend that a vast amount of work is entailed upon the firm and its experts in carrying into effect the various objects thus described. There are compartments for all the principal productions: for flowers of various kinds; for Mangold (the seed of which is sold by this firm to the extent of two to three million pounds annually); for Potatoes, forage plants, Peas and "Haricots;" and, in fact, for everything. And at the farm of St. Fiacre, where some fine ranges of sheds and floors have been erected for dealing with the ripe seeds and for storage, the patron saint of gardeners' figures above the chief entrance, and seems appropriately to preside over the industry of this great establishment.

The land in the immediate neighbourhood of Verrières is fertile, and in driving from the railway station at Massy I noticed that it was chiefly devoted to the growth of vegetables for the Paris markets. This kind of cultivation is more profitable than the growth of seeds, and M. Vilmorin's neighbours do not, in fact, grow any, so that his choice stocks of various kinds—which, no doubt repay him the extra cost of their production—run no risk of becoming contaminated by intermixture with common sorts. Perhaps I may turn aside here to mention that I happened to be at Verrières on the annual *fête* day, and M. Vilmorin being the mayor, I had the pleasure of hearing his address to the people, delivered in a tent where, with the assistance of the clergyman and two or three other gentlemen, he distributed a large number of handsome books as prizes to as bright-looking a lot of village school-children as I have ever seen. There was quite a crowd of small landowners present, and they all looked smart and well-to-do. The ceremony was not of long duration, and at its close we passed among the roundabouts, fancy stalls, and shooting galleries, and then returned to our *betteraves*, &c. But, if I may tell the story, my accomplished guide and host, being invited as the mayor to show his skill, smashed three revolving eggs with a pea-rifle very neatly, and then we retired in triumph.

As to the *betteraves*, or Sugar Beets, it is a great mistake, growing them too large, inasmuch as the smaller ones contain a far larger percentage of sugar. The same rule applies to Mangold Wurzel for cattle, which ought never to be grown in rows much more than 27 inches apart, except for the purpose of cleaning fowl land. The crop should consist of many and small,

rather than few and large. And yet, such is the popular ignorance, that growers sometimes throw it in the seed merchants' teeth that his *betteraves à sucre* (for this can surely only occur in France) are not of the giant or mammoth breed.

I saw Onions growing in very many plots. The Potatoes are a fine collection, to which, in fact, all the novelties are added every year. The practice here is to select the best from all the sorts here tried and tested, and not to breed any. Some are grown for trial, and some—previously approved of—are grown for seed, *i.e.*, sets, to be sent to growers.

In England a potato merchant will look at no tuber which has not white flesh, and strange grimaces would be made at the Criterion or Holborn restaurants—these busy feeding places—if yellow-fleshed Potatoes were served at dinner. In France it is the other way; bright yellow is the approved colour, and in one of his frequent visits to England M. Vilmorin met with the very early yellow-fleshed Potato, Victor, an earlier variety than the Ashleaf, and found no difficulty in transferring it to France, where it has been a great favourite.

We next observed a collection of Gourds and the Custard Marrow, which, when true, grows in a clump, and does not "run." The blossoms are artificially impregnated, and to keep them true, are confined in such a bag as Grapes are secured in sometimes to baffle wasps and flies. French Beans and Gerkins came next, and then Scarlet Runners—red, white, and bi-colored; and a Lina Runner, and a late Bulgarian sort, named Southern Prolific, with dark-coloured, purple flowers. We passed the ground where the Peas had been harvested, and the dwarf beans. The green-seeded French Beans, which are so much in fashion in France, are obtained in this way: the haulm is pulled up before the seeds are ripe, and put into heaps, with a covering of straw to preserve them from the weather. The Beans so treated, when shelled and boiled, preserve their green colour.

The trade in these green French Beans has become a very large one around Paris and elsewhere. Soja hispida, or Dolichos soja, the Soy Bean, is represented here. It is grown for fodder and for ploughing in green as manure, and is of little value in France, it ripening too late, if at all. But it is one of the great food plants of the world, a native of Japan, De Candolle says, and used in that country and in China from remotest antiquity. The Bean contains a large proportion of oil, and preparations similar to butter and cheese, and oil, are obtained from it in the cookery of the East.

Flowers innumerable are grown in the grounds, of various kinds for the production of stock, seed, and with the other objects already noticed. I observed an exquisite light blue Delphinium, which was raised here; charming rose-coloured sweet Peas; Gladioli; Phlox Drummondii fimbriata, the blossoms fringed and pointed—an innovation, not an improvement; Italian Verbena, striped. But we had little time among the flowers, and left them for another occasion, my pencil having been mainly occupied among the varieties of Wheat, hybrids, cross-breeds and pure-breeds. H. E.

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM "NORTHUMBRIAN"
(*new hybrid*).

This new hybrid has been raised by Mr. Drewett O. Drewett, of Riding Mill-on-Tyne, from seeds of C. calophyllum, fertilised by the pollen of C. insigne var. Maulei. It belongs to the same group

as C. Ashburtonia, C. Crossianum, and C. obscurum, and is of about equal merit with those plants from a decorative point of view. The leaf is similar to that of C. insigne in shape, but it is indistinctly marbled with dark nerves and cross veins. The peduncle is 7 or 8 inches long, brownish-purple, and pubescent. The bract is similar to that of C. insigne, about 1½ inch long, convolute in the lower part, dull green, suffused and dusted with dull purple. The ovary is about twice as long as the bract, entirely of a dark purple colour, and softly pubescent. The upper sepal is almost exactly elliptic, being broadest at the middle, and nearly equally narrowing at both ends, sub-acute, nearly 2½ inches long by 1½ inch broad, pubescent on the back; the basal and central area is light apple-green, well covered with small brownish-purple spots, and the apical third and the broad borders are pure white and unspotted; the nerves are numerous and closely set, and neither very prominent or strongly coloured. The lower sepal is oblong-acute, pale green, spotted with brownish-purple at the base. The petals are similar to those of C. Crossianum, but are a little paler, and not so spotted, they are light brownish-purple, fading into purplish-ochreous at the tips, and with the nerves and indistinct cross-veins rather darker; the base is yellow-green, with a basal tuft of purple-brown hairs, and the way edges are ciliate, with fine purple hairs. The lip is pointed, and somewhat like that of C. insigne in form, shining, and of a light brownish-purple colour, the indexed sides of the claw being ochreous, with a faint purplish tinge, and dotted with purple. The staminode is broadly obovate, with a short tooth in the notch, having a ridge-like tubercle in front; the colour is pale purplish. Of the hybrids allied to it, C. Crossianum comes nearest, but the upper sepal of that flower is broadest towards the base, and the lip is not pointed. The broad ovate form and dark green prominent nerves of the upper sepal, and wart-spots of the sepals of C. calophyllum, its mother parent, have entirely disappeared in the hybrid, and if its parentage was not certain, no one would probably have guessed that C. calophyllum was one of its parents. It only shows how unwise it is to attempt to assign parentage to supposed hybrids, without certain knowledge of their origin. Mr. Drewett has, however, ingeniously stated, that it is just such a hybrid as one might expect to obtain from a cross made between C. Crossianum and C. Ashburtonia. These two plants are the issue of four parents, thus:—

$$\begin{aligned} C. \text{ Crossianum} &= \begin{cases} C. \text{ insigne.} \\ C. \text{ venustum.} \end{cases} \\ C. \text{ Ashburtonia} &= \begin{cases} C. \text{ insigne.} \\ C. \text{ barbatum.} \end{cases} \end{aligned}$$

If we assign the fractional value of half to each of the four parents of these two hybrids, then to the elements of a hybrid raised between C. Crossianum and C. Ashburtonia, we should assign half that fractional value, or one quarter; such a hybrid would therefore be compounded of the elements:—

$$\begin{aligned} C. \text{ insigne, } \frac{1}{4} &= \frac{1}{4} \\ C. \text{ venustum, } \frac{1}{4} &= \frac{1}{4} \\ C. \text{ barbatum, } \frac{1}{4} &= \frac{1}{4} \end{aligned}$$

And this new hybrid "Northumbrian" has the same combination in the same proportions, thus:—

$$\begin{aligned} C. \text{ "North-umbrian"} &= \begin{cases} C. \text{ calophyllum} = \begin{cases} C. \text{ barbatum, } \frac{1}{4} \\ C. \text{ venustum, } \frac{1}{4} \end{cases} \\ C. \text{ insigne (Maulei)} = \dots \dots \dots \frac{1}{4} \end{cases} \end{aligned}$$

But so curious are the ways of Nature, that it by no means follows that a plant just like C. "Northumbrian" would be obtained by crossing C. Crossianum and C. Ashburtonia; however, it would be very interesting, from a scientific point of view, if some one would make the experiment. N. E. Brown, *Herbarium, &c.*

CYPRIPEDIUM LREANUM VAR. BIFLORUM, *new var.*

Mr. D. O. Drewett, of Riding Mill-on-Tyne, has sent to Kew a very handsome form of this plant, which shows a decided tendency to produce two flowers on a scape, though, as is also the case with C. bar-

batum var. biflorum, the peduncles are not always two-flowered, but when one-flowered, seems recognisable from the two other forms of the plant, by the large development of the secondary bract. The upper sepal is large and full, and well marked with purple spots, and the whole flower is brightly coloured. The peduncle seems also to be rather longer than usual. The parents of this form are *C. insigne* var. *Chantini*, seed parent, and *C. Spicerianum*, pollen parent. *N. E. Brown, Kew.*

CYRIPEDIUM SIAMENSE, n. sp.

This is a new and pretty *Cyripedium*, imported from the neighbourhood of Bangkok, in Siam, of which a leaf and flower have just been received from Mons. J. Garden, Horticulteur, Bois-Colombes, near Paris, for description. It belongs to the group with tessellated leaves, and apparently stands nearest to *C. javanicum*, Reinw. The leaf is linear-

spots and warts. Staminate horse-shoe shaped, with a notch in the basal and a small tooth in the apical side, the margin of a pale purplish colour, and the centre with numerous dark green nerves. I understand that it is to be sent out this spring, and no doubt it will be welcomed by cultivators of this interesting genus. *R. A. Rolfe.*

LOCKINGE.

On October 12 last year we published in these columns an account of the gardens at Lockinge, made famous in these days by Lord Wantage. Since the publication of that paper we afforded our readers, on January 11, a view of the conservatory, flower garden, and church; and we now give a view of the rock garden, and a bridge over the neighbouring stream (fig. 26), and another (fig. 27), of the same stream a little distance away from the rockery.

gardening, or that supplied through the medium of the horticultural press, which was always welcome, seeing that it contained the most recent cuttings from the head-quarters of horticulture. Who, then, can say that horticulture is made up of unwritten traditions? There are hundreds of establishments throughout the country where the knowledge of gardening to be obtained is of the most rudimentary kind, if entire dependence is to be placed on what is to be obtained from the verbal instructions of the chief. Even in large establishments, young men yearning for a knowledge of their profession, must glean it from various sources written and recorded. To ignore these facts is to ignore the valuable assistance given to horticulture by such men as Miller, London, Thompson, Lindley, Thomas Moore, and many others, including living writers.

Much is written about imitating Nature, but I fear that many of her works are inimitable in many

FIG. 26.—ROCKERY AND RUSTIC BRIDGE OVER A STREAM IN THE GARDENS, LOCKINGE.

oblong, 6 inches long, $1\frac{1}{2}$ inch broad, grey-green, somewhat glaucous above, and tessellated with dark green nerves, very glaucous below. Scape 14 inches high, dark purple-brown, pubescent. Bract acute, 1 inch long. Ovary $2\frac{3}{4}$ inches, purple-brown. Dorsal sepal broadly ovate, acute, $1\frac{1}{2}$ inch long; light green in the centre and base, passing into light purple, and thence into a broad white margin; the nerves dark green, seventeen in number; and the margin reflexed. Lower sepal smaller, narrower, pale green, with six darker nerves. Petals ligulate, slightly deflexed, $2\frac{1}{2}$ inches long, 8 lines broad, ciliate; light green, with twelve darker nerves, with about six blackish warts on upper margin, the distal third passing into pale purple. The lip 2 inches long, the pouch ellipsoidal, sub-compressed, pallid behind and at apex, with small dusky spots, purple-brown in front, the infolded basal lobes meeting at their edge, pale whitish-green, with numerous small and a few larger purple-brown

The stream has been very successfully dealt with by the garden artist, and exhibits so little obtrusion of art, that it is quite a charming feature of the garden. The rockery is not a very pretentious thing, but it is natural, and well adapted to the growth and to the display of the plants with which it is furnished.

A GARDENERS' PROBLEM.

HORTICULTURE (p. 116) is said to be "built up of traditions"—which means, I presume, that the opinions and practices relating to horticulture have been handed down to posterity unwritten. I, like many others, have scaled the horticultural ladder, or passed through the routine of gardening, in the usual way; but from the very commencement I had to call in the aid of the written history of the profession, in the shape of good standard words on

parts of the globe, the British Isles included. How can we imitate, in the confined limits of a greenhouse, or on pigmy mounds of earth called rockeries, what Nature requires a continent or a mountain, with their attendant climatic conditions of heat, light, and moisture, to effect? The history of *Gentians*, *Primulas*, *Saxifragas*, the *Narras*, and others, in gardens, all testify to what I mean. Who has not often been shocked by the burlesques on Nature in what are termed natural rockeries, grottos, and caves, especially as aids to plant culture? Man constructs these paltry imitations often without considering how the plants will be able to obtain light or water absolutely necessary for their existence. The grottos and caves are planted, and the subjects left pretty much to take care of themselves, and the gardener then wonders why they die. Illustrations of this may be seen in many otherwise good horticultural establishments. Nature builds rocks in a

natural way, and then sows them broadcast with seeds of all kinds, and those grow which find the conditions suitable, including, it may be, an underground supply of moisture. In this, if I may be allowed the use of the expression, Nature may be described as empirical. A life-and-death competition amongst the plants themselves determines which will survive. Something similar may be seen in many hothouses, where the desire seems to be to crowd as many plants of different kinds as possible into a given space, utterly regardless of the fact that one-half is killing the other by overcrowding and want of light. Here a knowledge of that branch of botany, known as physiology, would be of immense advantage to the gardener, or those responsible for the medley in question.

Referring to the test plants mentioned by Mr. Watson at Kew, it is no doubt a clerical error (p. 117), which makes him say that the *Narras* (*Acanthosicyos horridus*), *Welwitschia mirabilis*, *Macuna macrobotrys*, and *Camœnia maxima*, have been flowered at Kew. The flowering of most, or all of them, in Europe is still an accomplishment to be hoped for. It is true that the experiments have, so far, succeeded, but here the record terminates. Concerning the difficulty with *Camœnia maxima*, I once got into hot water by describing the plant as a fine thing; and so it is if it could be flowered. "Is that the fine thing you spoke of?" exclaimed an enraged horticulturist, pointing to a miserable dwindling thing, with one or two leaves. *Welwitschia mirabilis* and the *Narras* are still in their infancy; and the planting of them in sand, or sandy soil and brick rubble, may surely be described as an attempt to imitate Nature. In the case of the former, if experiments are carefully conducted, and varied according to the increasing requirements of the plants for the next fifty years or more, the *Welwitschia* may be expected to flower. The operation of repeating may prove to be a risky one.

Detailed information concerning the conditions under which the *Narras* is found in a state of Nature, is recorded in the *Gardeners' Chronicle* for April 3, 1886, p. 456, and need not be repeated here. A description of the plant, at p. 721, same volume, was furnished by Mr. Ch. Naudin, Antibes, but after describing the plant in its native habitat, as he was informed through Père Duparquet, a French missionary, who resided in Dammará Land, he did not say that the conditions could be successfully imitated in the British Isles. He merely suggested that it might be cultivated in the sands of Egypt, in the Sahara, or in some country presenting the same or similar climatal conditions. The *Narras* flourishes in sand without any rain, but it must have moisture, and sends out roots of enormous length in quest of it. One of these, as measured by M. Duparquet, was over 325 feet long! Can those conditions be imitated at Kew? The arid atmosphere and the intense light in Dammará Land are here wanting. The flowering of this plant, yet in its infancy, is a problem to be solved, but the fruiting of it is a greater, and until that can be accomplished, as in the case of Melons and Cucumbers, horticulture cannot be said to have triumphed. A study of the morphology and physiology of the plant shows what an achievement Nature in her slow but sure way has accomplished in changing a leafy, climbing, Cucumber-like plant into a spiky, erect, leafless subject, capable of producing 200 fruits on a single individual on the rolling sand dunes of Dammará Land. Reproduction chiefly or solely by seeds is Nature's great aim, as has been well stated by Mr. Burbidge (p. 72), and in this she succeeds.

Again, the condition of plants in a state of Nature is not always a sure guide of what they are capable of doing if sown or planted in rich soil or protected from competition, as they are by horticulture or agriculture. Cabbages, Turnips, Potatoes, cereals, Peas and Beans, are all good examples. *Primula sinensis* found in the dry ledges of limestone rocks in China is another. In this country when trees have been cut down, copsewood destroyed, or the taller herbage destroyed by fire accidentally or other-

wise, various choice wild plants that had previously been ousted by competition spring up, including *Paris quadrifolia*, *Polygonatum*, *Orchis maculata*, *Trollius europæus*, and many others. It is frequently stated that our native Orchids require limestone for their successful cultivation, yet hundreds of them die in gardens, old mortar and brick rubble notwithstanding. I have seen *Orchis maculata*, *O. latifolia*, and others in a wild state, making growths from 18 inches to 3 feet in height, where there was no lime in any appreciable quantity in the soil. *Armeria maritima* is a seaside plant, as stated by Mr. Watson, but it also occurs on mountains in the Highlands at an elevation of 3800 feet. I have dried specimens about 3 inches in length from the rocky coast of South Wales, and others 10 inches and 12 inches long from Rothiemurchus, in Inverness-shire, where the plants were growing amongst rank sphagnum, associated with *Drosera*, *Narthecium*, and *Polytrichum*.

Amongst Orchids in gardens, Nature must still be allowed her own way with *Scuticaria Steeli*, *Oncidium Jonesianum*, *Cattleya citrina*, and others of that class which will persist in growing head downwards. Notwithstanding statements to the contrary, there are Orchid growers in this country who pursue the study of botany in several of its many branches, and succeed in the culture of their favourites. I recently listened to a very instructive paper on Orchids by Mr. Swan, who trenchanted deeply into the domain of botany both from a morphological and physiological point of view, and who afterwards answered many questions relating to the same. In answer to the question as to whether Orchids should be potted high or low, he instanced *Calanthe*, *Phaius*, and *Cypripediums* as kinds requiring to be placed deeply in the pots, whereas *Cattleyas* should be well raised above the surface. Herein we have a good cultivator advocating an imitation of Nature in treating terrestrial and epiphytal Orchids as such respectively. Although the roots of *Cattleyas* dip downwards into the soil, they bend out again directly, and grow down the outer surface of the pots. The chlorophyll developed in the roots of many epiphytal Orchids should teach the most sceptical horticulturist that Nature meant it to be exposed to light. I have seen *Phalenopsis Schilleriana* grown in small baskets producing panicles of bloom 3 feet in length, and the roots of those same plants were plunged, baskets and all, into large wooden cylinders filled with sphagnum. What was the result? The plants either died outright, or grew beautifully smaller at an alarming rate.

The enormous number of Orchids which have been killed annually for years past by the untutored or experimenting horticulturist cannot be conceived. The same might be said of *Lilium auratum* and other species. Auriculas have also been martyred by ingenious compounds of bullocks' blood, sugar-bakers' scum, night-soil, fuller's earth, &c.; but the florist is coming to his senses, and believes in the use of simpler and more natural composts, consisting chiefly of good loam. All these are not traditions, but have been recorded for the guidance of the younger members of the profession, who, indeed, have to learn the whole subject afresh, but are enabled to leap up by starts and bounds upon the ladder prepared for them by a long array of workers in the field, both gardeners and botanists.

There has been much wrangling over the words botany and botanist. The former originally meant plants for fodder, although it now applies to the science that treats of plants. It is questioned whether Linnaeus, who has justly been termed the father of botany, would in his day have regarded phyto-physiology as having any connection with botany. Notwithstanding this, there can be little question that systematic, economic, and geographical botany, together with morphology, physiology, horticulture, agriculture, and everything dealing with plant uses, culture, and nomenclature, are all branches of one comprehensive whole. Each of these branches requires the whole time and attention of an individual, if he desires to excel, so that

we have a division of labour, all tending to benefit and improve the whole. The objects of the one are not antagonistic to that of another. There is no reason why a man with a considerable amount of botanical knowledge should not be a good gardener if he chooses, and there are many such. No reasonable man would think of taking a botanist from the herbarium, a physiologist from the laboratory, or a museum curator to cultivate living plants, more especially if their experience has been solely acquired in those places. Horticulture does nevertheless frequently apply to such for information or assistance on various matters relating to horticulture. Geographical botany does also lend material assistance to a gardener in enabling him to locate his plant in the garden; and the conditions under which a plant is found in Nature will often prove a correct guide to follow, if possible, of approximately exact imitation. What we want is careful observers to correctly record the conditions. *J. Fraser, Kew.*

— As far as this question concerns the cultivation of hardy plants in the open air, perhaps I may be allowed to say a few words. It is asserted on the one hand that we often find plants in cultivation thriving better than they do in their native homes, and at the same time under very different conditions from those which they seem to prefer when wild. On the other hand, it is said that when we get a plant that is new to cultivation, we should try to imitate as nearly as possible the conditions, if we know them, under which the wild plant has been seen thriving. Both these statements are quite true. We cannot without experience determine which of the conditions are essential to the plants' well being, and which are accidental, but we find out this gradually by experience, and then by paying attention to the essential points, the gardener may improve upon Nature. But there can be little doubt that a gardener who commences his treatment with a knowledge of natural conditions has a great advantage over one who begins his work in the dark, though both may arrive in time at the same result.

Where a plant is seen thriving permanently, we may be sure that it has all that is essential to its welfare, and any one who can imitate exactly all the conditions under which the plant thrives is sure to succeed. There may be some conditions which are entirely superfluous, and might as well have been neglected; and there may be, and too often are, others which are entirely beyond human control, such as those of climate or atmosphere. Thus, many plants which can endure 70° of frost in winter, die out gradually in English gardens for want of sufficient sun-heat in summer, though they may seem to do well for a few seasons. This happens to some North American plants. Others, natives of the Alps and Pyrenees, and particularly of the Himalayan temperate regions, will not do well without an atmosphere nearly saturated with invisible moisture through the summer, and are withered by an English sun in June and July. South American subjects are still more intractable, refusing to be satisfied with any conditions our little island can afford, and remain permanently milky and unsatisfactory, like *Senecio pulcher* and *Onrisia coccinea*. Again, to satisfy the natural conditions under which hardy Japanese and Chinese plants grow, we must eliminate that inevitable factor of an English spring, the blasting east wind. Our "spirantes frigora Contrit cut back the spring growth of such plants as *Dicentra spectabilis* until they are worn out. These are a few cases of conditions beyond our control.

The cultivation of British alpine and maritime plants, of which I have had long experience, presents some curious puzzles and paradoxes. For example, of two Saxifrages, *S. aizoides*, and *S. stellaris*, one is abundant on the mountains of the Lake district, the other on those of North Wales, and they seem to grow under precisely the same conditions in trickling watercourses, and in *debris* of similar geological character. *S. aizoides* may be cultivated permanently and easily on any part of an elevated rockery, but *S. stellaris* will not grow at all here.

In the case of seaside plants, deep warm sand seems essential to some, and salt to others. *Glaucium luteum*, *Frankenia levis*, *Convolvulus Soldanella*, *Eryngium maritimum*, and others, grow luxuriantly for a time in ordinary garden soil, but they gradually degenerate, and flower badly. *Aster trifolium* dies out soon. *Mertensia maritima* is a study in itself. Here I supply it liberally with salt, and it thrives; being a northern plant I cannot understand why it does well in the hot dry black soil at Munstead in Surrey. There is one plant which certainly seems to bear out the theory of those who contend that natural conditions matter little. It is *Senecio spathulifolius*; I got this ten years ago from the storm-beaten rock near the South Stack lighthouse at Holyhead, which is, I believe, its only British habitat. Seeds of it come up wherever they fall in my garden; and are weeded up by hundreds; those that are left flower well, and in several generations

simple contrivances are fitted up instead, which give a fair measure of success when the first principles of the art are understood. Beginners in the art seem to have an idea that a great degree of heat is required, especially bottom-heat, which is by no means always the case, and which is, of course, needless with most greenhouse plants; and even in the case of tropical things I have had the most success when heat was used in moderation. Bottom-heat, if it be strong, has a tendency to promote decay rather than the formation of roots; at all events, that is the case with hard-wooded plants. A high temperature in some cases will even retard the germination of seeds. What is of more importance than special structures or great heat, is, intelligent and unremitting attention on the part of the operator, want of success being more often attributable to neglect than any other cause. If a cutting be allowed to flag, it has parted with moisture which, in its rootless con-

dition, can only replenish with difficulty; and should this flaccid condition be often repeated, or long continued, failure is likely to result, for a cutting cannot form roots unless its cells are in a fairly turgescence condition. Consequently, means must be taken to maintain this condition in the cutting, by surrounding it with a genial moist atmosphere, being careful, however, not to keep the air around the cutting in a saturated condition, as this would set up a kind of fermentation of its juices, and induce decay. The usual and the most satisfactory method of accomplishing this is, by placing the cuttings in a small garden-frame or hand-light, in a house of the required temperature; indeed, frames are usually employed in propagating-houses, as they can be aired or closed as may be required, and fluctuations of all kinds are more easily guarded against. In choosing a position for the frame, it should be such as will admit the maximum amount

of light, but not direct sunshine; and it should preferably face the north, less shading being then required. If the position will admit of it, a bed of mild fermenting materials may be used, such as spent tanner's bark, clean Oak leaves, or Cocoa-fibre refuse; but the last will be found of more use to plunge the cutting pots into, or to dibble the cuttings into if pots be not employed; besides, by damping it moderately before inserting the cuttings it will keep up the necessary humidity without much future watering being called for. Sufficient time should be given, after putting the Cocoa-fibre into the box, to allow of its getting as warm as the temperature of the house, before placing the cuttings in it. In such a frame, and without bottom-heat, I have struck all sorts of tropical subjects in midwinter, with a very small percentage of loss; indeed, I consider this season of the year the most favourable for propagating tropical plants; the

FIG. 27.—A PART OF THE STREAM IN THE GARDENS, LOCKRIDGE.

the plant does not seem to have undergone the least change. It has been suggested that it is a moribund species; be this as it may, it retains a wonderful constitution. *C. Welley Dod, Edge Hall, Malpas.*

PROPAGATION.

In all well-regulated gardens the reproduction of plants occupies a first place, and is going on more or less the whole year, according to the requirements of the establishment; indeed, the natural order of things renders it imperative, and more particularly so with plants which are grown under glass, and which are always living in an artificial medium, and under relatively unhealthy conditions. In many gardens there are structures provided, which render plant propagation comparatively easy; still gardens may be found which are destitute of these aids, and some

wood being then in a fairly mature condition, little active growth is taking place, and the sun having less injurious effect on them at that time, admits of more exposure to the light, which is an important factor, as cuttings much shaded are apt to lose their leaves, which should never be permitted. It is a good practice to tie up the foliage to a small stake, and this has two advantages—the leaves are not so liable to suffer through the cooling effect of radiation, nor are they so likely to get injured by the necessary handling, or to damp off, as would be the case if they were crowded together, or laying on the plunging material. As to whether the cuttings should be potted at once, or dibbled in the bed until rooted, or several inserted round the edges of a pot, will, in a large measure, depend on the species of plant; but generally, it is time saved to pot them singly into the pots—when large pieces are used—as less check to growth takes place when they are

as less check to growth takes place when they are

potted. For Crotons, Acalyphas, Dieffenbachia tops, Cyanophyllums, and many similar things I have found the one cutting in a small pot to answer the best. And next to that, is the method of putting several round the sides of small pots, and which when rooted, may generally be separated with a small ball of soil. When repotting or moving them from the cutting frame, they should for a few days previously be afforded more air, as any sudden change is prejudicial to such tender things. It is in the unremitting attention paid to small details, that the chief secret of success lies. *F. R.*

ORCHID NOTES AND GLEANINGS.

THE CYMBIDIUMS.

THESE are very choice members of the great Orchid family, and are much valued in all gardens when well cultivated. I would not at this time have ventured to offer a few hints on their culture had I not seen recently some members of the genus in rather a sorry plight owing to bad management. One may well ask why is the beautiful *C. eburneum* to be seen sometimes in a healthy, vigorous condition, in a collection of ordinary stove plants, and in poor condition in a fairly well grown Orchid collection? The reason is obvious when one comes to examine the conditions of culture. The *Cymbidium* is to the person in charge, an Orchid to be treated the same as *Laelia purpurata* or *Cattleya Mossie*. The pots are filled about half full of drainage, and a compound is used for them of fibrous peat, sphagnum moss, potsherds, and charcoal. Many persons seem to get into a regular routine system of culture, and cannot deviate much to the right hand or the left, when it is absolutely necessary to do so. *Cymbidium eburneum* is the best known species in the genus, and is much valued for its large ivory white flowers, and strong perfume which is not pleasing to every one. The editor of the *Botanical Magazine* described it as having a smell of starch. It has been introduced into England at least forty-three years, for it was figured in the *Botanical Register* in 1847. Its discoverer, Mr. Griffiths, does not give any information of the conditions under which it was discovered, except that it was found at Myrang, on the Khasia Mountains of East-Bengal, at an elevation of about 5000 or 6000 feet. The appearance of the roots, when the plants have been newly imported, are suggestive of swampy ground; and indeed the plants grow freely, and flower well in turfy loam; a little fibrous peat may be added, and a sprinkling of rough white sand, and leaf-mould in the proportion of a fourth part of the whole-bulk may be added. Large specimens may be repotted once in two years. The plants, coming from such a great elevation, do not require a high temperature; a shady position in the Cattleya-house suits them best. Our largest plant of *C. eburneum* is about twenty years old, it is in vigorous health, and last year produced twenty-seven flowers. *C. Dayanum* seems to be a form of this species, with the lip spotted and streaked less or more of a blood colour.

C. Parishii is a lovely species, distinct from *C. eburneum* in its broader leaves, and the lip spotted with crimson. *C. Mastersii* may also be brought into this group, it is a more elegant plant than either of those named above; the leaves are narrow, and recurved gracefully, the flowers pure white, the lip lightly spotted rosy-purple, and Almond-scented. We have in our small collection a pure white variety.

C. Lowianum belongs to quite a distinct group from the above, the plants being of the most vigorous habit. We have one that two men can move only with difficulty, which five years ago was quite a small specimen in a 5-inch pot; such large plants are well adapted to fill up the centre stage in large houses. This species, and the group to which it belongs, have roots that seem better adapted to seek their food in a ditch than elsewhere; even the appearance of the

plants with their long linear leaves suggest this. They are potted in loam, leaf-mould, and manure, luxuriating with a goodly supply of water during the growing season, and should not to be allowed to become dry at the roots in winter. Some varieties of this species have bright-coloured flowers, and as they are produced thirty or more of them on a raceme 4 and even 5 feet in length, they have an imposing effect; another point in their favour, is their long lasting character—for with care, they will remain in good condition for three months or more.

C. giganteum, a noble growing species, was little known or cared for until *C. Lowianum* appeared. They are much alike in their habit of growth, requiring similar treatment, and the flowers resemble each other, except that the labellum of *C. giganteum* is of a bright yellow colour, thickly blotched and spotted with blood red; the flower-scape is shorter, and formed of fewer flowers, which are produced in the late autumn months, whereas those of *C. Lowianum* are produced in the spring and summer.

C. Hookerianum is also a noble species of the same group, which I have not seen in flower in a living state. Dr. Hooker found it growing in the Sikkim Himalayas, where it was also found by Mr. Lobb, who sent it to the Exeter nurseries of Messrs. Veitch, but the plants were grown too warm, and in other respects badly treated, so that it did not flower freely. It is evidently very near to *C. giganteum*. *J. Douglas.*

ODONTOGLOSSUM ROSSII MAJUS, PALE VARIETY.

THE FORMS of *Rossii majus* are numerous, and the colours varied. This one, in the collection of Mr. A. Heimes, Fallowfield, near Manchester, has very distinct sepaline segments, spotted with the palest possible shade of sienna, and the spots very decided and distinct, looking all the better on being placed on a whitish ground. The petals are white, with a few sienna blotches at base; the lip is white, with a yellowish crest, and the whole flower distinct, and worthy of cultivation. It is suspended in the usual way, and is grown well by Mr. Craggs.

DENDROBIUM HETEROCARPUM × FINDLEYANUM.

THIS form has a good deal of the combined blood of the parents. The flower is more like *D. heterocarpum*, having the fragrance of that excellent and distinct species, possibly a little removed. We would say it was an admixture of *Vanilla* and *Heliotrope*. Its petals and sepals are more elongated than even those of *heterocarpum*, and are nearly uniform. The keel holding the enveloped column is very prominent; the labellum is also more elongated than the female parent, being prominently acuminate, and having multitudinous fine hairs on a nankeen ground. It is very floriferous, and is dwarfed growing than either of its parents. *J. A.*

THE PHALANOPSIS AT ELSTEADE.

MR. INGRAM'S collection of *Phalanopsis* will be, for the next week or two, a sight well worth seeing. The plants are cultivated in a low span-roofed house 40 feet by 12 feet, which is heated by twelve rows of 4-inch pipes, some of them running through the water-tanks, which are beneath the staging, by this means causing a constantly moist atmosphere; moreover, the plants are drenched with water at least once daily, and oftener if the weather be dry. I noticed that there was an abundance of air admitted at the top of the house, the panes of glass being cut so as to leave openings of 2 inches or rather more, which are kept open at all times. In like manner the bottom ventilators are always open, and the air admitted is compelled to pass amongst the hot-water-pipes at that part of the house, and becomes heated before coming in contact with the plants. These are in vigorous health, and are evidently at home under the kind of treatment adopted.

There are some very fine plants of *P. Sanderiana*, *P. Schilleriana*, *P. Marie*, *P. Ludemanniana*, *P. grandiflora*, *P. amabilis*, and *P. Stuartiana* in this collection. *X. J. Z.*

"ELIZABETHAN ENGLAND."

NEITHER "the glory that was Greece" nor the "grandeur that was Rome" has so intense an interest for us as the Elizabethan period in English history. It was politic, therefore, of Mr. Lathrop Withington to rechristen William Harrison's *Description of England*, which formed an integral part of *Holinshed's Chronicles* (1587), and no more appropriate designation could be given it than that of *Elizabethan England*. Although Harrison himself delicately speaks of his work as "this fable frizeled treatise of mine," as standing "in lieu of a description of my country," it has the rare merit of being an honest attempt at describing things seen by one who "had an especial eye vnto the truth." The genial, if at times dreadfully prosy, Harrison takes a very wide range of view. He deals more or less exhaustively with the degrees of people in the Commonwealth of England, with cities and towns, with gardens and orchards, fairs and markets, the laws, the church, food, diet and apparel, with building houses, indigenous commodities, with minerals and metals, cattle, fowls, dogs, fishes, woods, marshes and parks, the navy, the various methods of punishments, and a whole host of other things. To us, however, the most interesting section is that relating to "gardens and orchards," which, it may be mentioned, is in the second or 1587 edition, and not in the first issue of ten years' before. This portion has a much more than abstract importance, for it notes, among other things, how vegetables, roots, and salad herbs, which since the reign of Henry IV., had fallen into disrepute, began early in the reign of Henry VIII. to be objects of increased attention, and a very much extended cultivation. In Elizabeth's days, indeed, they were considered as essentials in every day's menu, such as it was. Doubtful sorts of fruit and fungi were eaten with an impunity which we of three centuries later might almost envy. Hops and Madder were grown extensively, and rare and interesting plants were introduced from abroad. Apricot, Almond, Peach, Fig, and Cornel trees, and even Capers, Oranges, Lemons, and wild Olives, were not at all rare.

Harrison himself had a garden which, he tells us, "is but small, and the whole area thereof little above 300 feet of ground, and yet, such hath been my luck in purchase of the variety of samples, that notwithstanding my small ability, there are very nearly three hundred of one sort and other contained therein, no one being common or usually to be had." Harrison has some quaint stories of fact or fancy to relate. Referring to a Rose mentioned by Pliny, he speaks, as a sort of sequel, of one at Antwerp in 1585, that had 180 leaves on one button or flower, and the historian could have had a slip of it for £10 (= £60 now), if he had not thought it "but a tickle hazard." We are glad to see that in this reprint—the first attempt, strangely enough, ever made to use any portion of "Holinshed" as a popular text-book—no editorial liberties have been taken in any way with the diction of Harrison; the orthography and typography are wisely modernised. We can heartily commend this little book, which is sold at a shilling, for it deals, as the editor observes, with an epoch which will never occur again "until we poor crawling mites on this rolling ball discover the socket it rolls in, and once again feel ourselves masters of all knowledge and devoid of all doubts." *W. Z.*

THE FRUIT AND VEGETABLE GROWERS OF NICE.

A REPORT on the prosperity of peasant proprietors in the vicinity of Nice has been forwarded to the Foreign Office by Mr. J. C. Harris, the British Consul. The general impression is, that the small proprietors of land in France are reduced to a condition of great poverty, and the impossibility of the small holder succeeding in cultivating his land profitably has been inferred. Last year Mr. Harris gave an account of the exceptions to this rule presented by the peasantry about Mentone, and he now states that he has been surprised to find the

Valley of the Oise, from Pontoise to its junction with the Seine, exhibiting a not less "brilliant" example of well-being, although the land is greatly subdivided.

The valley and the surrounding hills are largely cultivated for fruit and vegetables for the Paris market, but patches of corn are also mingled with fruit trees and other products. Asparagus is grown under the fruit trees as well as in patches, and also Kidney Beans. Many of these small owners realised fortunes under the Second Empire, when competition did not exist, owing to the incomplete state of the southern railways; but though the conditions have been completely changed in this respect, these peasants are still able to construct dwellings with considerable pretensions to comfort, and even to external adornment; to make investments, and to keep a horse and cart. The peasant proprietors in the region nowhere number less than a proportion of 67 per cent. of the total proprietors in a commune, and as the Alpine region is approached, this proportion increases, until around the higher mountains it is found that the whole of the land is owned by the peasants.

The success of these small holders is the more noteworthy, as their parcels of land being much dispersed, the employment of machines is rendered practically almost impossible. As machines, however, are not of much use in the cultivation of flowers and early vegetables, the peasants are not seriously handicapped on this account, though it is possible that the character of the cultivation may to some extent be determined by this difficulty. On the other hand, although the occasionally wide distribution of the patches of land held by one peasant necessitates much loss of time in going from one to the other, the cultivator seems to have an advantage in the variety of crops which he is able to produce, owing to differences of aspect, shelter, and so on. Again, the influence of these conditions in developing the intelligence and activity of the peasant is said to be very marked.

CULTURAL MEMORANDA.

FREESIAs.

These valuable introductions for the garden may be had in bloom in the depth of winter, and a long succession of flowers kept up by simple management. The first batch of bulbs must be potted early, and others in succession, and when the first are fairly on the move, they should be placed in a pit or frame where they can get gentle heat, and have the full benefit of the light by being stood up near to the glass. This will keep them sturdy and strong, and when the flower-heads begin to show, weak liquid manure will be a great help. We have some potsful so treated which are now in full bloom, and are highly prized for their elegance and delicious perfume; the favourite with us, is *F. refracta* alba, which comes in splendidly for button-hole bouquets. We pot Freesias in 4's and 3's, nine bulbs being potted in the former, and twelve in the latter. Any rich light soil suits them, the chief thing in their management being to water them very carefully till they get well into leaf, up to which time they require very little, and should have only just sufficient to keep the soil moist; and the same after their flowering is over; but the longer the foliage can be maintained healthy and green, the finer and better will the bulbs be. Freesias may be raised from seed and got strong enough to bloom within the year, but the seed must be sown soon, and placed in heat, and the young plants pricked-out and nursed on directly they are large enough to handle, so that they get no check to their growth.

PERPETUAL CARNATIONS.

One of the finest and the most popular is Miss Jolliffe, a very pale pink, which is now largely cultivated for market, the habit of the plant being compact, and its blooming qualities good. Others

are Alégatière and Boule de Feu, bright scarlet; and as worth having are, Garibaldi, Lucifer, Ne Plus Ultra, La Belle, and The Bride. To have these, or any other perpetual Carnations, at their best, they must be propagated early, so as to get strong plants by the autumn; and the sooner cuttings are put in the better, and these should be made by taking off any clean shoots that may not be showing flower. Cut them through close under a joint, and remove the lower leaves by rubbing them off by the aid of the finger and thumb. To encourage the formation of roots it is a good plan to prepare the pots for the cuttings by placing one of a smaller size inverted over the hole or upside down in the other, and filling in around it with sharp sandy soil, as the cuttings being then inserted between the two are kept well drained, and they feel the regular warmth from the heated air underneath. Put the pots in a Cucumber or Melon-pit at work, and if the cuttings show symptoms of flagging, a light syringing will revive them. Carnations are impatient of confinement, but if the house they are in is too airy, a sheet of glass is a great help if fixed or laid over and just clear of the tips of the cuttings. As soon as rooted, pot them singly into small pots, employing fibry loam, which ought to be carefully looked over before using it, to see that it is free from wire-worm, a dangerous pest. After potting, place them in a light pit, with a little warmth, and as soon as they move they should be freely ventilated in favourable weather. Early in May they will be fit to stand in the open. When placed there, it should be in a sheltered sunny spot, with their pots plunged in coal-ashes. Instead of potting, it is the practice with some to plant out the plants during the summer, and they may be grown very strong and large in that way, and labour saved in the water-ridge; but if planted out they must be lifted very carefully in the autumn, so as to secure good balls and all the fibrous roots possible, so as to prevent any great check.

SCHIZOSTYLIS COCINEA.

This showy autumn-flowering plant, either grown in pots or used as a cut-flower plant in vases, is a great help in conservatories and in rooms. We have been using them of late for dinner-table decoration, and in épergnes with light branches of yellow and silver-leaved Ivy, out of which the Schizostylis spikes stood out effectively under the artificial light. Schizostylis flowers associates well with Roman Hyacinth, as both are of a light and of similar character; and this is a point to be considered when two kinds of flowers are used in one stand. In warm, sheltered spots, the Schizostylis does very well outdoors, but as it blooms late it is of but little service when so grown, unless the plants are covered with a frame or hand-light; but the best way is to take the plants up and pot them, or grow them in pots, as then a little warmth may be afforded them, and the stock of plants be brought on in succession. To grow them in pots the plants should be shaken out as soon as they have done flowering, pulled apart and divided. This is very essential for good flowering. After potting in 7-inch pots the plants should be stood in a cold pit, and watered to settle the soil, and then kept close for a time to give them a start. During the summer and onwards till the autumn, they are best outdoors, plunged in a bed of cocoanut-fibre or coal ashes. If planted out the soil must be enriched, and the plants put out in patches a foot apart, and if attended to with water when the weather is dry they will make good growth. The finest I ever had were raised from seed sown as soon as ripe, and pricked out and potted off as soon as the plants were large enough; and those who have not stock to start with will find this a good way to begin. *J. S.*

CROTONS.

Crotons may now be increased by taking cuttings of the tops of straggling shoots on old plants, of about 3 inches in length, and inserting them singly in 60's, employing light sandy soil, surfaced with silver sand, and after affording the cutting-pots

water to settle the compost, placing them in bottom-heat of 90°, or rather less, in a close frame or case.

The cuttings will soon form roots, and as soon as these have been formed in some quantity, the pots must be taken out of the bottom-heat bed and stood on a shelf near to the glass in the stove, or at least where there is a night temperature of 60° to 65°. Damp the plants overhead with the syringe, more or less heavily, on bright afternoons at closing time, and afford water according to their needs. Thus treated, decorative plants of considerable usefulness will be secured for the conservatory during summer and onwards to the winter. *H. W. B.*

PLANT PORTRAITS.

EREMUNUS MICHARICUS, Regel.—A fine species from Eastern Bokhara, discovered by H. A. Regel. Flowers when open, white, with a reddish middle nerve. Height of the plant from 2½—3 feet. *Gartenflora*, February, 1890.

HYDRANGEA SPLENDIDA RUBRA FERNA.—A novelty of Lemoine's Nancy, resembling *H. s. prolifera*, but is a stronger grower. Terminal corymbs of double blossoms of a rose-white colour, turning at a later stage to lilac, violet, and blue, and at last to dull red. Plant quite hardy. *Wiener Illustrirte Garten Zeitung*.

FLORISTS' FLOWERS.

YELLOW CARNATIONS AND PICOTEES.

A good deal has been written recently about the culture of these, and their position as show flowers. These flowers have been long cultivated by the florist, but their production from seeds in England has not been carried out to the same extent as the white-ground varieties. The yellow-ground Carnations and Picotees have been grown and valued for a hundred years, but owing to the vagaries of their constitution, they have not been cultivated regularly or well. About fifty or sixty years ago we read of golden-crimson Carnations, and a very handsome variety is figured in colours in the fifth vol. of the *Horticultural Register*, but little stock could be obtained, and the plants had to be sold at a guinea per pair, a price that must have prohibited their culture in all but the gardens of rich people. About twenty years later, an amateur cultivator in the Midland counties, named Smith, was the originator of a fine strain of yellow-ground Picotees. I saw some of them in their decadence, and they had the fine quality of some of the best white-edged Picotees, but were mostly of a pale yellow ground. Mr. B. Simonite, of Sheffield, who knew Smith, and the flowers also when first introduced to the notice of the public, told me that they were obtained by crossing some of the yellow-ground varieties then in cultivation with the best and most vigorous of the white-ground type. In this interesting he obtained good quality, but a pale yellow, sometimes fading out to creamy-white, instead of the rich deep yellow of the Malmaison and Frogmore strains, or the coloured figures of Hogg's *Treatise* and that of the *Horticultural Register* of Paxton. The introduction of that vigorous but withal beautiful variety, Perkins' Prince of Orange, is within the memory of most middle-aged florists. I have grown it for twenty-five years, and it is still one of the most beautiful varieties in our collection, and yet we have never had a change of stock. A grand batch of seedlings was raised from it in Mr. Charles Turner's nursery at Slough some fifteen years ago. Some of these we have also in our collection, affording still further evidence of the vigour of the strain. I selected, some six years ago, one of the best of Mr. Turner's seedlings—Ne Plus Ultra, and crossed it again with Prince of Orange, and obtained a lot of seedlings most amazing in their great variety. Six of them were selected and sent out from Slough, one, named Agnes Chambers being considered the greatest advance made up to that time. Last year we had another selection, which marks a still further advance, the best being

Remembrance. There are also some flaked flowers, both flakes and bizarres. Of course, it cannot be expected that all the new varieties likely to be raised will continue to maintain their vigorous habit of growth, either in the open borders, or under the more careful system of pot-culture. This would be expecting too much from any section of Carnations or Picotees, white or yellow; indeed, one or two of the best white-ground Picotees I have raised are of such poor constitution, that they can never be sent out. It therefore behoves the raisers of these, quite as much as it does those who produce yellow-ground varieties, to make sure that their seedlings have good constitutions, as well as flowers of high quality.

A few words on culture, and perhaps this may be thought to be an oft-told tale. I grow them in two ways—that is, planted out in the open borders, and in pots in frames; and I find that they are more liable to injury from dense fogs (accompanied by frosts than the white-ground varieties are; but clear dry frosts do them no injury, nor do they seem to suffer much from fogs when it does not freeze at the same time, nor are they injured by any kind of weather when they can be placed in a heated house, and the plants are arranged on shelves near the glass. The heating apparatus need only be used to keep out frost. *J. Douglas.*

THE GOLD-LACED POLYANTHUS.

I had hoped to have seen during the autumn an announcement to the effect that some of the newly raised Lancashire varieties of Gold-laced Polyanthus have been put into commerce; but the time is not yet. During the past half-dozen years, several of these were awarded First-class Certificates of Merit at horticultural meetings in the North, and one is disposed to ask, why these new flowers are not available for cultivation by others? It is because they die, and the chance of circulating them is lost. Do they fail to give increase? Do they disappoint, after further trial, as not a few certificated Auriculas have done? or is there a selfish interest at work, which prefers to keep in the hands of their possessors the gratification of growing them? It is quite certain that, except in the case of those who have been fortunate enough to raise promising seedlings, the old standard varieties have to be depended upon: Exile, Cheshire Favorite, George IV., Prince Regent, Sidney Smith, and William IV.

There does not appear to have been the slightest cessation of activity in my plants of named gold-laced Polyanthuses since they were potted in October last, excepting in the brief period of sharp frost of a few weeks ago; and the unusually mild weather since has maintained that activity, and the flower trusses are showing at an inconveniently early period; but these may be sacrificed, as others will certainly follow, though I always think the first pips are the best ones.

Until the end of November my plants occupied a cold frame, and had an abundance of ventilation. These were later removed to the confinement of the Auricula-house, because fog and frost were doing them hurt, and the slugs were unusually attentive. The plants are kept moister about the roots than the Auriculas, for if a Polyanthus become too dry, and the leaves flag, there is much danger of losing them. My potted plants, with a few exceptions, are in 60's, and are well rooted, although not pot-bound. Early in February they will have a slight shift into pots a size larger, and in which they will flower. As soon as possible they will again be placed in the cold frame, for, judging from present appearances, retarding instead of hastening the period of bloom will be necessary; but, then, no one knows what weather is likely to visit us during the next three months.

I am sure the National Auricula Society has shown a laudable desire to encourage the more widespread culture of the gold-laced Polyanthus as an exhibition plant, but the time has not yet come. The cultivators for exhibition are a stationary quantity. During the past two or three years we have had to deplore the absence of the collection grown by Sir J. F. D. Llewelyn, and, with the

exception of Mr. Samuel Barlow, no northern grower puts in an appearance in London. I have just been making the experiment of endeavouring to popularise the gold-laced Polyanthus by offering plants of the standard named varieties at a cheap rate in the trade. But no one appears to care to buy, and this I take to be an indication that for all decorative purposes the improved giant fancy varieties are much more highly esteemed. *R. Dean.*

CARNATION LOUIS BERNHARD.

This is a capital winter-flowering variety, of perfect form, deeply serrated at the edges, with a calyx not given to splitting, a good grower; and the colour an intense maroon-climson, with a purple shade, is quite exceptional.

THE ROCK GARDEN.

SAXIFRAGA PELTATA.

This probably is the giant of the family, and a very grand plant, I think, too. I had a plant some years since, and kept it in a pot, as when received; sometimes it got very dry and much withered. At last it occurred to me, that its habitat is the Sacramento river, so I put it out of the pot close to the edge of the stream in the bank in the front of my house, where it grew a little, and had a flower-spike. Last year it had leaves 1 yard high, and 15 to 18 inches across, and some of its large roots or rhizomes touched the water, and ran along under the surface of the soil for some distance from the main root; but they are now upon, and amongst the surface herbage, and are very strong. The plants will, no doubt, flower well if all goes well with them, and they are not injured in any way; but the strong wind at times twists the leaves about very much and disfigures them. Perhaps others have grown them in a similar way. *J. S. C.*

THE KITCHEN GARDEN.

ROOTS AND TUBERS.—The remaining tubers of Jerusalem Artichokes should be dug up, and the best stored for consumption in moderately moist earth or sand in a cool place; those for planting put into a heap, and protected from frost with a covering of litter till, the ground is in readiness for planting. When digging up the tubers, see that every tuber, or portion of one, is secured, or much trouble will be caused later by these escapes. Trench the ground deeply, and if poor, work rotten manure into it, and afterwards draw drills 6 inches in depth, and 2½ feet apart, and plant the tubers 18 inches apart in the rows. Choose fine weather for the planting, and if the ground is of a heavy and adhesive nature, road-scrappings, burnt refuse, or coal-ash, may be applied when digging it, with advantage.

Rhubarb.—The roots left outside to be forced moderately where they stand, should be afforded some covering to prevent check from frost. Rhubarb may be brought forward readily at this season; all that is required, in the absence of pots or tubs, being a few stout stakes, put in around each stool, over which some long litter, or leaves and litter, may be placed.

Seakale.—Before growth commences put the pots over the crowns to keep them in darkness. Seakale at this season is so easily forced with the aid of some fermented leaves, and a heap of finely-sifted coal-ashes placed over the crowns. Remove these materials as soon as the cutting is finished. Cut the crowns smoothly over when the ground is cleared, and protect them from frost with some coal-ashes, or a handful of litter.

Potatoes, which may be stored in pits in the open, should be examined on a bright day, the sprouts rubbed off before they get too long, and diseased tubers taken out and buried. Sets should be spread out thinly on shelves or floors in places proof against frost, but where air and light may reach them.

Miscellaneous.—For early use, a sowing of some early white variety of Celery may now be made in heat. Where early Brussels Sprouts are required, the seed of some approved strain should be sown,

and treated as directed for Cauliflowers in a former Calendar. To obtain compact, hard sprouts, plant on rich land, made very firm by treading.

If not already done, beds may be got in readiness for the Parsnip crop by deeply trenching the soil. Beds for a variety of sowings may be likewise got ready, thereby preventing delay at critical moments. *H. Markham, Mereworth Castle, Maidstone.*

THE ORCHID HOUSES.

EAST INDIAN HOUSE.—Some difficulty will be found in keeping the different houses at an even temperature, owing to the cloudy, windy, and bright weather experienced during the past week, and as much air will find its way into the houses at such times, I would advise that but little air be admitted through the ventilators, the cold winds doing more harm than a rise of 5° or 6° of temperature caused by a gleam of sunshine.

Where the Phalaenopsis-house faces nearly or quite due south, it will be advisable to have the shadings put up, so that they may be utilised during periods of strong sunshine, but this measure may not be yet necessary in the vicinity of London, where fog and smoke coat the glass with a thick film of blacks.

The earliest plants of *Dendrobium heterocarpum* may be had in bloom at Christmas, and by gradually bringing in others from the cooler house, a succession of flowers may be kept up, filling the house with a fragrance of Primroses until February. As the *Dendrobiums* go out of flower, repotting or basketing should be attended to if found to be necessary, and but little water should be afforded them for some time afterwards—in fact, not until the young roots are seen to be making good progress—the young growths being very liable to damp off. The beautiful *Saccolabium Harrisoni* and its near companion plant, *S. illustre*, now in flower, should be in every good collection, as both are beautiful, besides being very fragrant. The plants will do well either in pots or baskets, but they like a light position, and much water must not be given them during the winter. The best way in which to ascertain if water is required is to feel the bottom leaves of the plant, and if these be firm no water need be given. The same remark applies to all sections of *Aurides* and *Vandas*, too much water being the chief cause of spot on the foliage. Temperature 65° by night, with a rise of 5° by day.

Cattleya-house.—Many varieties of *Laelia anceps* will now be passing out of bloom, and should be at once seen to, as they will almost immediately throw out great bunches of young roots from the base of the pseudobulbs last made, and if repotting be not done before these push out, there is great danger of breaking some of them, however carefully the operation is performed. The white variety introduced five years ago is the finest acquisition we have had for many years as a winter-flowering Orchid, and when once they have reached the flowering age, they are freer flowerers than the red forms; *L. Sandersoniana* seeming to be the most floriferous, giving four and five flowers on fair-sized bulbs. Temperature 60° at night, 65° by day.

Intermediate-house.—Plants of the beautiful *Laelia harpophylla* are now opening their flowers. There was a time when the culture of this plant was not understood. It used to be placed as a rule at the warmest end of the East Indian-house, where it lingered between life and death, usually covered with thrips, and a fruitful source of trouble to the grower, and it was a very expensive plant to purchase at that time. If grown in peat and sphagnum moss in pots, with plenty of water throughout the year, it does well in this house. *A. G. Catt, Parkfield, Worcester.*

FRUITS UNDER GLASS.

Pot Vines which have set their bunches, should have their crop regulated, and the berries thinned. The roots will now be active and able to receive stimulants in the shape of warm liquid manure or clarified soot-water, or surface sprinklings of Thomsons', or some other artificial manure; slight top-dressings of turfy loam and fresh horse-droppings should also be frequently applied, the pieces of turf ultimately reaching several inches above the rim of the pot. Prepare and put in eyes for next year's supply, one eye in a 60-pot, potting firmly, in

rather light sandy soil; or put on a 4-inch square of turf, give a gentle bottom-heat of fermenting material, place near to glass, and in a temperature of about 55°. Yearling canes should be cut close back if they have failed to make fruiting sizes, and be not reotted till growth has commenced again.

Early Vinery.—Follow up the details previously given, taking advantage of every bit of sun-heat and light, and on mild days give plenty of fire-heat in the pipes, and at the same time admit air freely in the front, letting it pass near to the warm pipes, also open the lights a little at the top to get circulation without causing a draught. When the air is keen and frosty, ventilate in reverse order. Keep a look out for adventitious roots on the rods; if they be seen it is a sign that the ventilation has hitherto been imperfect—probably kept too close—and damp, which if continued, will cause the leaves to become watery on the under side. Disbud and shoot stops at the earliest opportunity, and remove superfluous bunches. Should mealy-bug have previously obtained access to the Vinery, perseverance now will out-hunt him. Eggs which escaped, will now be found developed into the perfect insect, and a touch from a brush dipped in paraffin oil will kill the pest. Vines planted in outside borders should have their exposed stems well wrapped with hay-bands to protect them from frost; we once narrowly escaped a catastrophe by the removal of this covering by birds during a sharp frost.

Finish pruning and cleaning mid-season and late-ventries, and have all in readiness for starting. If a dressing be necessary, use Gishurst's compound, 1 lb to 8 oz, to the gallon, or the same quantity of soft-soap with a small addition of flowers-of-sulphur. Vineries started now, will ripen their produce in five months.

Peaches and Nectarines.—The early house will need constant attention during the setting of the flowers, especially as there has been so little sunshine, and the atmosphere is so damp. Go over the expanded flowers at mid-day with a camel's hair brush. As soon as the setting is complete, gradually increase the temperature. Remove at once superfluous and ill-placed fruit, and syringe regularly, securing a bracing, buoyant atmosphere. A second house should be started, and if a bed of fermenting leaves be introduced into the house, the moisture and escaping ammonia will help to swell up the buds.

Strawberry-house. Plants may now be introduced in larger batches, according to demand; examine the drainage, and remove moss or filth from the surface; dip the plants in a solution of soft-soap and sulphur, afterwards laying them on their sides until they are dry. A little extra heat may be given to those earlier started batches now showing for flower, in order to draw out the flower-scape. La Grosse Superbe still leads with us in all points, against Noble, King of the Barbes, and Pauline; those already set will now enjoy a shelter near the glass in a succession frame pit or other warm-house, but are not good inmates for the Vinery, as the early plants are almost always attacked by red-spider.

Melons.—Plants should be now ready for planting, preference being given to large pots for this crop; build up pedestals of dry bricks on edge, with a large turf on the top to receive the pots, filling up intervening spaces with sweetened fermenting materials; insert the plant near to the side of the large pot, and leave plenty of space for top-dressing. A stake should be given, and by way of precaution from slugs or damps, a little bit of powdered charcoal around the stem.

Cucumber-house.—Plants do best when grown on the extension system in low pits, with a damp air and the least ventilation; under such treatment they are little troubled with insects. Old plants which have been bearing lightly through the winter will now respond to a liberal top-dressing of turf loam and old Mushroom manure. If grown in pots as advised for Melons, replenish the fermenting materials, and increase the temperature and moisture. Encourage young shoots to stretch out, but do not stop them till several new leaves have been made; gradually remove a little of the old bearing wood and leaves. The temperature should be 70° at night and 80° to 90° by day.

Tomatoes grown on as single cordons in 10 or 12-inch pots will ripen fruit early. Hackwood Park, Perfection, and Ham Green Favourite are good varieties to grow. Prepare for planting out later crops in soil made firm but not rich.

Pigs are now pushing. Use the syringe vigorously, but do not omit to dry the wood daily, or very probably a good number of rusted fruit will be noticed. Keep the temperature at 60° by night, running up to 60° to 65° by day. W. Cramp, Madresfield Court, Malvern.

THE HARDY FRUIT GARDEN.

ORCHARDS.—Pruning should be completed as soon as possible, and where the trees are old, and have been neglected, the first thinning should not be very severe, otherwise the check would defeat the object in view—increased fruitfulness. The centre of the tree must be opened out, to admit light, cutting back some of the main branches, and allowing a quantity of young wood to grow on, as this will give vigour to the tree, and the young strong shoots soon become studded with flower-buds, when the trees have been sufficiently opened to admit the light. The final thinning may stand over for another year. Dress the large wounds with lead-coloured paint, and if, as is often the case, moss and lichens abound, scrape the main branches and stems with a piece of hoop-iron, and wash them with a solution of quicklime, with a little soap put into it to take off the glaring whiteness.

Any trees which appear to be exhausted may have a heavy mulching of soil and manure; lacking these materials, road-scraps and any soil which may be at command will stimulate them. Where the trees are very old, and the ground has become fruit-tree sick, it is much better to plant on fresh ground, either tillage or pasture, first seeing that any needed draining of the land is done, nothing being worse than planting on wet soils; and the drains must be deep, and near to each other, so as to carry off the water from beneath the lowest roots. Select scions from healthy trees for grafting, and lay them in a cool place out of the reach of sunshine. If it is intended to graft large trees, two year old wood as thick as one's finger answers the best, and the triangular notch method of cutting a stock is superior to cleft grafting for large trees, and of which it indeed is a modification. From the beginning of March till the middle of April is the best time to put on grafts.

Wall Trees.—The mild weather is beginning to tell unfavourably upon fruit trees, particularly the Peach, Nectarine, and Cherries against walls. In our climate it is advantageous to keep fruit trees, which often bloom precociously, from bright sunshine at the early part of the season, so that flowering is retarded. Peaches and Nectarines which have been untied or unnailed and supported securely by stakes driven into the soil in front of the wall, will remain untouched until we have a change in the weather. I would repeat this week my advice as to syringing with shakel lime-wash all fruit walls. Syringe once in three weeks any fruit trees that are not too forward in bud with soap-suds into which a little petroleum has been well stirred. It forms a good preventive of green and black aphids. Apricots will soon be in full bloom. The due protection of the trees must receive attention. Next to glass as a protection to wall fruits movable blinds are the best, and, where these are not available, netting, boughs of Spruce Fir and Yew may be utilised. Plums and Cherries, being of hardier constitution, will bear a few degrees of frost without injury. The weather hitherto has been favourable for the planting of fruit. No newly planted trees should be pruned at present, neither should they be tied or otherwise securely fastened before the soil has subsided. All other pruning should be completed as soon as possible, with the exception of Peaches, Nectarines, and Figs. *A. Ewins, Lytle Hill, Hushmore.*

THE FLOWER GARDEN.

THE HERACROTES BORDERS.—The continuation of mild weather has caused most of the herbaceous roots to show signs of growth; therefore, where it is found necessary, dividing and transplanting should now be completed. In preparing the ground for planting or for new borders, let it be trenched, a dressing of well-decayed leaf-mould or manure being given heavy or light, according to its condition. Ascertain before planting a new border the height and nature of growth of each subject, as this should determine the position each will occupy, taking care that each clump of roots, or root be inserted deep enough, so that when the newly-dug soil has subsided, the root-stock is not 1 or 2 inches above the level. Anemones and Persian Ranunculuses may still be planted, and their flowers will form a succession to those planted in October.

Protection to Plants.—At the time of writing there is a prospect of frosty weather, and many of the

spring-flowering bulbs being in bloom, they may suffer from the effects of frost unless afforded some sort of protection. Hyacinths and Tulips should have a mulching 2 inches thick of half-decayed leaves or Cocoa-nut fibre, and when showing bloom, branches of evergreens may be stuck in thickly between them.

All trees or shrubs which are not absolutely hardy are much safer if a mulch be placed around their roots; this may consist of leaves, litter, or coal-ashes. The varieties of Encalyptus, which seldom withstand more than 12° of frost, should have their stems covered with hay or straw bands, and where the frost is intense, a double covering of the same, for if the tops are injured, by preserving the stem a fine specimen is still ensured for the coming season. Camellias, Nerium (oleander), Ceanothus punicus, whether on walls or not, should receive protection from mats or evergreen branches, and in no case omitting the mulching at the roots.

Strawberries.—Continue the pruning and thinning of these where such is necessary, and clear out all the rubbish, which may be burnt with the prunings, the ashes, when mixed with the leaves, making a capital manure for flower borders. On light soils and where the roots of shrubs and trees are consequently near the surface, it is a great mistake to dig the ground at all, an annual hoeing being all that is needed. Where dead leaves are not unsightly, and there is no danger of their being blown out over the lawn, it would be advisable to allow them to remain. Blank spaces should be filled up, and in the case of evergreen plants, remove as much soil with the roots as may be possible; and in the case of all newly-planted trees or shrubs, secure them to stakes at first provisionally, and after the settling of the soil, permanently.

Seeds, &c.—Sow in heat, seeds of Dahlias, Aralias, Chamae-puce, Wigandias, Solanum, Ferdinanda, Cannas, &c. Place stock plants of Verbenas, Lobelias, Ageratums, Fuchsias, Alyssums, &c., in gentle heat, for the production of cuttings. Cuttings strike better if they are taken from plants in a warm temperature, and spring-struck plants of all the above are far preferable to autumn ones.

Calceolarias, which may have been struck under hand-glasses or in cold frames, should be planted out in cold frames, or where they can be protected. Plant from 4 to 6 inches apart, in a compost of one-half well-decayed leaf-mould, one part loam, and one of common sand, giving plenty of air on all favourable occasions. *D. C. Powell, Powerham, Essex.*

THE APIARY.

The month of January has been very remarkable in many respects. The thermometer has been up and down, and, with the very mild weather, the bees have been out. On some days one would have thought the bees were going to swarm, from the frantic way they were flying about. From various visits we have paid to the fronts of our hives, it would seem that as yet there has not been much mortality among the bees, as we could find very few dead ones about the entrances. But there may yet be much sharp weather and consequent mortality. It is also evident that some hives have begun to breed. This may be discovered with fair accuracy without opening the hives. If you see particles of wax lying outside the hives, you may be pretty sure that the bees are busy cleaning out cells, and that the queen is laying eggs in them. Though flights are very good for the bees, it must be remembered that a spell of such weather as we have had lately causes stores to materially decrease, and if there is any doubt as to the quantity being sufficient to carry on the bees till April, food must be carefully given. We have said before, that liquid food must not, on any account, be given yet. If you suspect stores are getting short, give the stocks about 3 or 4 lb. of candy each. Do this with as little disturbance as possible, and only in the middle of a fine day. Lift the coverings very carefully, and after pulling a little smoke on the bees to keep them down, lay the candy flat down on the frames immediately over the cluster of bees. Cover them all up warm at once. It is, however, a fact, that those bees which do not require any attention at this season of the year are the best, and turn out the best. Though we believe firmly in letting the bees alone as much as possible at this season of the year, you may with great advantage frequently pay a visit to the apiary, and look away dead bees. *Bee.*

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be written on one side only of the paper, and sent as early in the week as possible.

NEWSPAPERS. — Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

		Royal Horticultural Society: Annual General Meeting, at 117, Victoria Street, S.W., at 3 o'clock; an Fruit, Floral, and Scientific Committee, at the Drill Hall, James Street, S.W.
TUESDAY,	FEB. 11.	
		SALES.
MONDAY,	FEB. 10.	Lilium auratum, and Hardy Bulbs, at Protheroe & Morris' Rooms.
		Roses, Greenhouse Plants, &c., at the City Auction Rooms, by Protheroe & Morris.
TUESDAY,	FEB. 11.	Nursery Stock, at the Nurseries, Wandsworth Common, by Protheroe & Morris.
		Roses, Fruit Trees, Shrubs, Border Plants, &c., at Stevens' Rooms.
WEDNESDAY,	FEB. 12.	Lilies, Hardy Bulbs, Greenhouse Plants, &c., at Protheroe & Morris' Rooms.
		Nursery Stock, at The Woodlands Nursery, Maresfield, near Uckfield, by Protheroe & Morris (two days).
THURSDAY,	FEB. 13.	30,000 Liliums in variety from Japan, 20,000 Pearl Tuberoses, Orchids in Flower, &c., at Stevens' Rooms.
FRIDAY,	FEB. 14.	Imported and Established Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	FEB. 15.	Roses, Fruit Trees, Shrubs, Border Plants, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—39° F.

The Royal Horticultural Society.

The annual report of the Royal Horticultural Society has been circulated in anticipation of a general meeting on Tuesday next.

In some respects it is a highly satisfactory document; in others, less so. It has a defect this year which is unusual in similar documents—it is too modest. In the year 1889, the Council was left pretty much to its general work—the period of revolution, migration, and reconstruction was passed successfully, and the managers had to settle down to their regular work. The work of the Society "cannot be said to have stood still during the year 1889." This is the opening paragraph of the report, and those who know what has been accomplished during the year will agree with us that it is far too modest a statement. Three conferences were held at Chiswick—yes—but what conferences!—has there been anything like them for utility in the annals of horticulture except the preceding meetings of a similar character under the auspices of the same Society? We know of none. The ordinary committee meetings have been as good and as interesting as they have been in former years. Much good work also has been done at Chiswick. The *Journal* of the Society has been published with greater regularity, and its contents have been quite up to the average.

In former years the contents of the *Journal* left little to be desired, except as regards regularity of publication; but this sufficed to stop all interest in it, and though the Fellows were entitled to it, they cared so little for it, that they did not even take the trouble to apply for it. Under the new régime, it is sent to the Fellows as it is published, and thus those residing at a distance, and who cannot make use of the Society's garden or attend its meetings, do obtain substantial value for their money. The work that has been done by the Society during the last few years in the matter of fruit culture deserves special recognition, the more so as it has been ignored in some quarters where a different treatment might have been expected—a fact that does not create much confidence in the knowledge of their business possessed by some who are desirous of taking the lead in these matters. Amongst other things we are told that the Conference Report on Apples prepared by Mr. BARNON is now published by the Society in a cheap edition, at the cost of 1s. 6d. only.

The 3 o'clock lectures have been varied and good, but the Drill Hall is not a favourable place for such gatherings.

The financial statement, we are not surprised to see, shows a balance on the wrong side, a circumstance that is not to be wondered at, considering the expenditure on the *Journal* and at Chiswick—expenditure that, we doubt not, will prove remunerative. The Temple show yielded some £198, but the cost was £131. The meetings and Conferences brought in only £29 (£), while the expenses for labour and other matters connected with them amounted in round figures to £135, to say nothing of the free labour bestowed by many of those interested. Taking the figures as they stand, they are very significant: the sixteen meetings and the three Conferences, each lasting over two days, cost collectively £135; the Temple show (two days) cost £131. Now, so far as pure horticulture goes, those sixteen meetings, or any one of the three Conferences, was far more valuable than the Temple show, fine as it was. We are not disparaging big flower-shows; they have their advantages; they are appreciated by a large number of Fellows who are not otherwise much interested in the work of the Society; they attract the public, and afford the Society an opportunity of showing what it is doing, and they give the commercial exhibitors a chance of doing some business; but when all allowance is made, the disproportion is still very large. The amount spent in advertising might be increased with advantage, especially in the populous neighbourhood surrounding the garden at Chiswick.

It is very evident that the guinea rate of subscription will not pay unless a very much larger number of subscribers join the Society, and every effort should be made to induce those interested in horticulture to join the ranks.

We are not pleading for charity sake, nor for a Society that has no record, or one that has its reputation to make; we are invoking aid for the Royal Horticultural Society, as the national representative and exponent of horticulture. Recollecting what its aims and objects are—the advancement of horticulture—we ask boldly what has any other Society accomplished? what even have all the so-called horticultural societies, put together, done that will bear comparison with the work done by the Royal Horticultural Society? We are, of course, not disparaging other societies—in their way they do good and useful work, but it is work professedly of a more restricted character, ephemeral and spasmodic in duration, devoted

rather to the pleasure of the moment and to local interests than to the substantial benefit of horticulture.

One has only to turn to book to see this. The records of the Royal Horticultural Society are from a horticultural standpoint, such as any society might be proud of. What society of like nature can show anything like it? None. And this has always been so: in times of turmoil and difficulty the horticultural record has been good. Assuredly, then, the Society has ample claims on the sympathy and assistance of all classes of horticulturists, the special societies, the local societies, the country gentlemen, the dwellers in villadom—all these should supply a large and constant stream of recruits. If the good work the Society has done and is doing could be brought home to these classes, we have no doubt that the Society could not only be maintained on a satisfactory financial basis, but resume those experimental and other researches which have in the past conferred so much honour on it.

It would be a marked injustice were we to conclude this notice without an expression of thanks to the Council for their services during the year, and if we single out the names of the Treasurer, and particularly of the Secretary, for special acknowledgment, it is because their devotion and their labours have been the theme of universal comment among those who have had the opportunity of watching the proceedings of the Society.

TURNER MEMORIAL PRIZES FOR 1890.—The following prizes are offered by the trustees for the present season. National Tulip Society. Exhibition to be held at Manchester. The date not yet fixed; probably the last week in May. For six distinct seedling Tulips; three rectified, and three breeders: 1st prize, 30s.; 2nd prize, 20s. For twelve distinct named Tulips, six rectified and six breeders: 1st prize, £3; 2nd, £2; 3rd, £1. At the Tivishead Horticultural Society's exhibition the following prizes are offered for Roses, viz.: for twenty-four cut Roses, distinct (amateurs only), 1st prize, £5; 2nd, £3; 3rd, £2. At the autumn exhibition of the Royal Caledonian Horticultural Society, Edinburgh, September 10 and 11, twenty-four Dahlia blooms, distinct, show and fancy varieties: 1st prize, £5; 2nd, £3; 3rd, £2.

GARDENERS' ORPHAN FUND.—A meeting of the committee took place at the Caledonian Hotel, on the 31st ult., Mr. GEORGE DEAL presiding. The minutes of the last meeting having been read, Mr. A. F. BARNON read a list of the special sums sent in since last meeting, as follows:—Proceeds of a concert at Worksop, £56 4s.; Chrysanthemum show at Reigate, £50; Chrysanthemum show at Edinburgh, £5; from the committee of the Chrysanthemum show at Market Harborough, £1 1s.; and the sum of £10 12s. 3d. from six money boxes, that most active and sympathetic worker, Mr. J. HIGGINS, of Birmingham, leading the way with the sum of £5 8s. Votes of thanks were passed to the contributors of the above sums. The Hon. Secretary read a letter from Mrs. WILDSMITH, of Heckfield, announcing the death of her husband, Mr. WILLIAM WILDSMITH, who was from his first an active worker in the interest of the Fund, and a letter of condolence was ordered to be sent to her. The proceedings closed with the usual vote of thanks to the committee.

RAILWAY RATES AND CHARGES.—At the adjourned meeting of the trade held last Friday at the Hotel Windsor, and at which Mr. HARRISON, of Leicester, presided, the various objections to classifications lodged by the Nursery and Seed Trade Association were considered, and the names of the witnesses to be called in support of the several objections were selected.

FIG. 28.—LELIA GOULDIANA: FLOWERS ROSY-CRIMSON. (SEE P. 171.)

WORTLEBERRY WINE.—According to the *Zeitschrift für Obst- und Gartenbau* in Saxony, a description of wine similar to claret in colour, and made by J. FROMM, Frankfurt-à-Maine, from the Wortleberry, has been brought into notice, and recommended for use in hospitals.

KEW "BULLETIN."—The *Kew Bulletin* for February contains much useful information on the sugar production of the world, in a paper by R. GIFFEN, Esq., LL.D., Assistant Secretary, Board of Trade, presented to Parliament in May of last year, and issued to the public in June. There are also articles on the Manufacture of Quinine in India, the use of Maqui Berries for Colouring Wine, Vine Culture in Tunis, Phylloxera in Victoria, and the Botanical Exploration of Cuba.

CHRYSANTHEMUMS IN VIENNA.—Although the first Chrysanthemum exhibition held in Europe was held in Vienna in 1831, so little attention has been bestowed upon the plant in that city that the show organized last autumn was described as a "novelty." About 1000 plants were shown in 1831, belonging to fifty-five different varieties; this year the same number of plants represented 400 varieties. The massing of the plants in a large glass rotunda was described as very effective, but nothing of great excellence was noted.

EUCALYPTUS GLOBULUS SEEDING.—So far as we know, the fruiting of *Eucalyptus globulus* in the open air in these islands is extremely rare; but we have received lately some well-developed seed-vessels of the plant from Mr. ROBERTS, gardener at Tan-y-bwlch, North Wales. These were gathered from trees which were raised from seeds sown in March, 1882, planted out in the following May, and have remained unprotected ever since. They are now stately trees. That these rather tender trees stand out-of-doors and bear fruit speaks much for the mildness of the climate of the district in which they grow; but there are many other places in south-west England and Wales, and in Ireland, where an equally mild climate prevails, and where *Eucalyptus globulus* and *E. coccifera* may be planted with safety.

WILTS HORTICULTURAL SOCIETY.—The usual annual dinner of the Wilts Horticultural Society was held on the evening of the 31st ult. at the Council House, Salisbury, the Mayor presiding. After the dinner, the business of re-electing the Society's officials, and reading a statement of the state of its affairs, together with the passing of a vote of thanks to the Honorary Secretary, Mr. H. W. WILLIAMS, brought the meeting to a satisfactory conclusion.

SOCIETY FOR THE ENCOURAGEMENT OF ARTS, MANUFACTURES, AND COMMERCE.—On Friday evening, February 7, at the Society's Rooms, John Street, Adelphi, London, W.C., a paper on "The Utility of Forests and the Study of Forestry," will be read by Dr. SCHLICHT. The chair will be taken at 5 o'clock by Major-General J. MICHAEL, C.S.I.

ARUM LILIES IN THE OPEN AIR.—The conditions of cultivation adopted for a particular plant in a northern climate would naturally require modification to a greater or lesser extent when that plant is introduced to a southern spot. The mild, uncertain atmospheric influences of the latter have to be taken into consideration equally as much as the austerity and extremity of the former. The methods adopted by gardeners in one part of the country are naturally of great interest to those of the fraternity who have to battle with conditions widely different. For this reason, therefore, if for no other, the following account of Arum Lilies at Scilly will be read with interest:—To see Arums growing in their native beauty one should (writes a correspondent) visit the islands of Scilly, where they are evergreen;

before the old leaves die away, the young ones come on to take their place. In good damp soil the plants attain to the height of from 4 to 5 feet, and so congenial is the climate that a moderately-sized root will in three years form a fine clump, composed of half-a-dozen or more flowering crowns and scores of offsets, each of which will, if planted, soon make nice plants. In fact, it is a hard matter to clean the ground after it has been planted with Arums for three or four years. The time of blooming extends from Christmas to midsummer. Sometimes they give out two crops of spathe in one season. Last year I had a fine batch, with the spathe showing white early in January. A sharp hoar-frost cut them all off; but they threw out fresh growth, and flowered freely in June. At the present time they are throwing up their spathe again. I have a friend who has been cutting for the last fortnight from growths in the open air, during which time he gathered one with a double spathe. Their culture is exceedingly simple, as they do very well in almost any ordinary soil; but the flowers are generally finer and better developed by an occasional watering with liquid manure. They must, however, be grown in a perfectly open spot, where they have not only the advantage of sun when in flower, but also when "at rest."

NUTS.—The male catkins and female blossoms are remarkably numerous, says a correspondent, on the Nut bushes in some districts of Kent, and alarm is felt by many that the extreme earliness of the bloom may result in a poor crop of Nuts, many female blossoms being already fully expanded. Many more letters than we are able to publish have reached us, stating facts connected with the earliness of the bloom on the Hazel and its varieties, but in none do we find any notice of the flowering of the Byzantine Nut, *Corylus Colurna*.

LONDON GEOLOGICAL FIELD CLASS.—A course of four lectures on "The Tertiary Rocks on which London Stands," will be delivered by Professor H. G. SEELY, F.R.S., on February 15, and the three following Saturday afternoons, at four o'clock, by the kind permission of the Gresham Committee, at the Gresham College, Basinghall Street.

MILDNESS OF THE SEASON.—As proofs of the unusual mildness of weather prevailing over these islands, we have received from Mr. P. BARN flowers of a new species of *Narcissus*, *N. cyclamineus*, with small tubular flowers of a bright golden yellow—a very pretty subject for pot culture; *Crocus Susianus*, charming, deep orange-coloured flowers; *C. Sieberi*, purple blossoms, short in the petals, with conspicuous yellow anthers; and *Galanthus Elwesii*, one of the very best of Snowdrops. From Cork, Mr. B. HARTLAND sends a Japan *Berberis*, with a yellow tinge of flowers, deliciously fragrant. At Kew the plant refuses to bloom out-of-doors, so says our correspondent, but in Ireland it is different. The now well-known *Ard Rich* *Dafodil* came from the same place. This is certainly our earliest variety. In the neighbourhood of London the bloom-buds are prominent, but not open. Other *Dafodils* in bloom at Cork are North Star, Saragossa, Minerva, *vasiformis?* *pallidus* *precox*, *bicolor* *precox*; and of other things, mention may be made of *Chionodoxa Lucilla*, *Hepaticas*, *Aconite*, and *Triteleia*.

THE ATTAR OF ROSES.—Rose water is extensively made in India. At Ghazipore, in Bengal, there are hundreds of acres laid out for the purpose. The harvest is in March and April, and the result of the distillation is to supply about one quart of Rose-water from each thousand of the blooms; but adulteration is very much resorted to, oil of Sandal wood being the medium, and the people of India do not seem to mind much whether they get the odour of the Rose or the Sandal for their money. It is comparatively cheap where it is made, costing 2s. or 3s. a quart even when adulterated. Otto or attar of Roses is much more important and expensive.

The origin of this condensed perfume is told in one of the romantic stories of the East. It is said that MOORHEAN BEGUM, the favourite wife of JELAN-GIEG, was walking in her garden, through which ran a stream of Rose-water, when she noticed some oily particles floating on the surface. She had them skimmed off, and their aroma was found to be so delicious, that means were devised to produce the precious essence in a more regular way. The method is an extension of that which is used to produce Rose-water, but it takes 1000 bushes to supply about 2 oz. of attar, and its value is seldom less than £20. At that price, and unadulterated, it is sold mainly to Europeans, while in a less pure form it is vended in the native bazaars. It is bought by the Westens, however, for manufacturing purposes, and not to be used in its pure condition.

KENT COUNTY CHRYSANTHEMUM SOCIETY.—The second annual meeting of the above Society was held at the Rink, Blackheath, on Thursday, January 30, and at which there was a good attendance of members. S. S. BAXTER, Esq., in the absence of their esteemed President, F. W. UTROR, Esq., took the chair. After the annual report, and the very satisfactory financial statement for 1889 had been read by the Honorary Secretary, Mr. NEWS, and adopted, the officers and members of the committee of last year, with one addition, were unanimously re-appointed. Suggestions were made to celebrate the centenary year by a suitable prize, and a trophy fund was duly started. The usual vote of thanks to the chairman terminated the meeting.

SHOW FIXTURES.—The spring or early summer exhibition of the Reading Horticultural Society is fixed for June 4, and the autumn show for August 27. The Reading Chrysanthemum Society's show has been fixed for Thursday, November 13; and the Richmond (Surrey) spring show is announced for March 18 and 19. The annual show of the Brighton and Hove Chrysanthemum Society has been fixed for November 4 and 5.

ORCHIDS.—Orchids to the number of 1000 from the collection at Blenheim Palace, were offered for sale by Mr. JOHN POPE, of the firm of Messrs. POPE & SOXS, horticultural auctioneers, Birmingham, on the 29th ult. Amongst them were some rare species in flower, and for which there was a keen competition, notably plants in flower of *Odontoglossum Ruckeriaeanum*, and *Cypripedium nitens*. There was a good attendance of buyers, and fair average prices were obtained.

EARLY FLOWERING SHRUBS.—From Coombe Wood, Messrs. J. VERRILL & SOXS kindly send us shoots of various shrubs, viz., *Hamamelis japonica*, Japanese Witch Hazel, the brown calyxes and long yellow filamentaceous flowers in clusters—very singular looking; *H. j. arborea* has dull brown and orange flowers, more densely set on the shoots than is the case with the first named species; *Chimonanthus grandiflorus* with inconspicuous primrose yellow and purple blossoms sparsely set on the young wood. *Amygdalus Davidiana* alba, white flowers showing abundantly on shoots two feet in length; *Lonicera Standishi*, the earliest of the honeysuckles to bloom; *Pieris japonica* (*Andromeda*), now opening profusely its pearly flowers in long racemes; and lastly, *Cydonia* (*Pyrus*) *japonica* Moorlozi, not differing much from *P. japonica*, excepting that the tint is somewhat softer.

M. R. C. AFFOURTIT.—Many of our readers will hear with regret of the death of M. R. C. AFFOURTIT, one of the editors of the Dutch gardening periodical, *Sapereens*, and which occurred on Saturday, February 1, at the age of 65 years.

THE UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The annual meeting of the above society will take place at 8 P.M. on Monday, at the Caledonian Hotel, Adelphi Terrace, W.C.

LELIA GOULDIANA.

We herewith give our readers an illustration (fig. 28) of this beautiful winter flower, taken from a specimen which was in bloom last Christmas, and about the beginning of this year, in the collection of Sir Trevor Lawrence, Bart., M.P., the President of the Royal Horticultural Society, at Barford Lodge, Dorking. The plant in question had ten spikes, bearing together over forty flowers, their bright rosy-crimson sepals, petals, and labellum present a glowing piece of colour which would be attractive at any season of the year; but is doubly so in the middle of winter, when all outside the houses is in sombre garb. The plant, an introduction of Messrs. Siebrecht & Wadley, of New York, has frequently been mentioned in our columns, and its merits fully discussed. *Laelia Gouldiana* is the best of its section which has yet appeared, and it has been found easy to cultivate it in company with its congeners, *L. autumnalis*, *L. anceps*, &c.

THE LATE WILLIAM WILDSMITH.

SINCE the unexpected death of the late John Woodbridge, of Syon, one of our best known gardeners, there has been no member of the gardening fraternity whose decease, so unlooked for, has created more interest or elicited wider sympathy than has that of William Wildsmith, of Heckfield, at the comparatively early age of fifty-two years. Most deservedly ranking amongst our best gardeners, he, by dint of singular energy and force of character, had developed into one of the most widely known. Probably hardly a living gardener is better known than he was, and few will grudge him the reputation. Whilst possessed of some peculiarities which might under other circumstances have developed into marked eccentricities, yet those who thoroughly understood him and realised his singularly energetic character, and fully knew his undoubted goodness of heart, will have no difficulty in admitting that originality and force were in him such marked features as to excuse trivialities or defects not worth dwelling upon. We are rather concerned with undoubted virtues, with unquestioned capacities, and these in Mr. Wildsmith were very marked. His character was eminently impressed on the gardeners where for over twenty-two years he was the presiding genius. Myriads of horticulturists found their way to Heckfield from time to time, and all came away charmed and delighted. The soul of the man was impressed in his work, and that work was some of the best and most perfect to be found in British gardening.

Born at Bradford, in Yorkshire, of which town the deceased sometimes referred to as his "native village," he brought all the acuteness and vigilance of the Yorkshireman into his profession. His first entry into actual gardening life seems to have been in the famous Suffolk gardens of Shrubland, where under a Mr. Taylor he first developed that taste for garden flower-feeding, which displayed itself in such beautiful form later at Heckfield. Later he was at Woolverstone with the veteran Sheppard, who is still there; also at Powis Castle, Welspool, with Brown; after that at Chirk Castle, Denbigh, with another Brown; then at Wynnstay with a gardener named Bell; and finally he went to Heckfield, first as foreman under Dorricehouse, and subsequently under Short, whom he early succeeded as head gardener at Christmas, 1857. That would make his service as gardener to Viscount Eversley first, and later to the Honourable Miss Shaw Lefevre, to have been a little over twenty-two years. It is worthy of note that Mr. Wildsmith survived his esteemed employer Lord Eversley just thirteen months. As was mentioned last week, he was the victim of an accident, which, nearly fatal in its effects at the time, distressingly affected his health always after. Driving home from Winch-

field one dark night when returning from London, the horse shied at some object in the road, turning the cart over, and throwing Mr. Wildsmith and his then foreman, Mr. W. Lees, into a ditch. The younger man escaped unhurt, but the elder one was so injured in the back, that it was long before he recovered; indeed, to the last, the injury then inflicted made him a living martyr to pain. In spite of this affliction, however, his energy never quailed. Enthusiastic in his love for gardening, sufferings which would have proved too much for less ardent men, seemed only to stimulate him to increased exertions, and he worked and went about here and there, and literally everywhere, with an energy which was truly surprising. Only the most exacting of duties or physical weakness kept him from attending the meetings of the Fruit Committee of the Royal Horticultural Society, and of which he long was a member. He also furnished several papers to the Society's conferences and meetings, and was active at the Apple and Pear Conferences, especially also during the past year at the Vegetable and Chrysanthemum Conferences. His admirable abilities kept him in great request as a judge at horticultural shows, and through these engagements apart from his Heckfield friendships, he made numerous acquaintances in all parts of the kingdom.

In years past he often showed how well fruit was grown at Heckfield, and if later he did not compute, it was chiefly because his physical weakness could not bear the strain. The beauty of the flower gardens at Heckfield, and the singularly admirable way in which every department was kept, came to be regarded as household words; and literally people by thousands flocked to see the place during the summer season. There are many far more pretentious gardens than Heckfield is, but none are more beautifully kept. Most happy in his relations with his employers, who entertained for him the warmest regard, he was also exceedingly successful in securing the esteem of those under him, and from Heckfield have gone forth during the past twenty years several first-class gardeners.

Beyond his well-known professional capacity, he was also endowed with exceeding good nature and large-heartedness. For years a subscriber to the Gardeners' Benevolent Fund, on the promotion of the Gardeners' Orphan Fund he threw himself into the work with zeal, and became, as a local secretary, a most valuable helper. We are constrained to say that few gardeners will be more missed than will be William Wildsmith. Shortly after his appointment as gardener at Heckfield he married Helena, daughter of the Bailiff, Mr. Tate, who survives him. He leaves no children.

Few that have had the happiness of the personal acquaintance, or been associated in any enterprises with our late friend, but must pause to express regret at his death, and test to his marvellous energy, and surpassing ability and worth. Ever since the serious eye accident that so severely shattered him some time since, he worked against and mastered physical difficulties that would have vanquished most men, and yet possibly some of his best work in the garden and through the press has been done since his accident. Mr. Wildsmith was as worthy of our esteem as a man, as of our admiration as a gardener. Nothing could move him from his devotion to conviction, truth, and duty, within the domain of social or moral life, nor stop him in his onward progress towards the perfecting of the art of gardening. Whatever he did, he did with all his might, and in his own thorough-going way, seeking the elevation of gardeners and the improvement of gardening. The two objects could hardly be said to be separated in his widely cultured impulsive mind. The better the instrument the higher the work that may reasonably be expected from it, was probably the unspoken formula on which he based his lifelong labours for the elevation of gardeners through temperance, higher education, the best object lessons in the garden, and other

ameliorative agencies. Though we are all the poorer for the loss of such a man, fortunately much of his best work still remains to us in print, and the memory of his taste and genius, and not a little of his most valuable horticultural work at Heckfield, will long live in the minds of his fellows, and will doubtless prove a source of strength and inspiration to the younger men who can hardly fail to have imbibed some of his character and enthusiasm as they grew up into wise men in horticulture, beneath the daily fostering of his wide experience.

D. T. Fish.

NURSERY NOTES.

MESSRS. R. B. LAIRD & SONS.

A VISIT to the Royal Winter Garden Nursery of Laird & Sons' at West Coates, Edinburgh, is a treat to lovers of plants and flowers that may be equalled in a few cities, and surpassed in none out of London. This is especially true in mid-winter—the time when these notes were taken—when the spacious and handsome conservatory abounds in richly varied masses of forced flowers and foliage plants adapted to meet the large requirements of Edinburgh society then at home in the city.

In few establishments is forcing done more successfully than here. The success is due in a large extent to the special fitness of the equipments provided for the work, but the management is also faultless, as may be seen in the perfect specimens of Lilac and of Lily of the Valley and other flowers blooming before their time, and so profusely and tastefully displayed in the great show-house. Lilac, judging from the great number of plants in bloom, and of others in the forcing-houses in various stages of progress, and the large reserve of finely-budded stock standing in a cool-house, waiting to be drafted into the forcing-house, must be a great favourite with the fashionable customers of the firm. It is most in demand, it appears, in the form of cut sprays, and pays well thus, but sells sparingly, and is not profitable when the plants themselves are bought outright.

Behind the Royal Winter Garden are situated the numerous stoves, greenhouses, offices, and workshops of the establishment, in compact and orderly array, in the form of a square. The arrangement is unique in its way. To economise space, the counting-house, boiler-house, packing-sheds, store-house, joiners-shop, coach-house, and stables, occupy the ground-level on three sides of the square. Above these buildings is erected a suite of fine span-roofed plant-houses, the floors of which rest on iron beams, and are rendered damp-proof by cement, so as to prevent water from penetrating to the buildings underneath. Access to these plant houses is obtained from the ground level by flights of steps. Some little extra work is, no doubt, caused by this arrangement of the major portion of the plant houses, but there are countervailing advantages. The site is almost wholly surrounded by lofty dwelling-houses, which, had the plant-houses been built on the ground level, would have overshadowed them more or less in summer as well as in winter. But in their comparatively elevated position they receive a fair amount of light at all seasons, are removed from the influence of dust from the busy thoroughfares that bound two sides of the place, and are, by reason of their dryness and airiness, model wintering houses for the various classes of stock that find shelter in them.

These elevated houses are filled chiefly with hard-wooded plants. One of the first to be entered in the suite, we found, contained an excellent collection of New Holland plants and Ericas in fine saleable condition. Messrs. Laird find a growing taste for these springing up among their customers, and experiencing some difficulty in getting orders made up, even in London, when wanted, determined a few years ago to add a collection of them to their own stock. Two long

houses immediately beyond the New Holland-house are filled with half and full specimen *Azalea indica*, composed of the best of the old and modern varieties. We have rarely seen a more satisfactory collection of *Azaleas*. The plants are models in form, without objectionable stiffness, with foliage deep green in colour, perfectly clean, and every shoot tipped with flower-buds. The north house is a large one devoted entirely to greenhouse *Rhododendrons*, mostly young, and in fine saleable condition; but many also are of half and full specimen sizes. The collection is very complete, and contains the best of the older species and varieties, and the newer hybrids, such as Lord Wolseley, Princess Christian, Scarlet Crown, Williamsii, &c.

The remaining three or four houses in this elevated range are devoted to *Pelargoniums* of the various popular sections, and which are well represented and grown.

The houses and pits on the ground level within the square consist of stoves, propagating-houses, and cool store-houses for miscellaneous stock, and also for Ferns. One, the roof of which was almost covered with a plant of *Lapageria alba*—the mother of hundreds of others in pots which were staged beneath it—in various sizes, from layers recently potted up to established plants in 6 and 7-inch pots. The house contained besides a number of fine *Coriaryne indivisa*. Another house noted was admirably adapted as a plant stove, and contained a splendid collection of *Crotons* and *Dracaenas* in the best possible condition. Selections of these plants are grown, which, being mostly well known to readers of the *Gardeners' Chronicle*, we refrain from particularising. Some fine and rare *Palm*s formed striking objects in this house, viz., *Ceroxylon niveum*, *Livistonia rotundifolia*, and *Astrocarya mexicana*, along with the Palm-like *Pandana*s, *Carludovica elegans*, and *C. Drudei*, each in well-developed plants. In a cool-house hard by my attention was arrested by a fine specimen of the rare and elegant *Dracaena indivisa variegata*, which is certainly one of the most refined-looking and graceful of variegated plants.

Table plants of the most popular kinds, new and rare Ferns, both stove and greenhouse, and miscellaneous flowering stove plants, occupied other houses, which could only be glanced at sufficiently to carry away the impression that at every point there was evidence of enterprise and cultural skill.

PINKHILL.

This branch nursery lies about 2 miles westward from the West Coates and the western limit of the suburb. It may be described as the laboratory of the firm, for here the supplies are chiefly reared for the ornamental departments. Few nurseries, especially in Scotland, are better situated as regards soil, aspect, shelter, and drainage. Some 40 acres have recently been added to the nursery area, so as to enable the extending requirements of the business to be met in a satisfactory manner, and the whole extent of nursery ground amounts to more than 60 acres. It is laid out on sunny slopes, and consists of a fine loamy soil, and is well protected on the north and east by wooded hills. The older part of the nursery in which the houses, to the number of about fifteen are built, was to the enthusiastic florist of twenty-five or thirty years ago a horticultural treasure house, and to which he was wont to journey annually for the newest and best *Hollyhocks*, *Dahlias*, and other floral gems. Florists' flowers are still a speciality of the firm, but to a lesser extent than formerly.

The ground formerly devoted to them is now occupied by shrubs and trees, and amongst them are some rare *Conifers* that are often regarded as being unsuited to the climate of Edinburgh, but which thrive well here. All the forms of *Hetiospora* are luxuriant and of perfect colour: *Abies grandis* and *Picea lasiocarpa*, *P. Parryana*, *Pinus aristata*, and others of similar constitution exhibited vigorous and well matured growth. *Olearia Haastii*, which is not one of the most successful plants in these parts, was noted in an open grassy glancing as vigorously as young

Thorns, and the unusually large stock on hand of the plant, young and old, suggested that there must be a considerable demand for it for planting in suitable quarters.

About 8 acres are devoted to fruit trees, of which there is a very healthy stock of varieties of Apples, Plums, Pears, and Cherries, in the open quarters, while on the long stretches of walls were Apricots and Peaches, of good form and in fine health.

The houses are chiefly adapted to propagating and growing on young stock, and forcing flowers. Young *Palm*s, such as *Kentias*, *Arecas*, *Scaevothias*, and others, best suited for table decoration, are reared here in large numbers.

Chrysanthemums—of which about 5000 are grown annually for the cut flower trade of the firm—are also largely propagated to meet extensive plant orders, especially in new and scarce varieties, and potting for these purposes was being actively pushed on at the time of my visit. In one lofty house in which hardy flowering shrubs were being forced, noble specimens of *Rhododendrons* Sir Joseph Whitworth, *mauclosium*, *Auguste van Geert*, *Michael Waterer*, *Prince of Wales*, &c., were being pushed into flower. They were freely set with buds, and averaged 10 to 12 feet in height.

Imantophyllum, in all the improved varieties occupy a large space. They are being found valuable as room and corridor plants, either in or out of flower. Their characteristic style of foliage, and their disregard of draughts, and even drought, when growth is finished, render them favourites with those who have once given them a trial. But I must close with the remark that my visit to these excellent nurseries afforded as much pleasure as instruction, and cannot fail to do the same to other southern visitors to Edinburgh. *B. S.*

PLANTS AND THEIR CULTURE.

THE PLANT STOVE.—The temperatures given for last month, viz., 60° at night, with a rise of 10° by day, will still apply generally, and especially in cold sunless weather; and it is not safe to keep the warmth too high, for fear that we may have severe weather, with cutting winds, during February. Admit, when it is safe to do so, a little air about noon, it being of great benefit to the plants. Preparations should now be made for re-potting and top-dressing, but ere the work begins everything required should have been got in readiness, such as soils, which should have been got under cover some time ago, and suitable composts prepared for the different kinds of plants. When everything is ready, the work of potting, &c., is much better done in the houses than in the potting-shed if that be far away. Over-potting, should be most carefully avoided, especially of *Palm*s and similar subjects. I have often seen these plants in pots double the size they required, and in such cases the ill-health induced was fatal to them. Let beginners anxious to grow their plants quickly take warning, and not afford a plant a larger shift than is really required. It is also advisable, when practicable, to take one genus of plants, and repot or top-dress them, as by this method of doing the work, the potting material employed can be slightly varied to suit different requirements. Most hard-wood stove plants and *Palm*s require to be firmly potted, and the drainage to be carefully put into the tubs and pots, clean pots and crocks being employed. If a doubt should exist as to the desirability of shifting a plant, it is much better not to repot, but to carefully supply manures to such.

Dracaenas, *Palm*s, *Eucharis*, and *Crotons*, should have bone-dust added to the compost, and a few half-inch bones should be placed above the drainage; and for quick-growing plants, like *Caladium*s and *Gloxinias*, some decayed manure should always be added to the compost.

Crotons should have a large percentage of good, fibrous, yellow loam, and bones in the compost, and all old ties and stakes removed and made good at this time. *Marantas*, *Ixoras*, and *Dipladenias* need a large proportion of peat and some lumps of charcoal, with plenty of coarse silver sand. Any plants deficient in roots should be induced to make roots by

the aid of mild bottom-heat. This plan cannot always be adopted in the stove, but a small pit or forcing-house may be utilised for the purpose. Carefully water all repotted plants, and keep the stove rather close for a time, and when all the work is done the warmth may be slightly raised, both day and night, and in fine weather, the air of the house should be kept moist.

Any climbers in the house should have some new compost added to the borders or pots in which they are growing, and the top growth should be regulated, and new ties given. The glass and woodwork should be thoroughly cleaned, and the house re-arranged. A few pots of early *Gloxinias* may be started, also *Achimenes*, if required early, but they are best later on, if not specially required. The *Gloxinias* should get bottom-heat to start them. *G. Wythes*, *Syon House*, *Brentford*.

EPIPHYLLUMS, AND THEIR PROPAGATION (FIG. 29).

THESE are the most generally grown and the most useful genus in the large family of *Cactuses*; and considering the ease with which they can be grown and multiplied, it is not surprising that they should be found in gardens where few others are cultivated. Moreover, they flower in winter, and can be had in flower practically when they are required. As is well known, small pieces of the branchlets root readily in the ordinary way as cuttings; but owing to the loose trailing habit of the plant, unless they are then grown in baskets or otherwise elevated, such plants are not seen to an equal advantage, as when they are grafted on stocks from 9 to 18 inches high. Although they can be readily grafted on almost any member of the *Cactus* family for general purposes, the strong growing *Pereskias* are considered to be the most suitable for tall specimens. *P. Bleo* is best, being a stronger grower than the more commonly employed *P. aculeata*. The operation itself is exceedingly simple, indeed, so much so that the operator may indulge in any fashion which may suit his purpose, with an equal certainty of success, provided he firmly secures the graft in an incision made in the stock. The entire length of the stock may be grafted with branchlets, but as I believe that standards are the most effective form to grow, a few pieces inserted round the top of a stock, with one good piece as a terminal, will be sufficient—or perhaps a terminal bit alone.

After having detached suitable pieces from the parent plant, make the base of the branchlet slightly wedge-shaped, and with a sharp knife cleave the crown, and make as many longitudinal slits in the stock as there are pieces to be grafted. The slits may be held slightly open with the blade or handle of a budding-knife while the grafts are being put in; and the tension of the stock is often sufficient to keep them in position without any further fixing; but a handy and ready means of fixing them is by transfixing them with one of the *Pereskia* spines; or, failing that way, they may be tied on. It is not necessary, nor even desirable, that the stocks be rooted before being grafted. Not only does previous rooting involve a loss of time, but the strong, ripened shoots of the last growth are in better condition for working than when further solidified during the process of rooting.

Cut up the shoots to the required length, then insert the number of grafts thought desirable in the manner advised, and pot each stock in a small pot, placing them all in the propagating house or in any fairly moist pit where the temperature ranges about 65°, and where in the course of a few weeks the stocks will have rooted, and the grafts become united to them. In order to make the most of them, they should soon afterwards be shifted into slightly larger pots, and tolerably larger heads may be grown in 48's. It is advisable to afford the plants a temperature of about that recommended for propagation, when, if all goes well, they should make nice decorative plants in the space of one year. As the autumn approaches, less heat and moisture must be given, and at the same time more air, until they are

in a state of comparative rest, when a temperature of 50° would be ample. From quarters such as these the plants may be brought on into flower in succession by putting them into more warmth. After the plants have done flowering, growth should be encouraged in the manner advised for the previous season.

The *Pereskia* is a vigorous rooting plant, and, with ordinary care, may be kept in good condition for several years; but when the heads get large and top-heavy, it is advisable to break them up for stock. Although the Cactus is not particular as to soil, a compost of good loam with enough sharp sand mixed in it to render it porous, and a good sprinkling of old lime mortar-rubbish, is a good mixture. The drainage should be good. Either of

truncatum, but the prevailing colours are shades of red or rose, sometimes nearly white, and others with violet-purple markings. *E. Russellianum* has been ranked as a species; it is a distinct and desirable plant, especially the form called *E. R. superbum*. Another distinct form, with stellate flowers like a *Cereus*, and supposed to be a garden hybrid, is *E. Gartneri*, which I believe to be the same thing as the plant introduced as *Makoyanum*; it is a very desirable plant, and should be included in every collection of *Epiphyllums*. When these plants are grown on their own roots considerable care must be taken not to overwater them, as they are strictly speaking leafless, succulent plants, few of which require much water, particularly when in a low temperature. *F. R.*

possible) of each sort of *Viola* be planted together in short lines, as a better idea will thus be arrived at, for what particular purpose each sort is best adapted; for instance, some which are of dwarf, compact habit, should be chosen for edging or lines, while straggler or straggling growers would be more useful for massing, or to furnish cut flowers. The time is at hand when the planting of *Violas*, where they are intended to flower through the summer, must be performed. I should advise early planting—say in March—if the weather be favourable, so that the plants may obtain good hold of the soil before the warm weather commences. In cases where *Polyanthus* or other spring flowers occupy the beds the *Violas* are intended to fill during the summer, the best result will be obtained by taking the *Violas* out of the beds where they have been struck, planting them in a border, at about 4 inches apart. Then, in May, when the beds are cleared of the spring bedding, carefully transplant them, with as much soil as possible, into their summer quarters; and if the weather be dry at the time, give the soil a thorough watering, and, if possible, a mulching also. The *Viola* should especially commend itself to those who have a large flower garden to furnish, and but little glass accommodation, as the plants require no protection during the winter. *T. F. D., Valentines.*

PEACH DYMOND.—In the Mote Park Gardens, Maidstone, I recently had the opportunity of viewing a very heavy set of fruit of the above variety of Peach. This Peach has been referred to in these pages by different gardeners as being excellent for cultivation out-of-doors; but Mr. Davis speaks of it as being a good forcer. I was told that it had cropped constantly for several seasons at the Mote, and last year about fifteen dozen of fine large fruits were gathered early in May. The tree promises to be equally prolific this year. The variety has a hardy constitution, resists mildew better than some others, and promises to become still better known and grown both indoors and out. *H. Markham.*

SAMBUCUS RACEMOSUS.—The plant which is here, was raised from seed gathered by me in the Albulia Pass, Switzerland, in September, 1868. It grows freely in the lower part of the pass in open spaces amidst Pine woods, and is covered with red berries, so as to resemble masses of pink coral. I had the privilege of an introduction to the late Professor Heer, of Zurich, from whom I learnt the name. It was planted in a similar position here—an open space between Scots Fir. Unfortunately the soil is very dry, and, though it grew well and flowered, I have only twice seen a few small bunches of red berries, and, therefore, destroyed the shrub some years ago. Since the correspondence in your columns I have noticed three seedlings. A dead Scots Fir has been uprooted which opened the soil nearly 1 foot deep. Potatoes were grown last year with dung and lime, and this year I have planted one of the seedlings, and hope for a better show of berries in a few years. To give you an idea how dry the soil is, there was a *Picea Nordmanniana* growing well, but it came to the front too much in a border where there are bulbs and small shrubs. It was decided to lit it and move it further back. My man dug around it, and could not find any roots until 3 feet below the surface, where a tap root which was much the same size below the ground that the trunk was above began to spread out, so the tree, which was 15 feet high, was destroyed. The root appeared to have gone down in search of moisture. I have no doubt that berries form on the Elder, but we have so many songsters here—a great contrast to the silent woods in Switzerland. *H. R., R.N.*

FIG. 29.—EPIPHYLLUM TRUNCATUM GRAFTED ON A PERESKIA STOCK. (SEE P. 172.)

the *Pereskias* named will make shoots in a season, about 12 or 14 feet long, so that comparatively few plants will suffice for a large number of stocks. Indeed, as an intermediate-house climber, these, when grafted their full length, make handsome objects when in flower; and if only wanted for cutting, a large quantity of flowers can be cut from such plants. *Epiphyllums* are also capital subjects for planting on rustic walls, in a similar way to that often practised with Ferns, but they dislike much decaying material about their roots, preferring to cling rather closely to the wall, with just enough covering over the roots to prevent their being dried up; of course, in this case there is no need for grafting, but plant goodly-sized pieces, and see that they are firmly fixed in position. There are a great many varieties of *Epiphyllum*, mostly of the species

HOME CORRESPONDENCE.

PANSIES AND VIOLAS.—Amongst the names of florists' flowers to put on trial at Chiswick during the present year, I was pleased to find Pansies and *Violas* specially mentioned. These subjects are really beautiful, and will well repay the grower for any attention he may give them. I hope that some of the growers from the North who cultivate them extensively will send good collections, so that we may have an opportunity of seeing what may be termed a representative collection. Beautiful as the Pansies are, I think the *Violas* are of more consequence, being so much more valuable than those for bedding purposes, having also colours that are more decided, and flowering more freely. I would suggest that not less than six plants (more if

OUTDOOR BULBS AND THE BULB MITE.—Gardeners, myself included, are often contributing their experience to your valuable paper with respect to their successes and failures in cultivating the *Eucharis* after they have been attacked by the mite. I find you add a foot-note to your correspondent, "W. H. Stephens," January 25, wherein you state with great truth, "The mite is common on other bulbs." But I do not remember ever reading any correspondence on the above heading. I am well aware that the following species of bulbous plants are subject to its attack, viz., *Eucharis*, *Amaryllis*, *Valottas*, *Pancratiums*, &c. But the attack of the mite on the outdoor species of bulbs was unknown to me until last spring, when on taking up a quantity of *Hyacinthus*, *Tulips*, &c., which had been planted very deep, and which had each year become weaker,

and the blooms smaller in consequence. I attributed this to the deep planting, as I thought the bulbs did not come to that state of maturity which is essential for good blooming. I found a great many of them decayed, and on examining them I found, by the aid of a lens, that they were infested with the mite; in fact, some of the Hyacinths were partially devoured by them. I had the bulbs conveyed to the kitchen garden and washed in the same composition, and treated in every way as recommended by me for the Eucharis in a previous number of the *Gardener's Chronicle*, and afterwards laid out in the full sun, allowing them to remain in that position for a month, when they were stored in drawers until again required for planting. I found at planting time that these bulbs were in a sound and ripe condition, and not a single mite was perceptible. The bulbs which were the worst infested had previously been selected and thrown away. Thinking possibly there might be some of the deprecatory bits in the beds, a good dressing of lime and soot was given them before digging the beds, and a pinch of the same mixture was put into each hole when planting the bulbs in the autumn, as I find this is the best remedy for maggot and grub-infested land. I therefore strongly recommend your correspondent, "D.," to try this simple remedy for his Narcissus bulbs, which are attacked by the Narcissus-fly (Merodon Narcissi). Just as the bulbs were peeping through the soil, I took out a few of them, and found they were in a satisfactory condition. *Alfred Bishop.*

HARDY FRUIT CULTURE.—Your comments upon the course proposed to be taken by the Fruiterers' Company in relation to the disposal of its after all very small subscription sum of £1600, fully justifies my strictures upon an absurd proposal made at the Fruit Conference, held at the Crystal Palace last October. There, when it was proposed to give the Fruiterers' Company a vote of thanks for what it proposed doing, and suggested that the vote was far more fitly due to the Royal Horticultural Society for what it had done in relation to fruit culture. Now after an immense amount of bunkum has been uttered in regard to the grand purposes of the Society, we learn that the sum it has collected—only £1600 out of the expected sum of £5000—is to be handed over to the Royal Agricultural Society—of all bodies—for disposal. Nothing could be more absurd, because the Royal Agricultural Society cares no more for fruit culture than for flower culture, and as a body, it is almost absolutely ignorant of what is fruit culture. If the money is to be expended in prizes for orchards, &c., it will be simply squandered. It is not prizes but practical teaching which the farming element needs, and if the fund could have been large enough to establish a travelling fruit lecturership, no doubt great good would in that way be accomplished. But it would require a big sum to found that desideratum. The best thing, therefore, would be to utilise the sum thus raised for the purpose of spreading broadcast such information on the subject as may be available for the benefit of the farmer, small amateur, and cottager sections of the community, Mr. Wright's prize essay, Messrs. Eyre & Spottiswoode's new hardy fruit pamphlet, Mr. Badgers' prize essay of several years since, Sir J. Paxton's *Cottagers' Calendar*—in fact, there is no lack of cheap books which, written specifically for the class to be instructed, might prove most valuable aids in promoting a knowledge of fruit culture, and inculcating a love for it also. *A. D.*

THE GARDENERS' PROBLEM.—Allow me another word on this subject. Surely the reason why it is impossible to imitate in our gardens the conditions under which plants grow in their own countries, is to be found mainly our inability to make the climate suitable for many of the plants we attempt to cultivate. How is it possible for us in the open air, with a range of temperature extending to some 50° Fahr., to imitate the climates of Central Asia or North America, with an "extreme range" of something like 100°? Yet here, where the temperature very rarely goes below 20° or above 80°, Pentstemon (natives, I believe, of Central North America) flourish in a way which can hardly be exceeded in their native country, growing into bushes with a strong woody stem, and living for many years in the open air. On the other hand, to show the effect on some plants of an apparently trifling difference in climate, the following fact is instructive. On the old heaps of waste from the lead mines near Buxton, *Parnassia palustris* (Grass of Parnassus)

grows abundantly even on the steepest slopes. Go some 50 miles to the west, and try to grow this plant on the precisely similar mine waste heaps on Halkin Mountain in Flintshire (which, like the Buxton hills, is carboniferous limestone), and the chance of success, if the plant be left to Nature, will be very problematical. But go the foot of the Flintshire hills, and there on flat marshy ground at the level of the sea at Mostyn, you will find Grass of Parnassus in abundance. What causes the difference between the two localities? Simply (so far as I can see) this—the rainfall at Buxton in 1888 was 46 inches, while at Halkin it was only 29 inches. *Alfred O. Walker, Noddy Glyn, Colwyn Bay.*

THE ROYAL HORTICULTURAL SOCIETY'S REPORT.—There is one little item in the report just to hand which merits attention, and shows in a marked degree the wisdom of reducing the rate of annual subscription to those who may wish to become guinea Fellows. During the past year, 93 Fellows have withdrawn through death or resignation. On the other hand, no less than 265 new ones have joined. Thus the balance in numbers is no less than 173. But that is not all, the loss of income arising from deaths and resignations is £135 2s., the gain £341, a balance of £206 to the good. But even further, the accession of new Fellows shows the amount to be curiously enough exactly £128 2s. from two-guinea Fellows, and £212 from one-guinea Fellows—ample evidence that the society must henceforth view as the backbone of its income the smaller subscriptions. *A. D.*

VANDAS.—In your last number, Mr. Douglas has a very interesting account of the Vandas at Messrs. Williams & Sons' nursery, Holloway. It is also an article treating on the cultivation of Vandas generally, but Mr. Douglas has a sentence or two in it that I think require qualifying. It is an odd saying, that doctors often differ, but a comparison of opinions on any subject can do no harm, but the opposite. The first sentence I mean is, "Vandas require but little shade," and here I differ entirely from Mr. Douglas. This may do in a smoky atmosphere in the neighbourhood of London, but in a clear country such as we have here a week of such treatment would suffice to turn the greenest plants possible into sickly, leggy, yellow things. We have here a house full of Vandas—about eighty good plants—this house, from its situation, never sees the direct rays of the sun, and in summer we shade heavily. The plants are here to speak for themselves, as green as may be, and leaves down to the pot. I know of several collections of Orchids, where Vandas are but a name, and simply from too free exposure to the sun. There is another thing that I would like to mention in regard to the cultivation of Vandas, and I think Mr. Douglas does not do so, that is, in potting a Vanda do not fill the pot full of crocks to within an inch of the top, let the roots go down amongst good clean sphagnum mixed with a few small clean crocks, and they will do far better than if hoisted up on a stone depot, as I have often seen done. The month of September is the safest time to overhaul Vandas. Another thing in regard to Vandas losing their leaves: nothing makes them do this quicker than by leaving the spikes of flower too long on the plant. I always have them cut off as soon as possible after being open. The finest form of Vanda suavis is one, I think that Mr. Williams sent out, called V. suavis Gottschalkii, large in spike, fine, bold, well-spotted flower, with a very deep pink stem. I quite agree with what Mr. Douglas says about temperatures, &c., and I hope he will pardon me questioning his views about shading. *W. Thomson, Jr.*

NARCISSUS FLY.—Having noticed your answer to "D." in your issue of January 25, with illustrations page 118, of the Narcissus fly (Merodon Narcissi), in its various stages, perhaps the following additional information will be of use to him and many other readers of your journal. The bulbs of the Daffodil and of other species of Narcissus frequently refuse to vegetate, the usual cause being that the interiors of the bulbs has been eaten by the grub of the two-winged fly known to entomologists under the above name. The only way to avoid this disappointment is to examine each bulb before planting in the month of November, when on the outside of the bulb, in the manner depicted in your diagram, will be found one or two comparatively large, round holes. The bulb upon being cut open will be found to be more or less decayed, owing to the maggot

(fig. 2 of the diagram) having sustained itself on the substance of the bulb during the summer and autumn months. This larva, upon close inspection, will be found to be somewhat like the flesh maggot, and not unlike a sheep bot, only that it is not furnished with spines, and instead of being whitish, its natural colour, it is changed to brown, owing to its having lived amongst the slimy matter which it has exuded, and which chiefly is one more cause of the rotting of the bulb. Towards the end of November the maggot is transformed into a pupa (fig. 3 of diagram), and it then eats its way out of the bulb near the roots, and it then buries itself in the adjacent soil. The pupae are dull brown in colour, egg-shaped, rough, and strongly wrinkled. In this state they remain until the following spring, about April, when the flies (fig. 4 in the diagram) issue forth. The fly again deposits its eggs upon the bulb, generally near the base of the leaves. The flies are very much in appearance like bumble bees, the colours being for the most part yellow, orange, and black; and they also bear a strong resemblance to the bot flies. However, they are readily distinguished from bees, in that they have only two wings; the horns and proboscis also are totally different, whilst again they have no stings. *Bernard Wilson.*

EARLY FLOWERING OF THE HAZEL.—I arrived here on the morning of the 31st ult. Walking round my garden, I was much struck by the early-flowering of the Hazel bushes. The catkins were out in great force, and the female flowers in bud in abundance. To-day they are for the most part out with their beautiful red blossoms. Not having lived here at this season since June, 1882, I cannot speak as to the intermediate years, but I recollect well how early the Hazel Nut was in flower that year. The thrush and blackbird were in full song on the 31st, and I heard the note of the bullfinch, though I did not sight the bird. *J. A. C., Northfield, Amman, Feb. 3.*

PASSIFLORA CERULEA.—The other day when passing up the High Street, Goldingmy, my attention was arrested by a specimen of this plant which has nearly covered the front of Dr. Parsons' house; and although the flowering season is long since passed, the plant had a large number of yellow, plum-like fruits. I question whether the fruit is not even more ornamental than the flowers. At all events, as viewed from the street, nestling as they do amongst the dark green foliage, the fruits are more conspicuous than those, and add greatly to the ornamental character of this plant. It is a curious fact that the best specimens of this plant which I remember to have seen were in or near busy thoroughfares. And I may mention another notable example on a house near the High Road, Chiswick, where the fruits were frequently very conspicuous during the winter. *F. R.*

MOUND CAVES AT HEATHERBANK.—Those of your readers who like out-of-the-way devices in gardening, as I do, may care to hear of the results from our little mound caves of which I wrote in the *Gardener's Chronicle*, December 18, 1886, and will I hope experiment in the same direction. The first caves were built with too small pieces of stone, so after showing that the greenhouse Ferns such as *Adiantum canalicatum* and *Pteris acrostichum* would stand the cave, the roof began to drop in. These were planted in February, 1885. We made a new series of mound caves and planted them in October, 1887, these had one large stone for each side, back, and roof; they have stood well, and the greenhouse Ferns in them are now green, and both have seedlings all along the sides of the stone, showing that they are all quite at home. In another set of caves, *Cyclamen meophyllum* is thriving, and a number of different varieties of *Adiantum* are planted, but have not yet had time to establish themselves. I have tried a good many bulbs and tender Primroses, but these failed, I suppose from insufficient light. There must, I think, be many plants which would succeed as well as in a greenhouse. In very cold weather a slab or slate may be used across the mouth of the caves. *George F. Wilson.*

EVERLASTING PEAS.—In the hardy flower way, this is very useful for making a fine display, and for cutting. The more valuable are the white, which looks well in the foreground of shrubs, or in the borders of perennials, and the purple-flowered, which is a stronger grower. A good plan of employing these Everlasting Peas is in clothing the stems of trees that have not much top growth. A piece of

large-meshed wire-netting should be placed round the tree, and to this the plants will attach themselves. In borders, a few stout branches with the twigs and sprays attached are the best kind of support, and to these the plants should be allowed to cling as soon as they begin to grow. These Peas are raised from seeds, or increased by divisions early in the spring. To give these a good start, large holes should be thrown out to a good depth, and manure placed at or near the bottom, refilling the holes, and afterwards putting in the plants, and making the soil firm; seeds are best sown as soon as ripe in sandy soil under hand-lights. J. S.

CATS IN GARDENS.—Your correspondent, F. S., will find that if he requires a cat for his garden he will have to train up a kitten, and accustom it to wear a collar, and sometimes to be tied up. The kitten in time will take to this just as a dog does. Some years ago I trained two kittens in this way, as a protection to my Strawberry beds, Peas, &c. They were attached by a ring to a length of wire as in fig. 102, p. 725, vol. vi., and the mother was tried at first, but as "F. S." says, she was not amenable to discipline and confinement. W. L.

ROSE STATISTICS.

(Continued from p. 89.)

LIST X.

The Hardest Test, being L. VILLI, and L. VILLI.

Table with 2 columns of rose names and their corresponding statistics (Best, Middle, Worst).

raised from cuttings, and therefore growing solely on their own roots, as compared with plants budded on the Briar Seedling or Briar cutting, is very remarkable. It appears to be pretty generally agreed that "Own Root" plants take much longer to obtain, and when obtained, give inferior blooms. Some few, however, prefer "Own Roots" for very strong growers like La France, Ulrich Brunner, and the Duke of Edinburgh family. Some of the Retarus remark that budded plants become "Own Roots" after two or three years from planting, and this is, in a sense, no doubt true, especially when the stock used is the Manetti; but when the union between bud and stock has once been good, although the Rose will make roots of its own above the union, and be so far an "Own Root," yet it will at the same time continue to draw nourishment for very many years through the stock roots also. The present Returns, therefore, advise us to continue to bud Roses, as not only being a quicker and easier method of propagation, but as also giving us better flowers.

In this summarising and interpreting, to the best of my ability, the results of the returns sent in, I have endeavoured, as far as possible, to refrain from the expression of any single personal opinion, either of my own or of others; but I think it will be of interest to many to have before them the following note on stocks, which was enclosed in the return of Messrs. Cocker, of Aberdeen.

I have ventured only to add up Messrs. Cocker's list of experiments with forty-six varieties, with the following results:—

Table with 3 columns: Variety Name, Best, Middle, Worst.

Similar experiments, carried out on a sufficiently large scale, in other places would give us very valuable results. W. Walks, in Journal of Royal Horticultural Society.

LAW NOTES.

STRAWBERRY GROWING IN YORKSHIRE.

HARVEY v. LOIS KIRBY.—A good deal of interest has been created amongst fruit-growers in Yorkshire by a singular partnership dispute, tried at the Driffield County Court, in which Mr. Harvey of Hutton Cranswick, an extensive Strawberry-grower, brought an action under seven heads, against Mrs. Lois Kirby, a large farmer at Scurf, near Great Driffield, the plaintiff claiming (1), dissolution; (2), accounts and inquiries; (3), a receiver and manager; (4), damages for breaches of the terms of partnership in neglecting to manure, and refusing to permit him to clean and look after the plants; (5), payment of whatever sum may be found due to the plaintiff on the taking of the necessary accounts; (6), in the alternative a declaration that he is entitled to a share of the profits for the year 1889; (7), such further or other relief as the case may require. The case first came on for hearing in September last when Mr. Kemp, barrister (instructed by Mr. Cooper of Beverley), appeared for the plaintiff, and Mr. Trigg (Jennings, Wigmore & Trigg), of Driffield, represented the defendant.

The particulars, as stated by counsel and witnesses, showed that in or about September, 1883, the plaintiff and defendant through her son entered by verbal agreement into a partnership in respect of the growth of Strawberries on land belonging to, or in the occupation of, the defendant, and the sale of the same, the defendant to allow the use of her land, provide manure, put in order, and give assistance for the rough work with her men and horses when required, the plaintiff to provide the Strawberry plants, clean and look after them, and sell the fruit, the profits arising from the sale to be equally divided. The partnership was carried on year by

year up to and including the year 1888, but no settlement or statement of accounts had been made or come to between the parties since that time, the defendant refusing to come to any final settlement. Evidence was heard at great length, and in the result. His Honour, Judge Bedwell, ordered an account to be taken by Mr. Tonge, the Registrar, between plaintiff and defendant, with special instructions, the plaintiff to have his costs up to decree, with costs of counsel.

The case came on again at the Court recently, when the Registrar produced the accounts, and His Honour gave a verdict for plaintiff for £149 1s.

THE ALPINE GARDEN.

PRIMULA DENTICULATA ALBA.

This variety is by no means so devoid of beauty as was at first supposed, on seeing a weakly plant in bloom. It proves to be, however, a valuable addition to our spring flowers, with a constitution quite equal in vigour to that of the type. The large snowy-white balls of flowers are very sweet and attractive, and, if anything, they are a little earlier than the other forms of the species. It proves quite hardy in the open air, but to ensure full development of its delicate flowers, the plant should be covered with a light or other protection on the approach of boisterous weather. It may be propagated like other plants of the type, by simply cutting or tearing up the old crowns, and replanting the pieces in a free and rather rich soil.

PRIMULA OROBONIA.

No excuse need be offered in again referring to this handsome Primrose, which has already taken firm root as one of the best of our winter and spring-flowering subjects. It flowers with profusion, and, if treated liberally, for so long a time as to be hardly ever without bloom. The improvements in size of flower and in depth of tint have been very striking, within the last few years; and if the process of selection should go on, we may expect many valuable additions, and some, perhaps, capable of being cultivated in the open air. It seeds very freely, and if seeds are sown when gathered, no trouble will be experienced in raising plants. Its poisonous properties have not made themselves manifest to me, at least, and I have handled the plants in every way in the course of potting, trimming, and staking, with no bad result whatever. This, of course, does not prove that the plant may not cause irritation to others. D.

PRIMULA AMENA.

After enquiring in vain everywhere for three or four years for Primula amena (M. Biehestein, Bot. Mag., t. 3232; E. Boissier, Fl. Orient., iv., 26), I am afraid it is lost to English cultivation. Boissier described it as an intensely purple Oxlip. I find it mentioned in several modern books on gardening, as if it was a common plant; but P. cortusoides var. amena is confused with it. Most of the Caucasian plants are so easily cultivated in England, that it is a pity this should have been lost. Perhaps someone who reads this may still possess it. C. Wolley Dod, Elgje Hall, Malpas.

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending February 1, is furnished from the Meteorological Office:—

"The weather was very rough, squally, and wet at the commencement of the period, but subsequently became much quieter than of late, although it remained unsettled and dull generally, with rain at frequent intervals. At some of our more northern stations slight falls of snow were experienced.

"The temperature has been above the mean in all districts, the excess having ranged from 1° in

BRIAR SEEDLINGS OR BRIAR CUTTINGS FOR STOCKS.

Judging from the opinions expressed in the Returns, it appears that, other conditions being equal or unknown, there is absolutely nothing to choose between seedlings and cuttings, for Rose stocks; yet each has its particular merits under certain conditions. Given a good deep rich well-drained soil, or a dry sandy or chalky soil, the seedling seems to be preferred. It roots deeper down into the soil, and can therefore better withstand the summer drought. The cutting, on the other hand, appears to be the best for shallow or heavy soils, or for damp, ill-drained positions. It roots somewhat nearer to the surface, and makes a fibrous web ready to absorb the surface feeding given; it is also more readily affected by the warmth and light of the sun. The cutting has another merit in the eyes of many, in that it is easier to bud on it, than on the seedling. It is said by some that the cutting also gives earlier and somewhat larger blooms, to which others reply, "But the seedling lasts the longer." In deep warm well-drained soils, therefore, or in over-dry ones, our "Returns" counsel us to choose the seedling, and in heavy or damp soils to choose the cutting, but in other cases seedling or cutting are good alike.

MANETTI OR BRIAR AS A STOCK.

Manetti does not find much favour; some, however, consider it better for light soils and for strong growers, and some think that for such it is immaterial which stock is used. The Briar, however, is insisted on as an almost absolute necessity for Teas and weakly growing H.P.'s. Manetti is said to give earlier blooms, and therefore if used partially, together with Briar for the main crop, it affords a longer succession of bloom. The consensus of opinion is decidedly against Manetti for heavy lands.

VALUE OF "OWN ROOT" ROSES.

The general agreement on the inferiority of Roses

Ireland and 2° in Scotland, N., 'England, E.,' and over the western parts of England, to 4° in the west and east of Scotland and in 'England, S.' The highest of the maxima were recorded on somewhat irregular dates, and ranged from 52° in Scotland, N., and 'England, N.W.,' to 57° in 'Scotland, E.,' and 'England, N.E.' The lowest of the minima, which were registered either on the 26th or 30th, varied from 24° in Ireland to 30° in 'England, N.E.,' and 'England, S.,' and to 40° in the 'Channel Islands.'

'The rainfall has been less than the mean in the eastern and western parts of Scotland and in 'Ireland, N.,' and about equal to it in 'Scotland, N.,' and 'England, N.E.,' in all other districts an excess is shown.

'Bright sunshine' has been less prevalent, as a whole, than it was last week, the percentage of the possible amount of duration having ranged from 13 to 26 in the Scotch districts, from 16 to 17 in Ireland, and from 14 to 31 over England.

[By the term "accumulated temperature" is meant a figure representing the aggregate amount, as well as the duration of the excess or defect of temperature above or below 42° Fahr. for the period named; and this combined result is explained in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns: DISTRICTS, TEMPERATURE, RAINFALL, BRIGHT SUN. Sub-headers include Above (+) or below (-) the Mean for the Week, Accumulated, Day-deg., etc.

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—1, Scotland, N.; 2, Scotland, E.; 3, England, N.E.; 4, England, E.; 5, Midland Counties; 6, England, S. Principal Grazing Sc. Districts—7, Scotland, W.; 8, England, N.W.; 9, England, S.W.; 10, Ireland, N.; 11, Ireland, S.; 12, Channel Islands.

MARKETS.

COVENT GARDEN, February 6.

[We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered, that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. Ed.]

Our market now presents as dull an appearance as we have seen for many years past, scarcely anything being on offer beyond Grapes, which comprise only a few samples of first-rate quality, and which are speedily rising in value. Foreign goods consist principally of Reinettes, of Grise from France, Pineapples from St. Michaels, and Tomatos from Canary Islands. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with columns: s. d. s. d., Apples, 2-sieve, 6-8-0; Lemons, per case, 12 0-20 0; etc.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with columns: s. d. s. d., Asparagus, English, per 100, 8-0-10 0; Mustard and Cress, punnet, 0-4-0; Beet, red, per dozen, 1-0-0; Parsley, per bunch, 0-6-0; etc.

J. B. Thomas.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with columns: s. d. s. d., Arealia Sieboldi, doz., 6-0-18 0; Erica, various, doz., 8-0-24 0; Ferns, in var., per dozen, 4-0-18 0; etc.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns: s. d. s. d., Abutilons, 12 bun., 2-0-4 0; Narciss, paper-white, French, doz. bun., 3-0-6 0; Acazias, doz., 0-9-1 6; French, doz. bun., 3-0-6 0; etc.

ORCHID-BLOOM IN VARIETY.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter), for the week ending February 1.—Wheat, 30s. 1d.; Barley, 32s. 2d.; Oats, 18s. 6d. For the corresponding period last year:—Wheat, 29s. 9d.; Barley, 29s. 7d.; Oats, 16s.

SEEDS.

LONDON: Feb. 5.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, London, report that there is now a fair reasonable demand for field seeds. Scarcity still prevails for choice English Red Clover seed, while ordinary qualities are cheap and plentiful. Rather more attention is being devoted to Trefoil, Alsike, and white remain firm. Very low prices are asked for Italian and perennial Ryegrasses. Bird-seeds are dull. Blue Peas, trade quiet, but steady. Haricot Beans continue cheap and good.

FRUITS AND VEGETABLES.

SPITALFIELDS: Feb. 5.—Good supplies of all kinds of green vegetables. Short supply of English and foreign fruit, &c. Demand very quiet for all sorts. Market glutted with Potatos. Prices:—English Apples, 4s. to 7s. per bushel; American do., 16s. to 21s. per barrel; forced Rhubarb, 1s. 3d. to 1s. 9d. per dozen bundles; Savoys, 2s. to 3s. per tally; Brussels Sprouts, 4d. to 8d. per half sieve; Spinach, 1s. to 1s. 6d. per bushel; Turnip-tops, 1s. to 3d. per sack; Sprouting Broccoli, 1s. to 1s. 6d.; do. 3d. to 1s. per sieve; Seakale, 1s. to 1s. 6d. per punnet; Curley Kale, 9d. to 1s. per bushel; Greens, 6d. to 1s. per dozen bunches; Turnips, 1s. 6d. to 2s. 6d. per dozen bunches; Parsnips, 2d. to 3d. do.; Horse-

radish, 1s. to 1s. 4d. per bundle; Celery, 4s. to 8s. per dozen bundles; Carrots, 17s. 6d. to 20s. per ton; Cauliflowers 3s. 6d. to 5s. per tally; Endive, 1s. 6d. to 2s. per dozen; Mustard and Cress, 1s. to 2s. per dozen baskets; Cabbage Lettuce, 1s. 6d. to 2s. per dozen; English Onions, 8s. to 8s. 6d. per cwt.; Bordeaux do., 6s. 6d. to 7s. 6d. per case; Spanish do., 7s. 6d. to 8s. 6d.; do.; Belgian do., 6s. 6d. to 7s. per bag of 110 lb.; Dutch do., 6s. 6d. to 7s. do.; Parsnips, 4d. to 8d. per score; Beetroot, 4d. to 6d. per dozen.

STRAFORD: Feb. 4.—Supply has been good during the past week, and a fair trade was done at the following prices:—Cabbages, 1s. 6d. to 3s. per tally; Savoys, 3s. 6d. to 5s. 6d. do.; Turnips, 25s. to 35s. per ton; Carrots (household), 30s. to 40s. do.; do. (cattle feeding), 20s. to 25s. do.; mangolds, 14s. to 18s. do.; Swedes, 14s. to 19s. do.; Onions, English, 10s. to 11s. per cwt.; do., Spanish, 7s. 6d. to 8s. per case; Apples, English, 3s. to 4s. per bushel; Watercress, 6d. per dozen; Sprouts, 1s. 3d. to 2s. 6d. per flat; Celery, 6s. to 10s. per dozen roll.

POTATOS.

BOROUGH AND SPITALFIELDS: Feb. 4.—Quotations:—Regents, 4s. to 8s.; Hebrons, 40s. to 50s.; Magnum Bonum, black land, 40s. to 45s.; Bedford, 40s. to 55s.; Lincoln, 45s. to 70s.; Yorks, 55s. to 70s.; Scotch, 50s. to 55s.; Imperators, 40s. to 75s. per ton.

SPITALFIELDS: Feb. 5.—Quotations:—Magnum Bonum, 40s. to 65s.; Regents, 45s. to 70s.; Champions, 45s. to 55s.; Imperators, 45s. to 70s.; Hebrons, 45s. to 60s. per ton.

STRAFORD: Feb. 4.—Quotations:—Scotch Regents, 60s. to 70s.; Magnum Bonum, 60s. to 85s.; light English do., 50s. to 65s.; dark, do., 40s. to 47s. 6d. per ton.

HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, 78s. to 98s.; do., inferior, 40s. to 50s. Best hay, 60s. to 90s.; do., inferior, 26s. to 75s. Straw, 28s. to 40s. per load.

NOTICES TO CORRESPONDENTS.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

AZALEAS: W. P. It is not usual to cut down Indian Azaleas after flowering; this operation being performed with more advantage before the plant has bloomed—the plant is not exhausted by its efforts to bloom, and the season of growth is longer. Early winter pruning, or in the case of old plants whose wood does not readily break into growth, hard cutting back may be practised in October, and the plants kept cool and in a state of medium moisture, in fact, the plants are best when sunk in a bed of damp coal ashes, sand, &c. As soon as protuberances appear on the stem and branches, place in gentle warmth. Thinning of the shoots will have to be done, after it can be seen which are the best, and best placed. Azaleas may have straggling shoots cut back after flowering, that is if you wish to make the plant stiff and ungraceful.

BLACK BLOTCHES ON SYCAMORE LEAVES: D. The black patches seen nearly always on Sycamore (Acer pseudo-platanus) is a species of Rhytisma, a true parasite, whose mycelium penetrates the leaf tissues, and the cells of the leaf perish, thus forming the black patches; or they exist simply to support it. When the leaf falls, the fungus generates its spores. It is still an open question if the Acers, &c., suffer much from the attacks of the parasite.

CARNATION DISEASE: Loxwood. Your plants are attacked by the destructive brown mould, Helminthosporium echnulatum, figured in our issue for August 21, 1886. Pick off and burn every affected leaf.

CONCRETE WALKS: Concrete. Better leave the damaged concrete walks as they are until the

winter is past, and then you may coat them with a thin "slip" of Portland cement, made with about two-thirds cement to one-third fine clean sand. A little fine sifted gravel might be strewn over the surface and pressed into it.

DOUBLE NASTURTIUMS: *D. R.* These plants do not seed, and must be raised from cuttings. They are very pretty useful plants for decoration, growing rapidly during the summer. For summer use strike in autumn; keep the plants growing slightly in winter, and push them on as spring approaches. For winter use strike cuttings in late spring, and grow in a cold pit, and later out of doors, do not stink them at the root; by winter the strong growers should be in 12-in. pots.

GRAVEL PATHS FOR CONSERVATORY: *D. B.*—These are pleasant-looking, and may be kept in very good order by damping and rolling them when the surface gets loose. Usually the floor of the house where gravel paths are employed is also of gravel or Derbyshire spar, and which answer well, provided the floor has been efficiently drained—an easy matter generally. For this kind of conservatory some large plants are required to give it a furnished appearance. Small plants may be put at the front of groups and beds of tall and medium-sized plants, grouping them at salient points, and with the aid of a few large pots on which to elevate the middle and back-row plants, and moss to put around and over the pots, pretty effects may be obtained. Small wire baskets, vases, and tables for holding the choicer subjects, add variety to a conservatory so laid out, and look infinitely better than staging. The arrangements may be varied in the spring, when the hardier plants go out of doors, and the more robust palms, if there are any, will do well enough in the cool conservatory; and again in September, when plants are brought indoors. It is merely a question of putting the gravel of the walks in other directions. In doing this avoid the two extremes of needless crookedness or severity in the outline. If the house has shady or badly lighted parts, where choice plants would become shabby, hardy and half-hardy evergreens in pots or tubs answer well, and keep all their foliage throughout the winter. We mention Thuia, Laurels—especially the Portugal, Camellias, Pittosporum, Tobira, P. undulatum, Englemans in variety, Myrtles, Aucubas male and female, Pontic Rhododendrons, Aporosa lurida, New Zealand Flax, Astelia Banksia—an elegant, robust grass, good for a vase or centre plant. Ivy, and, less so, Euonymus Japonica.

HYACINTH FLOWERS PINCHED OFF: *Nemo.* See p. 90, in our issue for January 18 last. The case is identical.

INSECTS: *G. H.*—Your Scotch Fir shoots are pierced by the Pine Beetle *Hylurgus pini-perda* (fig. 30).

FIG. 30.—PINE BEETLE.

Pinching off the infested shoots and burning them is the best remedy. It is stated that decaying wood or bark is the favourite breeding place of this insect, so that material should be collected and burnt.

NAMES OF PLANTS: *Helleborus*. 1, *Helleborus colchicus*; 2, *H. lividus* probably—why send only a bloom?—*J. W.* 4, *Cotonaster Simonsii*; 5, *Viburnum Tinus*.—*T. R.* 1, *Woodwardia radicans*; 2, *Nephrrolepis exaltata*; 3, *Lastrea variegata*; 4, *Todea africana*; 5, *Aspidium coriaceum*; 6, *Cibotium Barometz*; 7, *Polypodium glaucum*; 8, *Adiantum Sancta Catherine*; 9, *Litobrochia incisa*; 10, *Maranta ornata*; 11,

Maranta argentea striata.—*T. B.* *Criuum amabile*. 1, *A. Dendrobium Linavianum*, *D. moniliforme* of gardens.—*T. Williams*, *Odontoglossum Humeanum*, a supposed natural hybrid between *O. cordatum* and *O. Rossi*.—*E. W.* *Corvus mas*.—*J. M.* *Thermopsis nepalensis*.—*H. J. C.* 1, *Lamarcia aurea*; 2, *Allium stamineum*; 3, *Lavandula Stoechas*; 4, *Rhagdiolus stellatus*; 5, *Linum pubescens* var. ?; 6, *Atriplex rosea*.—*G. W. C.* *Tillandsia (Anoplophorum) stricta*.—*W. Martin*. Seems to be a species of *Macaranga*, but we cannot say which one, without flowers or some knowledge of the native country, as two or three kinds have similar leaves.

PHYSANTHUS ALBENS: *E. T.* It seldom fruits under cultivation.

SLUGS: *W. Martin*. The objects sent are a curious species of slug (*Testaceus scutellum*), provided with a very small shell, which forms a shield or protection to the heart. Like other slugs it feeds on vegetables. *W.*

SOAP NUT: *G. H. Pugh*. The plant is *Sapindus saponaria*; it requires good sandy loam and leaf mould. It is a tree with pinnate leaves and panicles of small flowers.

STRAWBERRIES: *W. P.* It will almost be a waste of fuel and labour to force the plants if they fruited last year. Had they been shifted into large pots in August, and the formation of crowns encouraged, there would be some chance of a crop—there is none now.

VARIORUM.

PODOCARPUS SPICATA.—*Mr. Buchanan* gives an account of a Matai which was found prostrate in the bush, and over which three broadleaf trees (*Girardinia littoralis*) had grown, enfolding it in their roots; on felling these trees it was found that they were upwards of three hundred years old, but the Matai was perfectly sound, and was split up for fencing-posts.* *Mr. Blair* states that a Matai which had been prostrate in Waikiki forest from "time immemorial," had a Fuchsia with a trunk 9 inches in diameter growing across it. Used for weatherboarding, and similar purposes, it is found in good sound condition after twenty-eight years, with every appearance of enduring for an indefinite period. House-blocks, fencing-posts, and piles, are found in excellent condition after being down from fifteen to twenty years, or longer. I found sleepers on the Taupiri tramway with the heart perfectly sound after having been in use nine years, which is the more remarkable on account of their having evidently been taken from young trees. I believe that, so far as data are available, this exceeds the average life of a Totara sleeper. *T. Kirk*, in "Forest Flora of New Zealand."

TRADE NOTICE.

We are informed that Messrs. Richard Sankey & Son, potters, of Bulwell, Nottinghamshire, have taken 50 acres of clay-land in the vicinity of Bulwell, and intend to greatly develop their existing business.

TRADE MARK

FOR PLANTS.

QUICK. LASTING. ECONOMICAL.

This is a Plant Food of great excellence, carefully prepared with the view of supplying a manure which shall contain all the elements necessary for the perfection of Plant life, and at the same time be QUICK IN ACTION, LASTING, AND ECONOMICAL.

The ingredients have been so arranged that, whilst, notwithstanding luxuriant growth, permanent benefit is secured by a continuance of nourishment to the plant.

It is safe in use, and suitable for every part of a manure (required).

Sold by all Grocers, Nurseries, and Horticultural Establishments.

7 lb. 11 lb. 25 lb. 55 lb. 112 lb.
2s. 6d. 4s. 6d. 7s. 6d. 12s. 6d. 20s.

The above Trade Mark is printed on every Packet and Bag, and also impressed on the 15 of Seal attached to the mouth of each Bag.

A SAMPLE PACKET will be sent post free, on receipt of 1s. by the MANUFACTURER.

NATIVE GUANO: BEST and CHEAPEST MANURE for Garden use. NATIVE GUANO, Price £110 per ton, in bags. Lots under 20 cwt., 1s. per cwt. 1 cwt. sample bag sent, carriage paid, to any station in England on receipt of P.O. for 5s.

Extracts from *The Horticulturist's Annual Collection of Reports*—NATIVE GUANO for POTATOS, VEGETABLES, FRUIT, &c. C. F. HEDDER, Bostonia, used it for Potatoes, and says—"I found some of the finest crops of potatoes in 1889."

C. F. WALL, Gr. in Cal. the Hon. W. F. Talbot, says—"I am strongly recommending your Native Guano as a first-rate Manure for my fruit and kitchen crops, &c. &c. In 1889, during a hot & dry season, I had an excellent crop of 500 peaches."

NATIVE GUANO for ROSES, TOMATOS, &c. W. G. BATH, Nurseries, Devon, used it for Roses, Tomatoes, and Cucumbers, and says—"I find it a good and cheap article."

A. F. BARNES, Royal Horticultural Society, says—"Without doubt a very valuable Manure, not easy of application." Orders to the NATIVE GUANO CO., Limited, 20, New Ridge Street, Blackfriars, London, E.C., where Pamphlets of Testimonials, &c., may be obtained. Agents wanted.

BENTLEY'S INSECTICIDE.

Mr. G. WYLLIE, *Nylon House*, writes—"Bentley's Insecticide is a great saving in comparison to others. We use it largely, and it never fails to thoroughly eradicate all insect pests."

For particulars apply to JOSEPH BENTLEY, Chemical Works, Barrow-in-Humber, HULL.

TOBACCO PAPER, best quality, 8s. per lb.; 14 lb. 9s.; do. FIBRE, much stronger and better, 5d. per lb.; 14 lb. 6d.; do. cord, 5d. per lb., 2s. 10s.; 2s. 10s. carriage paid to any station. Large reduction to the trade.

PERK & CO., St. Andrew's, Bristol.

GREAT REDUCTION IN PRICE OF STANDEN'S MANURE

Established Nearly 30 Years.

The reduction has been effected through the introduction of increased and improved plant for manufacturing. It is now generally acknowledged that this highly concentrated Manure exceeds all others in general fertilising properties and staying powers, thus rendering its money value at least double that of any other Manure.

It promotes a rapid, healthy, and robust growth to plants generally.

It is a clean and dry powder, with very little smell.

It is consequently particularly adaptable for Amateurs equally with Nursermen.

Sold in Tins of increased sizes, 6d., 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in Kegs (Free) at the following greatly reduced prices: 28 lb., 10s. 6d.; 56 lb., 18s.; 112 lb., 32s. each.

SOLE MANUFACTURERS **CORRY, SOPER, FOWLER & CO. (LIMITED), LONDON.**

Sold by all Nursermen, Seedsmen, and Florists.

CHOICE ORCHID PEAT.

Prepared ready for use, free from all waste, 12s. per cask. Selected in Turves, 10s. per cask.

Price, 10s. 6d. each.
TESTIMONIALS.
The Gardens, The Whittens, Kingston, Feb. 9, 1888.
Dear Sir,—The 100 Barbed Wire Tree Protectors you sent to Mr. Green's order I have now fixed to the trees, and I feel bound to say that I never saw anything in the shape of a tree-protector equal to them. I think I shall be able to add further testimony after the cattle are turned out in the spring.
Yours faithfully, J. WEARING.
The Gardens, The Whittens, Kingston, Sept. 26, 1888.
Gentlemen,—The 100 Porcupine Tree Guards you supplied to Mr. Green's order have proved a great success—in fact, they are the best I ever saw. These guards stand well against the trees, therefore cattle cannot, and will not, attempt to reach the branches. I would strongly recommend anyone who contemplates planting trees, and wishes to know which is the best guard to use, to give preference to "C" a trial.
Yours faithfully, J. WEARING.

Messrs. Hill & Smith.

VULCAN IRONWORKS, WINCHESTER.

THE VULCAN HIGH DUTY HYDRAULIC RAM

Is the most efficient, self-acting Pump. It will force water from streams or springs on low levels to tanks or reservoirs on hills, &c. It saves all water carriage, and is always at work, requiring no attention.

say that it is necessary is a small fall from a spring or stream, say 24 inches, when water can be forced to heights varying from 200 to 300 feet, and 2 miles distant.

Estimates sent free for Driving and Fitting up Deep Wells and Pumps, Tub-Well Pumps, Fixed and Portable Garden Pumps, &c., and for Laying Domestic Water Supply to Mansions, Farms, Nurseries, Greenhouses, &c.
Address: H. P. VACHER, VULCAN IRONWORKS, WINCHESTER.

Shopman. WANTED, a young MAN, about 20, used to Retail Seed, Plant, and Bulb Trade, for W. suburb. One use to good-class trade.—Apply to A. B. R. S., Gardeners' Chronicle Office, 11, Wellington Street, Strand, W.C.

GARDENING APPOINTMENTS.

Mr. PETER COCKBURN, for the last twelve years Head Gardener to D. Y. STEWART, Esq., Barassie, Ayrshire, has succeeded the late JAMES BELL as Head Gardener to Lord BLANTYRE, Erskine House, Glasgow.

Mr. T. VANG has succeeded Mr. W. KING as Gardener to J. THEOBALD, Esq., M.P., The Bedford, Havering-at-Bow, Essex.

Mr. T. TROLOPE, late Gardener to Colonel H. STRATTON BATES, Twyford Lodge, Winchester, has been appointed as Gardener to Mrs. CONWAY SHIPLEY, Twyford Moors, Winchester.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be paid in payable at No. 42, DRYDEN LANE, to W. RICHMOND, Esq., unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it. N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Report Advertisements are received without name, address, or anything beyond the number on envelope, in which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Address, and also a Reference to the Advertisements which they wish reprinted.

Gardeners, Foresters, and Land Stewards.

R. B. LAIRD AND SONS can recommend with every confidence Scotchmen thoroughly qualified as GARDENERS, FORESTERS, or LAND STEWARDS, either for large or small establishments, and will be pleased to furnish full particulars on application.—11, FINEFORTH STREET, Edinburgh.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER and CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 287 and 289, High Holborn, W.C.

Gardeners, Foresters, and Farm Bailiffs. LITTLE and BALLANTYNE, The Queens's with Landlord Proprietors, Agents, and others requiring the services of GARDENERS, FORESTERS, and FARM BAILIFFS. Their extensive business relations throughout the Kingdom enable them to distinguish men of good character and ability, such as they would be glad to recommend.

SCOTCH GARDENERS.—I have at present several very superior MEN on my Register, whose character and ability will bear the strictest investigation.—JOHN DOWNE, Seedman, 144, Princes Street, Edinburgh.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

HEAD GARDENERS.—At the present time I can recommend several highly respectable MEN of known ability and first-class character.—THOS. BUTCHER, Seed Merchant, Croydon.

To Nurserymen and Others.

MARKET GARDEN.—Age 22; good reference from last and present situation.—A. RYMONDS, 4, Paradise Passage, Well Street, Hackney.

HOLLOWAY'S PILLS.—The Great Need.—The blood is the life, and on its purity our health as well as our existence depends. These Pills thoroughly cleanse the vital fluid from all contaminations, and by that means strengthen and invigorate the whole system, healthily stimulate sluggish organs, repress over-action, and in the order of circulation and secretion throughout every part of the body. The balsamic nature of Holloway's Pills exerts marvellous power in giving tone to debilitated and nervous constitutions. These Pills dissolve all obstructions, both in the bowels and elsewhere, and are, on that account, much sought after for promoting regularity of action in young females and delicate persons who are naturally weak, or have from some cause become so.

REMARKABLE SUCCESS IN THE PRODUCTION OF FRUIT.

GRAPES.

From Mr. PERKINS, the Right Hon. W. H. Smith, M.P., Henley-on-Thames, August 23, 1888:—"I have used several Vine Manures, but not any have ever equalled **Le Fruittier**, through which I attribute my success last year in obtaining FIVE FIRST-CLASS PRIZES."

From Mr. CHAS. MARTIN, Lord Dacre, The Hoo, Welwyn, Herts, January 18, 1890:—"Your **Le Fruittier** had a marked effect upon my Grapes this season, especially on Madresfield Court and Gros Colmar. His lordship said he never had Grapes so fine as this year. . . . There was a very marked improvement in the quality of Gros Colmar—much finer flavour with thinner skins."

Mr. ALLIS, of Old Warden Park, who has taken 1st prizes for Grapes, &c., at Sandy show, for eight years consecutively, says (letter dated September 14, 1888):—"I have this season used your **Le Fruittier** for Grapes, and have found them better coloured where it has been used, and carrying a good bloom. Lady Downes are better finished than I have had them for some years."

From Mr. G. M. BREESE, Lord Leconfield, Petworth Park Gardens, September 28, 1888:—"I have given your **Le Fruittier** a fair trial this season, and have no hesitation in stating that it has been very beneficial to all plants and fruit trees that I have applied it to. Cucumbers and Tomatos have greatly improved in a short time after its application. I THINK IT AN EXCELLENT MANURE FOR VINE BORDERS, especially when mixed with the soil as a top-dressing. I saw a marked improvement in some old Vines, both in size of bunch and berry. Chrysanthemums like it, and all other plants that require high feeding."

From Mr. G. CLAYDON, Woodbury Hall, Sandy, September 6, 1888:—"I have used **Le Fruittier** for Vines, Peach trees, and Strawberry plants, and we had the Grapes had much larger berries than we have had them for years, and we find it a great help to finish Peaches."

From Mr. G. H. RICHARDS, Lord Normanton, Somerley, Ringwood, Hants, July 25, 1888:—"More than a two years' trial of your **Le Fruittier** has convinced me that it is a preparation which would be difficult to improve upon as an all-round Manure for Vines, either in pots or planted out. Some Manures recommended for Vines produce luxuriant foliage and strong wood, without however touching the fruit itself in a corresponding degree. **Le Fruittier** seems to benefit the fruit quickly."

From Messrs. INGRAM & WHITFIELD, Aylesbury, Bucks, July 16, 1888:—"We have much pleasure in sending you a small part of the fruit grown by you **Le Fruittier**. We thought it would be more satisfaction for you to see the fruit which gained the prize, which we consider highly satisfactory, and we trust it will be the means of increasing the sale of some further order to follow."

From Mr. C. GOLDSMITH, C. A. Hoare, Esq., High Trees, Redhill, January 10, 1890:—"Le Fruittier is one of the very best Manures I ever used, especially for Peaches and Nectarines."

From Mr. G. H. RICHARDS, Lord Normanton, Somerley, Ringwood, Hants, October 17, 1887:—"I may say that the trees to which the Manures have been applied have carried double the number of fruit; the fruit all finished satisfactory in all that we could desire in point of size, colour, and flavour."

From Mr. COX, The Warrens, Bushey Heath:—"My Peaches this year averaged half a pound each, and I have had the heaviest crops this year I ever had, for which I thank **Le Fruittier**."

From Mr. GAIGER, The Gardens, Blakewell, January 11, 1888:—"I find **Le Fruittier** a most excellent Manure for fruit trees. I have used it with good results for Peaches, Nectarines, &c."

From Mr. THOS. NUTTING, J. B. Maple, Esq., M.P., Childwickbury, St. Albans, September 18, 1888:—"As I have grown my pot Peaches, exhibited at Harpenden show, with your **Le Fruittier**, it may interest you to know that the dish of six fruits weighed 3 lb. 2 oz.; the tree carried about two dozen fruits."

From Mr. G. H. RICHARDS, Lord Normanton, Somerley, Hants:—"I send you a photo of four Pear trees in pots, grown and fed with your **Le Fruittier**. Size of pots—two 11, and two 11-inch diameter; number of fruit, 165; average weight of fruit, $\frac{1}{2}$ lb. each. This speaks for itself."

From Mr. T. B. LEADBETTER, A. Wilson, Esq., Tranby Croft, Hull, July 27, 1888:—"After giving your **Le Fruittier** a fair good trial upon pot Strawberries, I am well satisfied with results; the fact being that I never had forced Strawberries so fine, both in flavour, size, and colour, as they were this season, fed entirely with **Le Fruittier**. My employer often spoke of their size and quality, and said he never had forced Strawberries so good."

From Mr. T. WOOLFORD, A. Palmer, Esq., East Thorpe, Reading, February 7, 1888:—"Your **Le Fruittier** appears to be particularly suitable for pot Strawberries. Plants on which I tried it finished nearly double the crop, and of better quality than others did of the same sort, grown side by side and watered with manure water composed of horse and cow droppings and soot."

Mr. Lippincott's Agent, of Aylesbury, July 20, 1888, writes as follows:—"Our Strawberries and Vines were dressed with your **Le Fruittier**, and we took 1st prizes in the amateur class at the late show."

From J. OSBORN, J. N. Mappin, Esq., Southgate House:—"Le Fruittier has proved to be very successful in my Melon-house."

From Mr. W. J. EMPSON, The Gardens, Amptthill House, Amptthill, January 25, 1890:—"I have your rightly named your **Le Fruittier** 'The Perfection of Plant Food.' It is the best Manure I have ever used. I cut Melons, last year, fed with your **Le Fruittier**, weighing from 6 lb. to 8 lb. each."

From H. PERKINS, the Right Hon. W. H. Smith, M.P., May 9, 1889:—"I should like you to see some pot Vines which I have fed with **Le Fruittier**, everyone that has seen them say they have never seen better. I believe it to be the best Manure for Vines in the market."

Amongst other Rare Varieties the following may be named:— 'Two-ways Trianae', Dendrobium densiflorum, Dendrobium purpureum, Dendrobium superbum, Dendrobium thurstonianum, Dendrobium fabrianum oculatum, Lælia purpurata, Aerides Fiedlingii, Aerides Sandieriana, Aerides longicaulis, Doyanum, and others. Cypripedium Massangense, and other varieties; Cypripedium Druryi, Cypripedium Calceolatum, Odoatogetonum vexillarium, roseum, and superbum; Sobralia xantholeuca, Dendrobium speciosum, and many other rare sorts.

MESSRS. LYON and TURNBULL will SELL by AUCTION, within their Rooms, No. 51, George Street, Edinburgh, on WEDNESDAY NEXT, February 19, at 12 o'clock, the above important COLLECTION of ORCHIDS and other PLANTS, to which they respectfully direct the attention of Growers and Exhibitors. Particulars in Catalogues, which will be sent to applicants.

Mount View, Sheffield.

SALE OF THE SECOND PORTION OF THE VALUABLE COLLECTION OF ESTABLISHED ORCHIDS, formed by the late David Ward, Esq., J.P. The Collection is in the best possible condition, is one of the finest in the district, and many of the specimens are of the best and rarest. This Sale will include a fine lot of Dendrobium Wardeianum and Dendrobium nobiliss, magnificent specimen Cyclodium Downianum, with sixteen fine Hopkisses; four large Cyclopogon, orcids, also TWOVE and GREENHOUSE PLANTS, Rhododendrons in pots, including five specimens of Lady Alice Fitzwilliam; six fine Lapageria alba, Camellias, Fruit Trees in pots, &c.

MESSRS. WILLIAM BUSH and SON are instructed by the Executors to SELL by AUCTION, at the residence, as above, on WEDNESDAY and THURSDAY, March 5 and 6, at 11 o'clock each day, the Second Portion of the above VALUABLE COLLECTION, comprising upwards of 500 lots in Bloom and Bud.

Catalogues and orders to view may be had of the Auctioneers, at their Offices, 2 and 3, East Parade, Sheffield.

Wednesday Next.

CHOICE-NAMED Standard, Half-standard, and Dwarf ROSES, including many of the best known varieties; CARNACTIONS and BORDER PLANTS, Pyramid and Dwarf-trained FRUIT TREES, RHODODENDRONS, in Flower and Bud; Hardy Ornamental SHRUBS and CONIFERS; LILIUM AURATUM, Home-grown LILIES, &c.

M. J. C. STEVENS will SELL the above by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, February 19, at half-past 12 o'clock precisely. On view morning of Sale, and Catalogues had.

Thursday Next, February 20.

VALUABLE IMPORTED and ESTABLISHED ORCHIDS. M. J. C. STEVENS will include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, February 20, the following ESTABLISHED ORCHIDS:—The new GRAMMATOPHYLLUM MEASURIANUM, one of the most beautiful of modern introductions; DENDROBIUM MACFARLANE, new, and very fine. LÆLIA EYERMANIANA, new nat. hybrid, majalis v. autumnalis. OPHANTALOSMUM EDWARDSI, fine specimen, with fine spike, covered well with bloom. CATTLEYA SCHOEFIELDIANA (true), in flower, grand var. LÆLIA CINNABARINA, a noble specimen, with five flower- buds.

- DENDROBIUM CILIATUM, rare Dendrobe.
ONCIDIUM TETRAPETALUM, rare and pretty.
ONCIDIUM CIRCUTATUM, in flower, extremely rare.
RAPHIDOCALYPSA DORNI, magnificent, and extremely rare.
PHAIUS TUBERCULATUS, splendid plant, with flower-spike.
CATTLEYA MAXIMA PERUVIENSIS, fine specimen plant, the grand dark variety.
CYPRIPEDIUM FISHII, fine plant in bud.
... BOTRICHILDIANUM, fine plant in bud.
... AMESANTHUM, fine plant in bud.
... CANTHUSIUM, fine plant in bud.
... LEEANATHUM SUPERBUM, fine plant.
... TONSUM, fine plant.

And many other valuable and popular varieties. On view morning of Sale, and Catalogues had.

Thursday Next.—February 20.

VALUABLE IMPORTED and ESTABLISHED ORCHIDS. M. J. C. STEVENS will SELL by AUCTION at his Great Rooms, 38 King Street, Covent Garden, W.C., on THURSDAY NEXT, February 20, at half-past 9 o'clock precisely, by order of Messrs. Sander & Co., CATTLEYA GASKELLIANA, a fine lot of Plants, and in first-class condition. This lot is in the best batch that our horticulturists have ever seen. The known habitats of this variety, and we are sanguine that many interesting surprises are in store for purchasers from this lot of plants. CATTLEYA GASKELLIANA, a new variety, these plants were collected quite out of the track of previous consignments, they doubtless belong to the same section that has recently furnished us with such eminently grand forms as Harlyman, WAREHAM, &c. Also a fine lot of strictly well-shaped plants of VANDA CEREULEA, the blue winter-flowering Vanda. DENDROBIUM NOBILIS, in fine condition, many large masses, and probably many very fine forms. The purple Dendrobium Fargesii and golden Chromolaena, Lælia borophylla, orange-scarlet, ACRIDES SANDIERIANA, the finest Aerides; LÆLIA GRANDIS, old gold and deep rose; CYPRIPEDIUM SANDIERIANUM, longest-tailed Cypripedium; CATTLEYA WAREHAM, imported, and many other CHOICE and VALUABLE ORCHIDS.

On view morning of Sale, and Catalogues had.

Thursday Next.

SEVERAL THOUSAND GRAND BULBS of LILIUM AURATUM and many other LILIES, from Japan; 10,000 extra fine EARLY TUBEROSES from America, &c. M. J. C. STEVENS will include the above in his SALE by AUCTION at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT February 20.

On view morning of Sale, and Catalogues had.

HENRY CANNELL & SONS'

Our **KENTISH VEGETABLE SEEDS** germinated nearly 50 per cent. beyond those from Northern Counties, non-growers, and co-operative stores.
 Our **CATALOGUES** are certainly the most important of all books for the Garden.

A. WILMORE, Esq., King's Lynn.
 Sirs,—Parcel of Seeds to hand, and, if anything, nicer than ever. I have read your Catalogue through and through. What a lot of valuable practical common-sense they convey to Gardeners and Amateurs. THEY ARE WORTH MORE THAN A GUINEA A BOOK.

MR. J. COOKSON, The Gardens, Beech-hurst, Eccles.
 Sirs,—Thank you very much for Catalogues—no Gardener should be without them.

An immense advantage gained in having your Seeds direct from the actual producers, from one of the most sunny spots, and off our soil yield considerably more and at nearly wholesale prices.

H. CANNELL & SONS, SWANLEY, KENT.

GOLD MEDAL.

Quite the most original **CATALOGUE** in the Trade. Terms and Prices certainly the best. Post-free to every applicant.
Every Gardener should see this List, because a number of exceedingly good things can only be had from us. We very urgently indeed press gardeners to write for this List.

The New Japanese Primulas, the most startlingly remarkable flowers ever raised in this group. Desired to be as generally known as *Primula sinensis*. Most highly praised by every horticultural paper, and by the Times and London Press. Three Medals in three weeks. These are of such very special character, and will be so much talked of this spring, that every lover of choice flowers should see on full account of them in Catalogue.

Gold Medal for Tuberous Begonias.—The cheapest in the Trade. Every lover of good Begonias should see our List. We have been delightfully successful, and our strain is grand beyond all description.

Seeds that Give Satisfaction.—Our great strength as a seed firm, and the cause of the extraordinary growth of our business, is the splendid quality of our strains of flowers, and the front rank reputation we have for Exhibition Vegetables.

500 in Prizes and Two Medals are offered by us to our customers only, on so ingenious a plan that all can compete on fair and equal terms, wherever they may reside. All who can grow things well should see our Catalogue.

The best proof of our confidence that our terms and prices are of the best is that we send our Grand, Illustrated, Descriptive, Full Cultural note **CATALOGUE**, Post-free to every applicant.

HARTLAND'S GOLDEN QUILLED SUNFLOWER, "SOLEIL D'OR"

WILLIAM BAYLOR HARTLAND submits the following relative to the merits of this plant. He has no other means than with such testimony of adding force to what has already been written on the subject. There is no doubt the Irish variety is quite distinct from that known in England, and he is sincerely obliged to Messrs. Pearson, Backhouse, Payne, and Cullingford for what they have written him on the subject.

"* Strong Plants (Orders now in strict rotation), 12s. per dozen: (s. 3d. each.

Dozen lots post-free.
Single plants 3d. extra for postage.
Trade Terms on application.

"Your Soleil d'Or Sunflower is certainly perfectly distinct from the ordinary form grown in this country, and is, we think, rather richer in colour. It will be a decided acquisition to our English gardens.

"A. AND C. PEARSON,
"Chilwell Nurseries, Notts."

"We like your Soleil d'Or Sunflower very much. It is now in flower, much in advance of the ordinary form.

"JAMES BACKHOUSE AND SONS,
"Nurseries, York."

"Your box of Soleil d'Or Sunflower blooms to hand. I am much obliged for your sending them. Several of the blooms are much finer than the drawing or illustration you publish, and they form a really attractive and agreeable vaseful.

"C. HERMAN PAYNE,
"Thorn Road, South Lambeth, London, S.W."

"Dear Mr. Hartland,—I am writing to tell you how very pleased I am with your quilled herbaceous Sunflower. I have grown nearly all the varieties of Sunflowers for many years, but of all the double flowers I consider this the very best.—Yours truly,

"W. H. CULLINGFORD,
"Earl's Court, Tambridge Wells, London."

"* The plant has also been sent to Kew and Chiswick Gardens for trial, and PRONOUNCED QUITE DISTINCT.

"* Year Book of Seeds for 1890, now ready.

THE ADVANTAGE AND UTILITY
OF PLANTING WASTE LANDS.

THE planting of waste lands has formed the subject of much discussion and enquiry in all societies interested in rural economy, and the advantages accruing therefrom have been anxiously considered by all parties interested in the possession and management of landed property. From this fact alone, it is difficult to throw much new light on the subject.

To say that there are great benefits arising from the afforesting of our waste lands is only stating a truism, and the object of such a paper as I have been requested to give, is not so much to enforce what is so generally admitted, as to endeavour to show the advantages arising therefrom in a perspicuous form, and if possible arouse greater interest in, and demonstrate the necessity of rectifying, if possible, what is really a great national neglect.

Perhaps of the three kingdoms, Scotland has done more than any other to rectify this mistake, but that does not arise so much from a national predisposition to plant (although her ancient name of Caledonia would entitle her to some claim), but from the fact that of the three kingdoms, possibly she possesses more waste land than any other, and planting is the only means whereby many of her bare hills and comparatively barren plains could be profitably utilised. We in Scotland, however, have had many noble examples of proprietors who early seemed to realise the necessity of planting; notably amongst those we may mention the names of the Dukes of Athole and Argyll, as well as Lord Haddington and many others, who, in the latter end of the last and early in the present century did much to arouse the planting spirit in Scotland, and their successors have reaped a rich harvest from their large-minded foresight. In our own day, immense tracts have been planted by the Duke of Richmond and Lords Seafield, Lovat, and Breadalbane, besides many others

* A paper read by Mr. C. S. France, at the Aberdeen Horticultural Association, on January 8, 1890.

DANIELS BROS.,
TOWN CLOSE NURSERIES, NORWICH.

whom we might name, and whose properties are now luxuriant in wood, where before it was sterile waste.

These proprietors deserve well of their country, because while each may be said to have planted with the primary view of improving their own properties, they have at the same time been adding greatly to the national wealth. With all those noble endeavours, however, to clothe our hills with a crop of Nature's noblest products, there is still much to be done to fully clothe our waste lands. The question naturally arises, then, why is planting now at a comparative standstill? We answer that there have been many influences at work during the last twelve or fifteen years to hinder its progress; not the least important of which has been the depressed state of agriculture. There has also been very great political fearfulness and want of confidence in the existing state of things, thereby inducing proprietors who would otherwise plant, to desist from doing so. Many have not the means, on account of their largely reduced rentals; and even those who have the means, are not disposed to use them, because that spirit of change which is pervading all our institutions induces many to think that neither they nor their heirs may ever reap the benefit of the outlay. This, however, opens up a great national economic question, which it is obvious that this is not the time nor place to discuss.

Our object is, if possible, to show that under comparatively adverse circumstances, it would pay to plant, and that the doing so is not only advantageous, but useful to the possessor of land, as well as being a national necessity. The wise saying put into the mouth of the Laird of Dumlydikes by our great national novelist, "Aye be stickin' in a tree, it will be growin' when you're sleepin'," was no less true then than it is now, and it would be well if many of our large landowners would realise the full import of these words.

The first question that meets you when you propose planting is, will it pay? In this age of pure £ s. d. in all undertakings, this is naturally the first inquiry. Now let us see if it will pay.

Speaking from many years' experience, I have no hesitation in saying that it will. It may not give such an immediate return as a crop of grain or Turnips, nor will the planter reap the full benefit of the "paying," but as a capital investment, I say, and am prepared to show, that it will pay. Let us give an example or two, and in doing so, I do not state them as problematical possibilities, but the examples I will give are drawn from facts which have come under my own personal observation and experience during the last thirty years.

Before, however, going into this more fully, I wish to safeguard myself against a common error which many writing on this subject have fallen into, viz., the over-estimating of the profits of woodlands. It is quite easy with respect to the ultimate profits of plantations to show a state of things which will represent a clear gain under any circumstances. In fact, this is too much the practice of all speculative calculators, whether as planters of trees or any other crops.

We are not, however, desirous to go beyond absolute facts in endeavouring to show that planting trees is the most profitable crop to grow under all circumstances; nay more, we affirm that such is not the case, but we wish to show that there are thousands of acres of waste lands in the United Kingdom at present not worth more than from 1s. to 2s. per acre, and which if judi-

ciously planted, would gradually yield a handsome return to the proprietor, and eventually be a source of great national wealth. It is obvious that the certain lapse of time which must necessarily intervene between the planting of trees and their attaining a disposable size, must render any calculation made at the time of planting extremely problematical, therefore these calculations must be treated with very considerable caution; but while this is so, there is another and equally important factor, which can never be properly estimated, and which may represent quite as much, as the pure enumeration of certain results represented by £ s. d. in a given time, and that is the advantage and utility of planting in its relation to the enhancing of the value of neighbouring exposed lands, by the shelter it affords, and the ameliorating influence it produces on the climate, thereby making land for other crops fertile which before was comparatively unproductive. In planting waste plantation lands, therefore, plantations should be laid out with a joint view to all or any of the advantages attendant upon them, and money so invested should be looked upon as the investment of capital in the same way as any other investment of land or property; therefore, with respect to the actual value of trees in plantations as tangible capital, this can only be calculated in relation to the additional value conferred on adjoining lands by the improvement of the climate, as well as adding beauty to the landscape, which in itself is no mean consideration in the value of property. In high and bleak situations, the proper distribution of plantations, either in screens or irregular masses, have increased the value of adjoining lands by, in many cases, one-third. When, therefore, we take into consideration the intrinsic value of the products of these plantations in addition to this, I think we make out a very fair case in favour of planting as an investment.

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

COLCHICUM PROCURENS,* *Baker, n. sp.*

I HAVE NOW, THROUGH THE KIND HELP OF MR. BARBY AND AUTRAN and Mr. Dewary, got to the bottom of the curious Colchicum with a creeping rhizome, from Asia Minor, on which Mr. Barr asked my opinion a few weeks ago. It appears that it inhabits the mountains in the neighbourhood of Smyrna—that it was discovered by Mr. Whittall, and that it has been distributed in England under the name of *Merendera sobilifera*. It closely resembles that plant in its rootstock, but *Merendera* has no perianth-tube, and *M. sobilifera* has very narrow perianth-segments and leaves contemporary with the flowers. Our plant has a long perianth-tube, an autumnal flower

* *Colchicum (Elastodes) procurens*, Baker, n. sp. — Rhizome "repens" cylindrical horizontal, vel obliquely extremate uncinato (tunic membranacea brannea); foliis tribus verisibus linearibus obtusis; flore solitario autumnali; spatula cylindrica tubo quam limbo duplo brevior; segmentis oblongato-oblongis sesquipedicibus haud tessellatis; antheris Inteis filamentis aequalibus; stylis staminibus aequalibus.

Rootstock a horizontal or oblique thick fleshy rhizome an inch or more long, with a thin brown membranous tunic, hooked at the end, from which the flower of the previous year has come, not bearing any tooth on the upper margin. Leaves three to a sheath, produced at the beginning of February, linear, 1-6th inch broad, dull glaucous green, channelled deeply all down the face. Flowers one to a spathe, produced in October. Spathe pale, scarious, cylindrical, 3 inches long, oblique at the throat. Perianth with a pale cylindrical tube protruded 2 inches from the spathe, altogether 4 inches long; segments oblong to oblong, about 10 inch long, plain bright lilac, with a distinct groove down the claw. Stamens 3 inch long, anthers lanceolate, yellow, sagittate at the base, about as long as the filaments. Styles reaching to the top of the anthers; stigmas small, terminal, capitate. *J. G. Baker.*

very like that of *Colchicum autumnale*, and leaves that do not appear till spring. I have never before seen a *Colchicum* with a creeping rhizome. A plant with that character from the mountains of Laconia, in Greece, is described by Boissier in the *Flora Orientalis*, vol. v., p. 146. It was discovered by Professor Orphanides, and named by him *Colchicum Boissieri*, and upon this Boissier's section, *Blastodes*, is founded. The plant from Smyrna, it was obvious, was closely allied to this, but we had no specimens of it for comparison. Now Mr. Barby and Autran have kindly lent me the type specimens, and I find that Mr. Whittall's plant is distinct specifically. *C. Boissieri* has only two leaves to a cluster, and they are longer and more acute, its spathe is herbaceous and green, its rhizome is more slender and cylindrical, with a curious tooth from its anterior edge, and it is not hooked at the end. We have received the Asia Minor plant at Kew under the name of *Merendera sobilifera*, and it is now producing its leaves in the herbaceous ground; and it is most likely it has been distributed in other collections under the same name. *J. G. Baker, Kew.*

EUCHARIS AMAZONICA.

A PLANT so generally popular—and deservedly so—as *Eucharis amazonica*, receives always great attention from the gardener, and any methods of culture which may have resulted in an abundance of large blossoms and healthy foliage are eagerly sought after.

The plant figured on p. 193 is, as will be seen, an example of first-class cultivation, and an object of beauty which any gardener might point to with pardonable pride. We will let our correspondent, Mr. W. Dean, of Solihull, Birmingham, who kindly sent the photograph in November last year, describe this plant and its culture in his own words:—

"One of the finest specimens of this plant we have yet seen has recently flowered at The Henburies, Moseley, Birmingham, the residence of G. F. Lyndon, Esq. *Eucharis* are well grown here, one plant especially deserving notice, because of its size, its perfect health, and colour and size of the foliage, and abundance of fine flowers. This plant is in an 18-inch pot, and about six years old, and has had four repottings in the last four years. It is 4½ feet high, 5 feet through, and had 36 flower stems, with quite 220 blooms on them, the flowers large, and the foliage in the best of health. Mr. John Black, the gardener, uses a soil composed of good loam, a little leaf soil, some broken sandstone, and a few half-inch bones, with plenty (quite six inches) of drainage to allow water to escape freely. He finds that the roots adhere to the sandstone, and evidently derive benefit therefrom. The plants are kept through the winter and spring in a temperature of from 60° to 65°, but when blooming they are removed to a cooler house, but if kept too long, then the foliage suffers and decays. Watering is an essential point with Mr. Black. He uses very little directly on the soil, and then only in hot weather, and manure-water, and resorts to frequent syringings into the foliage, always with clean manure-water, using this freely in the growing season, but he never allows the plants to dry off. Too much soil in the pots and too much water at the roots Mr. Black holds to be injurious, and he trusts more to the copious syringings of the plant with weak manure-water. Some diseased bulbs of *Eucharis* sent to the Henburies some time since were washed and placed in a pan of sand with sphagnum at the bottom, where they grow freely, and were soon restored to health.

THE APRICOT.

Why is it that the Apricot is not more largely grown? Is it on account of its uncertainty of fruiting, the dread of branches dying off so mysteriously and so frequently, just as the fruit is beginning to ripen? or is it because of the collapse of

the flower-buds just as their expansion is expected? It may be that all these reasons may account for its neglected cultivation. If my conjectures are the right ones, I have no hesitation in saying that such bogies as these, which are so easily laid, ought not to frighten gardeners who have far greater difficulties to surmount in their daily occupation. Let us take the dreaded evils mentioned *ad seriatim*. First, "the uncertainty of fruiting." This is common to all fruits, and to Apricots more

believe, to the immaturity of the young shoots, and the consequent imperfect development of the fruit buds, so that even if they do not drop prematurely, they are barren of pollen, and so fail to set. A partial, and only partial, remedy, is to select the most favourable aspect for the trees, and I find that one that is due west is far better than the due south side, on both of which we have had good crops of fruit, but the west has proved itself the better. There is one other item which in some degree may prove

despair, the attempt to ascertain the reason why it is that branches of Apricots die off so mysteriously, but I claim to have found a remedy, and that is the keeping a reserve stock of young trees to replace those that die off in this manner. By this means I have been able for years to keep every foot of the wall that is devoted to Apricots fully furnished with fruit-bearing trees.

Next, as to the "collapse-dropping of the flower buds just as they seem likely to unfold:" the

FIG. 31.—EUCHARIS AMAZONICA. (SEE P. 192.)

than other trees, so that I will not lay too much stress on this fault, because I believe the evil may to some extent be overcome. Apricots are usually far too precocious. As this year many of the flower-buds were half expanded on January 16, failure will almost certainly ensue if sharp frosts set in, if the trees remain unprotected. The application of efficient protection, therefore, meets one half of this difficulty of uncertain bearing; the other half is not quite so easily remedied, being due, as I

helpful in warding off this uncertainty of fruiting and that is the application of slight autumnal protection to trees that have made growth late in the season, and which, when early frosts set in, get crippled, and the wood remains immature. I do not pretend to have fathomed the why and wherefore that trees die piecemeal, but I have also not been able to accept as correct any of the many theories which have been propounded on the subject; in fact, I have given up in

most common cause of this, I believe, to be drought, dryness at roots in autumn, at which season it is just as necessary to have the roots in full activity as it is when the fruit is swelling off, and the same vigorous root action should be encouraged till the buds are hard and brown, there would then be little cause for alarm as to bud dropping. Immaturity of buds, by reason of ungenial autumn weather, is no doubt some-times the cause of a percentage of the buds dropping, but in

the majority of instances, autumn drought is the cause. The disposition that we all feel to "rest and be thankful" after the harvesting of a good crop of fruit, tends to the forgetfulness of the fact that the fruit of next year is being manufactured, and this, and the neglect of the trees after gathering the fruit, are sure to end in failure. On our light soil, we find it necessary to water the trees even more copiously after the fruit is gathered than previously, and rarely indeed have we to complain of an Apricot crop that is under average.

Having no practical experience of growing the Apricot under glass, I feel reluctant to say anything on the subject; yet from examples of culture in some neighbouring gardens, I have formed a very decided opinion as to the merits, or rather demerits, of the system. I said "demerits," and surely that is the right term to apply when never once have I seen through a long series of years trees under glass bearing what one would be justified in describing as one-third of a crop, and in many seasons not a fruit at all. I shall, therefore, have to change my views greatly before I am prepared to advise the growing of Apricots in orchard-houses, either planted out or in pots. The latter mode might possibly be successful, because, the trees being portable, they could have the desired rest and exposure to the atmosphere by plunging the pots in leaves. But at what a cost of labour a crop of fruit would be bought! Watering, top-dressing, housing and unhousing! No; I'll have nothing to do with growing Apricots either in pots or in houses. I will let well alone, and keep to growing the fruit on walls having a west aspect, and in soil not enriched by animal manure other than such as is applied to the surface in the form of mulchings; but in good sound loam, with a fair percentage of chalk, added to loams that have not this ingredient in a natural state, and pounded oyster-shells and half-inch bones, if obtainable, should be added at the rate of 1 cwt. to every three loads of loam. This kind of compost is the perfection of an Apricot soil, less the pounding to be done soon as the trees are planted; and the harder it is rammed at that time the better will the roots be, because having, as it were, to fight their way through the hard soil, side rootlets are formed, whilst the principal roots are boring their way to the outside limits of the border. Having tried nearly all known varieties of Apricots, I have reduced the number to four; they are Shipley's, Royal, Moor Park, and Peach, sometimes called Grosse Peche. *W. Wildsmith*, [This article has a sad association, as being the last written for us by its lamented author. Ed.]

PLAN OF A GARDEN AND SURROUNDINGS.

The garden (a plan of which, and the grounds surrounding it, see fig. 32) was laid out for a gentleman near Emsworth by Mr. Baines, of Palmer's Green, N. The place is situated at a short distance from Emsworth, on its northern side, and the London, Brighton, and South Coast Railway—from which the place may be seen—bounds it on the southern side. The sea, which comes close up to the opposite side of the town, is about a mile distant from the property, and although the influence of the sea air is felt, most of the best kinds of evergreens and deciduous trees and shrubs thrive and do well, many things succeeding which, further inland, suffer in severe winters. In the planting, only well proved species and varieties of Coniferae have been used, those that are doubtful, or that only succeed in exceptional localities, being excluded. The best kinds of evergreen shrubs, and all the best deciduous flowering shrubs and trees, including many fine things that are not now so often met with as their merits entitle them to be, have been introduced in quantity. The shelter belts on the outer portions of the grounds consist mostly of *Pinus Laricio* and *P. austriaca*, with small growing deciduous flowering trees at intervals in front.

As is often found in districts near the sea, there is not very much undulation in the surface for a considerable distance; but the land falls gently from the site of the house on the eastern side, and also to the west, in which direction, as well as to the north, there are extensive views.

Only the garden and its immediate surroundings are shown in the plan. In the general arrangement of the place, convenience in getting about it, as well as appearance, have been kept in view, and provision has had to be made for a small herd of cows and other farm stock. The letters indicate as under:—

- A. Orchard.
- B. Farm buildings.
- C. Yard.
- D. Stables.
- E. Coach-house.
- F. Range of plant and fruit houses.
- G. Herbaceous border.
- H. Kitchen garden.
- J. Herbaceous border.

A GARDENERS' PROBLEM.

I do not remember to have read anything so interesting as the correspondence upon this subject. It goes down to the very root of the matter, and enables one's perhaps somewhat hazy ideas of the relation between botany and cultivation to assume form and substance. A man who has never grasped the first principles of plant-life, though he may succeed to a certain extent by "rule-of-thumb," can never make a really good gardener or cultivator; and a good solid foundation of knowledge in this or any other calling, one may build up anything; without it only a shaly superstructure can exist, which may topple over at any moment. The foundation cannot be too strong; our knowledge of first principles cannot be too great; and there is nothing like discussion of this kind to strengthen the one and increase the other. I am not an "authority," but cannot refrain from saying a few words on the subject, if only as one who has given this and kindred matters some considerable amount of thought and study, from the point of view of a practical cultivator.

There can be little doubt that Mr. Dyer is perfectly right as regards the greater part of his remarks and premises, though I cannot agree with him in *detail*. In the problem referred to, we come face to face with a seeming anomaly, almost a paradox. Nature is usually so consistent, so just; her laws, like those of the Medes and Persians, are unalterable, and try as we may, we cannot cheat her in the smallest degree. This is doubtless one reason of the intense reverence accorded to her by those who know her best. We see, we admire, we revere, but we cannot always understand or follow her in all her marvellous operations. Now and then the student of Nature must expect to meet with such a problem as the one in question, and though no exact and positive answer to the question of "why?" or "how?" may be found, still inquiry, argument, can do no harm, but may and probably will do good.

The matter may be argued thus: Nature, the all-wise, having the entire management and distribution of the innumerable genera of vegetation in her own hands, would, it might be presumed, allot to each individual the position and conditions best suited to its greatest well being and highest development. But in practice we find that, to all appearance, this is not exactly the case, and that—again I say apparently—better results are obtained under greatly, if not totally, different conditions to those under which the plant exists in a state of nature; and again, more puzzling still, that when we attempt to imitate these natural, and, therefore, suppositiously best conditions, we frequently fail altogether. This can only be accounted for in one of two ways, either we are altogether wrong in our conclusions, or else there is some good and cogent reason for the apparent anomaly, which we cannot, or have not yet, fathomed.

For my own part, I incline to believe that it is almost entirely a question of conditions. Every plant that grows succeeds best under not one, but a certain set of conditions. Disturb one, and you must alter others; if we cannot imitate the whole, we must discover a totally or largely different set. Here it is that the empirical skill of the true gardener comes in. As Mr. Dyer justly remarks, a really expert cultivator knows instinctively what a plant, with the nature of which he may be unacquainted, requires. He must proceed tentatively, and may not succeed at first, but sooner or later he will do so. Like a skilful physician, he must be an expert at diagnosis, he must have the power of seeing through the plant, as it were, and though destitute of any definite guide to ascertain, as by instinct, what will suit it, and what not.

Constitution is an excellent word as applied to plant-life. Without doubt, every plant that grows possesses a constitution equally with a human being, and the similarity between the two may be worked out to a really marvellous point. The chief difference is that it does not, as a rule, vary in different individuals as it does in the human and other animals, or, at least, in nothing like the same degree; generally speaking, any set of conditions or treatment that will suit one individual of a given species and variety will suit all.

The facts upon which the discussion is based are indubitable; let me cite a few instances that have come under my own notice. Take for example, the common *Azalea indica*, of which so many thousands are annually imported from the Continent. In Holland they are grown in beds of soil composed chiefly of leaf-mould and sand; but if we plant them in similar material here they fail! With as nothing suits them like peat. Then look at the Persian Cyclamen, which in its native state flourishes in sandy loam on the rocky hillsides of Palestine, where for six months out of the twelve it is literally roasted. In this country we find it succeeds best in a partially shaded spot in summer, the pots being plunged in some moisture-holding material, and the soil never allowed to become dry! If dried off according to the old practice, the roots dwindle and die. Take the *Arum* or *Calla* again: here we must keep it growing all the year round, giving abundance of water throughout the hot weather; but I have never seen it flourish as it does in Australia, where, between the parched soil and the blazing sunshine, the plants get such a roasting, that from about February till July or August they are absolutely leafless, and get not a drop of water perhaps for months. Yet under these conditions I have turned a plant with two crowns out of a 6-inch pot into ordinary soil, and, without any attention, in two or three years' time it became a grand clump a yard across, bearing thirty or forty blossoms at a time!

The *Correa*, *Epacris*, *Ericas*, and other hard-wooded plants of Australia grow for the most part in a poor sandy loam, which becomes soaked and sodden during the winter or rainy season, and parched to an incredible degree in summer. In the "stringy bark" (a variety of *Eucalyptus*), where this class of plants is very abundant, the soil is generally a fine, nearly white sandy loam—just such stuff as builders like for making mortar; yet here we must grow them in peat, and give water with the greatest care during the season of rest. There Cucumbers and Melons luxuriate in the open ground, exposed to the full blaze of a tropical sun, and yet seldom, if ever suffer from red-spider.

The fact is, that it is simply impossible to imitate here exactly the conditions under which many exotic plants are found in a state of Nature. Temperature we can control, of course, and moisture also, both atmospheric and in the soil, at least to a large extent. Shade, too, we can give; but what about light and atmosphere? The limitless flood of dazzling light, the dry, crisp, tense, stimulating atmosphere of an Indian, an African, or an Australian summer, it is absolutely impossible to imitate here even in a faint degree. Fortunately for us, the set of conditions under which a plant is found to succeed naturally is not the only one in which it can

exist or even flourish: a largely different set will often answer the purpose nearly or quite as well, and sometimes better. Instead, therefore, of terming the constitution of plants generally singularly inelastic, I should say rather singularly elastic. Were it otherwise, we should find it impossible to cultivate many subjects at all in our climate. A knowledge of the normal conditions under which a plant is found is undoubtedly a guide to the treatment proper to it, but by no means an infallible one.

out moisture, which generally obtains in this country; the other the rest in intense heat, without moisture. Thus, in Mexico and some other parts of the world, plants remain dormant during the intensely hot season or summer, and bloom in the rainy season or winter. But is a resting period an absolute necessity after all? In the Sandwich Islands plants are growing, flowering, and fruiting all the year round pretty equally, and the time at which a crop, say, of Sugar-cane, or what not, is to be harvested, is

ploughed up, do millions of Eucalyptus seedlings spring up immediately where there were none before? *B. C. R.*

— A few years ago I took some young *Helleborus fatidus* from a chalky slope near Maidstone, and planted them in my sandy, sloping garden; every one of them died in winter, in spite of watering, &c. I then procured some more from Arundel of the same size, and also from a chalky slope, and planted

FIG. 32.—PLAN OF A GARDEN, ARRANGED BY MR. BAINEs. (SEE P. 191).

As regards the question of rest, that opens out, if possible, a still wider field for speculation or argument. It is generally regarded as an acknowledged fact in English horticulture that for almost everything a period of rest, as complete as possible, is desirable, and in many cases it is absolutely indispensable. But the conditions of such rest vary in a remarkable degree. Briefly, it may be said that there are two principal ways in which plants rest or hibernate—one in a low temperature, with or with-

determined by the season of sowing or planting. It seems to me that the elasticity of plant constitution—of Nature's laws, rigid as they are in many respects—is simply marvellous.

But Nature abounds in the marvellous. Why does the common Nettle almost invariably follow the footsteps of man, though unknown before? Why does white Clover almost always appear in soil that has been brought up from a great depth? Why, when a bit of land in the Australian bush is simply

them on chalk refuse (of whiting manufacture) about a foot deep. They are now vigorous plants, not only flowering freely from decumbent stems, but forming vigorous erect shoots for next year's flowers, after the manner of the plant. There is one tor on Dartmoor consisting of trap rock, known as Bochs Tor—the only trap hill on the moor—and at a limited range, neither above nor below, a belt round that hill, there grows a little moss, *Glyphomitrium Daviesii*, which grows nowhere else on the moor, and

is, I believe, nowhere found on other kind of rock. There is another little moss, *Dilymodon gemmaeus*, occurring only (so far as is known) in three counties in Great Britain, but invariably on thatch just beginning to rot, and capable of holding a limited amount of moisture, but it is found nowhere else. Now, these two latter plants seem to point out in almost speaking manner that the conditions by which their life is bounded are narrow, for they refuse to grow anywhere or everywhere, although two other mosses, *Funaria hygrometrica* and *Ceratodon purpureus* flourish almost anywhere and everywhere in the habitable globs. I doubt not, however, that there is a relation between the structure and chemistry of the plants and their life, regulated by laws of which we are ignorant at present, a plant may in one place meet with conditions which do not favour its vegetative growth, and its reproductive growth then develops at the expense of the vegetative or *vice versa* but the undue development of flowers can scarcely be considered (except by the horticulturist), a sign of the vitality or vigour of the plant any more than the numerous and often beautiful offspring of many consumptive mothers. An instance of the *vice versa*, is I think, the Horseradish, which I believe never fruits in this country. Some of the conditions of its life are met and it vegetates strongly, but it is like the little moss (*Elipodium Griffithii* which fruits freely near the summits of the Welsh mountains, but on the mountains of the Arctic zone barely subsists and produce only gemmae. At present we are like the doctors of past ages, who gave remedies which relieved or cured, "they did, but they didn't know why;" but now modern chemistry has shown what the action of the drugs was due to, and in a few cases has even proved how the active remedial agents are produced. The gardener has hitherto experimentally found out what suits various plants, but as Professor Huxley intimates, "The gardener doesn't know why the conditions do suit."

I must own I quite agree with Professor Huxley's objection about the word constitution as applied to a plant, just as I object to the term catalytic in chemistry, or cataplexy in pathology. A term like these often blocks the way to further enquiry. I believe in making the conditions of a plant as natural as possible, if you first ascertain carefully what those conditions are. For instance, if the Parsley Fern be planted with a "stone in the middle of the tuft," as some recommend, it does not do so well as if the natural conditions are exactly followed, viz., its roots in water which trickles under the stones. Anyone seeing some of the Australian plants growing in dry sand, and not ascertaining if there is water below, might naturally try to grow the plants in sand, and be surprised at the plants not growing in what was too hastily concluded to be their natural condition.

There appear to me to be conditions in every plant's life absolutely essential to its growth, and others not essential. Two of these I take to be temperature and degree of moisture. These may possibly be connected with the thickness or thinness of the cell-wall, as in the Oleander and Dahlia, or with the ratio between evaporation and absorption, as in the Lilac (where the stomata are said to be 160,000 to the square inch). I feel sure, with Professor Huxley, that the constitution is dependent on certain laws, and that so long as we are content with a word to cover our ignorance of these laws, we shall not investigate them. A.

— Of course, it is to be admitted at once with Herr Max Leichtlin, that "a gardener having a knowledge of plant geography, and the climatology of the various countries of the globe, is more likely to be successful in his empirical work than another who has no notion at all of the above sciences." Those words are self-evident enough; I only believe that they do not take one very far. If I were to put *Lilium Washingtonianum* dry, calcareous soil, or *Rosa berberidifolia* in a dark overhung spot at the back of my house, or *Saxifraga Vandellii* in stiff clay on the level, it is certain that the swamps of America, and the sandy stretches of Persia, and the

high Alps of the Tyrol, would rise up in judgment against me, and such malpractices would be condemned; but I submit that, with a knowledge by all that, many experiments may still be required before these three plants will be satisfied; and I venture to think that the surprises and mystifications of a garden are so great as to throw one on empiricism more than anything else. I dare say it may result in killing off a lot of valuable things (as Max Leichtlin seems to fear), but one would have gained knowledge of it so as to triumph in the end; so it has been here, I am sure, times without number. One of my greatest pleasures is to see plants growing quietly and vigorously at last, which used to cause me the utmost anxiety and bother. But this has come about only after experiments that were repeated again and again, and over the dead bodies, so to say, of many and many departed friends. I can only speak for myself, and the garden in which I have been working for more than twenty years. I remember when I began to make a collection of plants, and some new thing came into my hands, that I always made a point of questioning it about its original habitat, and I tried to find out from books what its natural surroundings are, and what therefore I imagined it would require. The next thing was to imitate those conditions in the most servile manner possible, and the next following upon that was to see my new possession fading away and perishing before my eyes. This made me think, and I could not help coming to the conclusion that there was a screw loose somewhere, if the expression may be used, which vitiated the proceedings altogether. The next effort was this: I have tried a difficult and heart-breaking sort of plant in several varying ways, and not infrequently it has succeeded in that which antecedently to experience I should have deemed to be the least likely of all. Here was a new revelation, and it led me at once to compare one thing with another, and to look for enlightenment alike in failure and success. If it be true, as Sir Charles Strickland says—and I think it is true—that "not only every species, but every individual plant has a constitution of its own which requires to be studied," it follows from it that incessant watchfulness, very careful comparison, and a sort of mental tabulation of different rates of progress, must be conducive to—or rather it should be said, indispensable for—any cultivator's success. Let me give an instance or two of what I mean. I suppose *Mutisia decurrens* is admittedly a very troublesome plant to manage; it is apt to look well one day, and it may the very next day be smitten like Jonah's Gourd to the ground. I have seen it at Kew, and then I have seen it not. It has well-nigh broken my heart times without number. When I consulted my books I could get very little more information about it than that it is a native of the Andes and New Grenala. As to complying with its own natural conditions, I might as well have tried to do so if it had been a denizen of the moon. What the whole thing has turned on in my case has been the prosaic matter of drainage. It is, however, rather a difficult one to decide, for too much drainage will dry it up, and starve it in that way, and too little may cause some stagnation of water about the roots, and that is fatal at once. The whole business is one of proportion, and nothing in the world that I can see could have made this plain, but experiment and failure, Intelligence from the Andes would not have been likely to say that a slight elevation of a few inches above the level of the ground is beneficial to this *Mutisia* in many gardens of England. Or to take another instance of the same sort of thing, only more direct perhaps to the point. Knowing, as everybody else knows, what a study Mr. Churchill has made of the Primulas of the Alps—and how great an authority he is with regard to them—and also knowing that he would be sure to help me if he could do so, I asked him about a year ago before making a rather large rocky for their reception, what hints he could give me regarding any special requirements. I have his very kind letter on the table before me, which gives the view of a most skilled and

accomplished botanist. It runs thus in one place, "I should say they do best between pieces of rock, with a minimum of soil for their roots to run into," and I dare say it may be so in the mountains, and this is all my friend had in his mind's eye when he was thinking about them—but then his point of view was not my point of view at all, and I was certain that death and destruction would have waited on them in my arid and burnt-up garden if I had squeezed them in that way. What they want here in my garden—and I speak of none other, for it is the only one I have tried—is a sufficiently retentive soil—and plenty of it to insure moisture in summer. Given only that, and of course shade, so as to make it to be possible, and Primulas do not any longer sigh for the Alps at all. But experiment only has made this plain.

The most forcible illustration, however, which I have to offer of my position comes from the Continent. As your readers are doubtless well aware, one great crusade of gardeners during the last few years has been the growth of *Cianthus Dampieri* with success. It is one of the most magnificent flowers in the world—but, hitherto, it has not been so amenable to culture as could be desired. The reason for repeated failure I believe has been that efforts were only made to reproduce Australian conditions in Europe, and this was found to be impossible. Now, however, the problem has been solved in a very simple manner. A nurseryman at Quedlinberg, near Berlin (Louis Vieweg) grafts *Cianthus Dampieri* on *C. puniceus*, and all difficulty is over at once. *Cianthus Dampieri* was the glory of a garden in Kent last year, and I trust it will be of mine during the ensuing summer. Its splendour is magical. The Dean of Adelaide told me a few days ago of the enchanting prospect he has beheld when a large tract of country was quite reddened with this glorious flower. It is only very certain, however, that *Cianthus Dampieri* never managed to produce such a wonderful effect by getting itself to be grafted on *C. puniceus*. The ingenuity of the Quedlinburg nurseryman has done better for it in Europe than any imitation of Nature could have done.

Sometimes it is to be admitted that experiments mock me, and then I am altogether adroit. I have always considered *Lithospermum Gastoni* to be a difficult plant to establish, and because of that it seemed well to try some three or four plants I lately received in widely different places, so that I might get on with perhaps one or two. But this time there was not a failure among them, and even leaf-mould upon the field seems to be quite as acceptable as the more orthodox and dry calcareous soil on an elevated spot. It is a mystery which I cannot unravel except by throwing myself on the dictum of Sir Charles Strickland, to which I have referred above. These prosperous specimens must have a far hardier constitution than any others which I received before. Instance upon instance might be given where plants seem to lose their proper characteristics altogether. The late Sir George Hutt always used to say that the way in which I grow *Rosa berberidifolia* with success differs *in toto* from the way in which he used to see it growing in Persia, and I am equally certain that the way in which he saw it growing in Persia would be destructive to it here. I have seen *Anemone vernalis* growing by the hundred in pure peat at the foot of the vast Glacier d'Otemna; but here it will put up with anything, and is not particular at all. *Polygala Chamebuxus purpurea* does far better in undulated leaf-mould than in anything else; but I suppose it never heard of such a thing before all the days of its life, and so one might run on to any amount. Plants seem to me to forget from whence they came, or, at any rate, to think little about it; and assuredly there is very often a fallacy when we think we have translated the conditions of one country into those of another. The price of all gardeners in Europe says that *Tropeolum speciosum* (*vide* p. 141) will not grow to the best advantage in a south-westerly position. There can be no doubt at all about that in Baden-Baden, and perhaps in Chili,

from whence it comes; but is he not confusing cause and effect? I submit that what *Tropeolum speciosum* hates so much is to have its little wiry rootlets dried up; and as bright sunny exposure is oftentimes conducive to that, it so far, but only so far, declines to submit to it; but take it to some very dripping locality, and where the rays of the sun have not the fierce violence which they evince at Baden or in the Isle of Wight, and it will surprise me if *Tropeolum speciosum* will think much about a difference between a northern and southern situation, excepting that it will like the latter the better. If an inhabitant of the Orkney Isles went to Chili for his servile imitation about this plant, I suspect that he would find out his mistake. But before many weeks are over, I hope to be enlightened about a great many things at head-quarters from Max Leichtlin himself.

With regard to the two instances which Mr. Elwes has given, I have been told—though I have not yet tried it myself—that nothing improves *Cypripedium spectabile* so much as copious libations of manure-water, but surely it must be innocent of all that in its own native woods, and the best *Disa* I ever saw was growing in water, though I never heard of its being counted as an aquatic—so elastic as it, however, with regard to this point.

When Professor Mehan of Philadelphia, U.S.A., was last in England he visited my garden, and what seemed to strike him more than anything else was the way in which *Cypripedium spectabile* succeeds in it. He said "We cannot grow it so well in America."

Now it is certain that no black peat or peat of any sort is used for its sake, and yet according to the American professor there is nothing left to be desired about the matter at all, or as it might be more strongly put, we can by the aid of experiment grow *Cypripedium spectabile* much better in this country than it can grow itself in its own home. I have seen precisely the same thing happen with plants in other places. I am sure that *Hamondia pyrenaica* a few years ago was quite as happy in Mr. Hammond's hands at St. Alban's Court near Catterbury as it is in the Pyrenees.

I know that Mr. Elwes is a most accomplished traveller and botanical gardener, and I wish he would teach me many things; but I cannot help thinking that it is just because he is so well acquainted with the habitats of different plants that he tries to imitate them too narrowly. I suppose it is the totality of their surroundings which is the really important thing that plants have to consider, and perhaps one thing out of gear disarranges and neutralises all the rest. At any rate, I am not much of a believer in a successful imitation of Nature when it goes to great lengths. I think that some empirical adaptation of the means that we have at command to the wants of our plants is more likely to answer—if not at once—yet still eventually it will be so, and the whole business in my eyes comes to this: we must interrogate our favourites by day and by night, month after month, and year after year; it is a matter of sympathy and devotion to their wants more than anything else, and if they do vouchsafe to tell us a little about their desires by a sickly appearance or sudden death, which sends us into mourning at once, or by their radiant smiles which serve only to captivate and delight, we must alter our methods accordingly, trying this and then trying that. We must be ready to change, modify, and improve, we must be bound to no *a priori* conclusions whatsoever, and I for my part humbly throw in my lot with the Director of Kew Gardens, and I think he was quite right when he said that "the conditions under which plants exist in Nature afford very little information for cultural purposes." *Henry Eckbank, Hyde, L. W.*

—The information afforded by travellers and botanists as to the conditions under which plants live is usually very imperfect, and useless to the gardener. Many botanists are deficient in a knowledge of the conditions of plant life. A well-known

botanist held the opinion that Orchids should not be syringed, because he considered the spongy aerial roots to have the faculty of condensing moisture, and his Orchids would have perished had the gardeners not syringed the plants surreptitiously. It was wrong to put *Impatiens Sultanii* in a dry stove (p. 117), merely because it grows in Zanzibar; where it springs up in the rainy season. So the roots of the *Naras* do not grow in the burning sands—they descend beyond them into moist soil. *A German Professor.*

TREES AND SHRUBS.

CEDRUS ATLANTICA FASTIGIATA.

M. CARRIÈRE, in the *Revue Horticole*, figures and describes a pyramidal form of the Atlantic Cedar, with branches ascending like those of the Lombardy Poplar. It is a seedling, raised by M. Lalande, of Nantes.

- SOBRALIA XANTHOLEUCA, *Revue Horticole*, January 1.

ODONTOGLOSSUM PESCATOREI.

[SEE SUPPLEMENTARY SHEET.]

The remarkable example of *Odontoglossum Pescatorei* shown in the Ink Photograph is from the collection of Mr. J. B. Mirrieles, of Redlands, and was grown by his gardener, Mr. George Russell. The flower-panicle measured 1½ feet from base to apex. The first branch of the panicle was 18 inches up the stem, and that and a good many others of its immediate attendants, were also branched; in fact, there were fourteen racemes ranged up the stem, with twenty subsidiary ones from these lateral branches, the complete inflorescence containing 130 blooms! Mr. Russell says he has grown the plant six years; when he got it the bulbs were the size of beans; now they are quite as large as hens' eggs, and large ones, too.

This is an example of cultivation, when one looks at the plant and to surroundings, that begets a certain amount of reflection. Cultivation, as we generally understand it, looking at cereals, or root-crops, or Vines, or Peaches, or Apple trees, or Dahlias, *Chrysanthemums*, *Pansies*, or, in fact, most plants grown either for profit or effective display, is largely the work of the nutritive forces presented for root-feeding below ground. Of course, light and sunbeams must be there in sufficient force to aid the underground work in finishing the desired outcome. But here is quite a converse case. The feeding particles in the small area of a 9-inch pot do not of themselves materially aid this, what might be called unique development of blossoms. There are thousands of plants all over the country as well served in that way with fibrous peat, sphagnum, and potsherds; but the outcome of cultivation is not the same, even by approach. Doubtless there are some varieties, as we all know, of many species of Orchids far more floriferous than others, but a panicle of 130 flowers surely is wonderful, even with all our advancing skill, and is something to aim at. It is not a *lusus nature*, I maintain, but well considered, well balanced, skilful cultivation.

All plants under glass, and living in a forced

atmosphere, are liable to the invasion of a host of insects; in fact, they are as much heirs to troubles of that kind as mankind to the troubles and their complications that they require to endure. Shutting the door against invaders of that kind will help to finish up a first-rate article in the matter of efflorescence, but it will not accomplish the manufacture of such a pseudobulb, and the evolution of such a quantity of flowers, as in this *Odontoglossum Pescatorei*.

What appears to me to be the potent working element in building up this consolidated mass of matter is the cool, very cool and moist summer temperature. Although *O. Pescatorei* is a continuous grower throughout the year, it seems to swell up its pseudobulbs in June, July, and August in greater degree than in the other months of the year, only it cannot endure a high or dry temperature during the months that are named; hence why cultural successses are not more general. All these Alpine Orchids, coming from barrancas 6000 to 8000 feet in the Andes of New Granada, live more upon "climate," so to speak, than upon "soil." Mr. George Russell evidently understands this, and his success with that and other species from cool regions is very pronounced, and does him very great credit. *James Anderson.*

A HISTORY OF ENGLISH GARDENING.

(Continued from p. 74.)

GARDEN-FLOWERS OF THE TUDOR PERIOD.—THE following list contains the names of all the garden plants that are known to have been cultivated in the gardens of the early Tudors. The notes have been taken from contemporary sources, and they are in all cases quoted directly from the authorities named:—

Acanthus.—"Growth plentifully in my Lordes garden at Syon." (Turner, *A New Herbal*, 1531.)

Alliod. (Asphodel).—"And now I have it in England, in my garden from Italy." (Turner, 1531.)

Almond.—"Groweth in Italie and Highe Germany in the fields, but in England ouly in gardens." (Turner, 1518.) "Some growe in England, but I have heard of no great store of the fruit of them." (Turner, 1531.)

Apples.—"They were sold by costarmongers in the streets of London (Skelton, *Poems*, vol. 1, p. 109), and fetched about 7d. the hundred (Brewer, vol. ii, p. 131). Several varieties were known (*Greta Herbal*, see under "Cherye"); but only Costards, Pippins (Roger's *Agric. Treas.*), and Queenings (*Henry VIII. R. of P.*, 1520), are named.

Apricots.—"Introduced in 1524 by Wolf (see Gough's *British Topography*, vol. 1, p. 133). "We have very few of these trees as yet." (Turner, *Names of Herbs*, 1518.)

Artichokes.—Turner (1518) mentions "gardine Artichokes," and they appear to have been extensively cultivated (*Henry VIII's P. P. Exp.*, 1533).

Asarum.—"It groweth in England onely in gardines that I wote of." (Turner, 1518.)

Asparagus.—"In England it groweth nowhere else that I knowe of but in gardens." (Turner, 1518.) "Let growe two years and remove." (Tusser.)

Auricula.—They are mentioned under their old English name, "pazzles," by Tusser. Two varieties were known—the "grene" and the "yellow."

Barberry.—"Berberis growe wyde in the hedges and woodes in Germany, but in England only in gardines." (Turner, 1518.) The fruit was much esteemed; a present of "Berberis" from "a poore woman" is mentioned in *P. P. Exp. of Henry VIII.*, 1522, p. 258.

Batchelor's Buttons.—Mentioned by Tusser among the common garden plants.

Beet.—"Groweth in England only in gardines." (Turner, 1518.) The plants were grown in pots:—

"Fine Bazell desiredh it may be live hot
To growe as a Gilleflower triu in a pot."

Tusser.

Bay tree.—"Bai-trees are common in gardins in the south part of England." (Turner, 1518.)

Beans.—Mentioned by Tusser, and very extensively cultivated in England at this period,

Beet.—"Beetes growe in England, as farre as I knowe, in gardines only." (Turner, 1548) "This herb is common, and groweth in gardaynes." (Maeger.)

Borage.—Mentioned by Tusser among his garden herbs. "Groweth in gardaynes." (Maeger.)

Bitles (Amaranth).—"I have seen it growing in my Lordes gardines at Shene." (Turner, 1548.)

Bullaces.—Tusser mentions among his orchard fruits two varieties: the black and the white.

Cabbage.—Mentioned in the *Grete Herbal*, and also by Tusser. Turner has a good figure of the plant in his *New Herbal*.

Camomile.—"In Englande so plenteous that it groweth not only in gardines, but also ijij miles above London it groweth in the wyld field." (Turner, 1548.) Maeger (1528) says that it "groweth moste in gardines."

Cardo Benedictus (Blessed Thistle).—"Groweth nowhere in England that I knowe, but in gardines." (Turner, 1548.)

Carrots.—"Carrettes growe in all countries in plentie." (Turner, 1548.)

Cherries.—"Of them ben many different manners in taste and goodnes as there ben of Peas and other fruyte." (*Grete Herbal*). They were very widely cultivated, and varied considerably in price. In 1525 they were as much as 1s. a lb. (Roger's *Aric. Prices*), whilst in 1542 they were sold for under 1d. a lb. (*ibid*). In 1533 some 100 trees were sold for 6*l*. (*Chapter House Accts*). Presents of choice Cherries were often sent to Henry VIII. and his household, and there are many entries in his *Privy Purse Expenses* which refer to these. One entry is especially interesting: "1530. 5 June.—Item to the servant who brought a present of Cherries to my Lady Anne from the Mayor of London, vjs. viij*l*." (p. 48). In the *Privy Purse Expenses of Princess Mary* (p. 159) is one item: "Cherries to make conserves."

Coleworts.—"This herbe is comon and groweth in gardaynes." (Maeger.)

Coloquintida.—"Groweth only in gardines in England." (Turner, 1548.)

Cornflowers, called by Tusser "botles." He mentions three kinds: "red, blew and tawnie."

Cowslips.—Mentioned by Tusser among the garden flowers cultivated in his time.

Cress.—"Growe nowhere but in gardines." (Turner, 1548.) "Sowe with letuse in spring." (Tusser.)

Cucumbers.—"In England groweth only in gardines." (Turner, 1548.) "Plant in April." (Tusser.)

Currants, Red.—"Rybes is a reed berry growing on a lytle small tree." (*Grete Herbal*.)

Cypress.—"Growe in greete plentie in my Lordes Graces gardines at Syon." (Turner, 1548.)

Daffodils.—Mentioned by Tusser.

Daisies.—"Of all sortes." (Tusser.)

Dracunculus.—"Groweth only in gardines in England." (Turner, 1548.)

Eglantine.—"Groweth much in gardines in England." (Turner, 1548.)

Fennel.—"Groweth in gardines in all countries." (Turner, 1548.) Borde says, "This herbe is seldom used, but its seedes be greatly occupied."

Fetherfew.—Mentioned by Tusser.

Figs.—"There are divers Fig trees in England, in gardines." (Turner, 1548.)

French Broom.—"Spartium, a bush called of some gardeners, Frenche Broome. It is found now in many gardines in England, in my lordes gardine at Shene, and in my Lord Cobham's gardine, a lytle from Graves End." (Turner, 1548.)

French Mallow.—Mentioned by Tusser.

Garlic.—"Groweth in gardines only. . . Ramsey variety groweth also in gardines." (Turner, 1548.)

Galingale.—"Groweth in my gardine in England." (Turner, 1548.)

Germander.—"In England I sawe it nowhere syving only in gardines." (Turner, 1548.)

Gilliflower. A very common plant in the early Tudor gardens. "Stippes of Gilliflowers" were purchased in 1533 for planting in the Royal Gardens at Hampton Court. Tusser mentions three kinds—the "red, white, and Carnations," and remarks that they should be "set in spring in pots, pails, or tubs, and planted out in somer in beds."

Gooseberry.—"I groweth only that I have seen in England in gardines." (Turner, 1548.) It was cultivated in some of the Royal gardens belonging to

Henry VIII. in 1516. (Brewer, vol. i, p. cxxv.) Tusser says that the bush should be planted in September.

Hollyhock.—Mentioned by Turner (1548), and also by Tusser among the garden plants of the period. The latter author mentions three varieties, the "red, white, and Carnation."

Hyssope.—"Groweth in gardines only in England as far as I have seen." (Turner, 1548.)

(To be continued.)

ORCHID NOTES AND GLEANINGS.

LELIA ANCEPS DAWSONI AND ITS VARIETIES.

I HAVE had an opportunity of seeing a very large number of varieties of the white *Lelia anceps* in Mr. Holbrook Gaskell's, Mr. A. Heimes', and Mr. George Hardy's collections—not small pieces, as in days gone by, but in reality comparative donkey-loads; and although there are numerous little bits of variety in the way of colour, and in the way of length of segments and breadth of labellum, there is nothing, in my opinion, to warrant such a multiplicity of names, as really they are all more or less forms of *Lelia anceps* Dawsoni. They are no more entitled to be called *Stella*, *vestalis*, *Schroederiana*, *Sanderiana*, &c. —we mean as tending towards clearing up the confusion in Orchid nomenclature—than any variety of *anceps* itself, or any of the numerous forms of *Odontoglossum* which certainly would not be tolerated unless they were supremely good forms. Of course, every one is entitled to christen his "ain bairn."

The best cultivated and the best flowered plant of them all is at Woolton Wood. It bears seven scapes each five-flowered, and is a gem of the first water, as can easily be conceived, with thirty-five fully expanded flowers upon it. (Is this not the best flowered plant in collections?) This one is named *Schroederiana*. Another one, called *vestalis*, is quite identical with the *Schroederiana*, and both were named by the late Professor Reichenbach himself. Of course, with the limited material before him, and the different styles of culture, there might also be slight variety; but there is not the slightest doubt of the two plants being identical, and there was plenty of material to compare with and judge from, being no less than ten good varieties, and in all about eighty flowers. The one named *Sanderiana* is a much smaller form, has a smaller lip, and is not a form that we can look upon as being equal to those named above, although it has a better and higher coloured blotch in the lip.

It is now well into the end of the third decade since we first flowered and described *Lelia anceps* Dawsoni, and from that day to this we have never had any difficulty in identifying the plants either in flower, or out of flower. Mr. George Hardy has some very nicely-grown plants from the original stock; he has also a plant—quite a barrow-load, in fact, of one named *Schroederiana*—which is identical with Mr. Gaskell's *vestalis*, &c. Not one of the forms that have come under my observation equals the original one for broad petals—so broad, indeed, as to close well into its sepaline fellow. Its lip, too, is equally characteristic for breadth, and the blotch is much more solid, and better defined than that figured in the *Orchid Album*. The colour of the upper portion of the labellum does not prominently shine through as indicated in that work. Doubtless among the many in commerce we shall have varieties turning up with the form, substance, and general features of *Lelia anceps* Dawsoni, possibly better, but none yet have come up to the florists' standard of that valuable *Lelia*. The *Schroederiana* form covers a large area, but it wants form, and the solidity of that fine purple blotch that so distinguishes the flower of the one that was dedicated to my late distinguished employer and friend, Thomas Dawson, J. A.

GOODYEBA DISCOLOR.

This little Orchid is the gem of the whole family, Ranking with *Anactochilus* in the beauty of its leaves (especially if the variety *Dawsoniana* be included), it has the additional merit of producing very pretty flowers; it is also easily grown. The leaves are of a deep velvety-green above, and of a purplish tinge underneath; they are divided obliquely by a white midrib. The spike is erect, and bears a dozen or more flowers, all the parts of which are pure white except the column, which is yellow, and, together with the lip, is curiously twisted, and in this respect resembling a *Mormodes*. It may be grown in an ordinary moist stove, potted in peat, with a little sand and chopped sphagnum moss mixed, and freely supplied with water. Propagation is effected by cutting the rooting portion of the stem into lengths. It is now flowering in the warm Orchid-house at Kew.

EPIDENDRUM WALLISII.

There are not many species belonging to the huge genus *Epidendrum* of which so much can be said in favour as this. It was introduced from New Grenada a few years ago, and has not as yet become common; but as importations continue to arrive, and its cultivation is better understood, it will eventually find a place in most collections. It belongs to that section of the genus with tall, slender, leafy stems, which, in this instance, are 2 to 3 feet high, and rendered distinct by the small black-purple, warty dots with which they are covered. The sweetly-scented flowers are produced from the apex and at the upper nodes. The sepals and petals are of a rich yellow, marked with a few crimson spots; the lip is broad, and fan-shaped, yellow at the base, the greater portion being white, beautifully pencilled with rose-purple lines. The column is of the same rich yellow colour as the petals, and the whole flower measures 1½ inch across. The flowering season of this species extends over several months. A plant at Kew has been in bloom now for a considerable time, and still continues to push forth flowers. It should be grown in the Cattleya-house, potted in peat fibre and sphagnum moss, and kept moist at all seasons. Trips are very apt to settle in the points of the growing shoots; it is advisable, therefore, to occasionally use tobacco-powder to dislodge them. W. B.

A FINE LYCASTE SKINNERI ALBA.

In the collection of D. Henderson, Esq., Grace-mont House, Liberton, Edinburgh, there is in flower a plant of *Lycaste Skinneri* alba, with twelve spikes, showing thirteen flowers. Is this in any way unusual? Two of the flowers spring from one stem. The flowers are very fine ones. *James Hallett*.

CYPRIPEDIUM FROM LIVERPOOL.

The collection of Reginald Young, Esq., Sefton Park, Liverpool, now boasts of over one hundred species and varieties of *Cypripedium*, and flowers sent show that the culture of the plants is well understood. Specially interesting are two forms of *C. Harrisonianum* ×, and two of *C. callosum*, which go far to demonstrate the wide difference sometimes to be found amongst forms of the same plant. The hairy warts on the upper side only of the petals of *C. callosum* make a feature which distinguishes it from *C. barbatum*, and in one of the forms sent by Mr. Young, these are in one flower confined to three bearded warts only, while in the other the warts extend along the whole length of the petal. Two flowers of *C. villosum* were also very fine, also those of *C. Mearesianum* × and *C. lo grandis* ×, present those fine hybrids in a good aspect. Sprays of *Dendrobium Ainsworthii roseum* ×, and *D. Leachianum* ×, represent the latter as the better variety; and a curious *Odontoglossum Rosii majus*, with pale green spotting; some fine flowers of *Oncidium splendens*, *Sophronitis grandiflora*, and *Angraecum eburneum* are included.

AÆRIDES VANDARUM.

I do not remember to have seen noted the exquisite Lily of the Valley fragrance of this species. A specimen of the plant bearing several sprays of pure white flowers, 2 inches in width, is in bloom at Mrs. Brightwen's, The Grove, Stanmore, under the care of Mr. Odell. It is in growth similar to *Vandalaria*, and its membranous flowers are unlike those of any other *Aerides*, although the botanical features are those of the rest of the genus. *J. O'B.*

CYPRIPEDIUM RUBRUM TISSIMUM.

A noteworthy example of this fine old species is now in bloom in the Barford Lodge collection, under Mr. W. White's charge. It has ten flowers on six spikes. Instances of twin-flowered *Cypripediums* often occur, but four examples of it on one plant is an occurrence of some rarity. *J. O'B.*

ORCHIDS AT GLENTHORNE, HARROW WEALD.

The pretty conservatory adjoining the residence of Alfred Borwick, Esq., furnishes an admirable example of the usefulness of Orchids when well grown for arranging with other plants; indeed, the bulk of the display in the conservatory is obtained by the employment of Orchids. In the background is a large flowering white Indian *Azalea*, with some smaller *Azaleas*, and the soft-tinted *A. mollis*; and at the sides are *Callas*, and plants of *Dendrobium nobile*, *D. Ainsworthii*, and *D. Wardianum*. With these are dozens of fine plants of *Lycaste Skinneri*, some of the specimens bearing from fifty to sixty flowers; and about thirty plants of the best variety of *L. Skinneri alba*, of which some half-dozen are still in flower. A double row of well-flowered specimens of *Coleogyne cristata*, among which the *Chatsworth* and *Treutham* varieties were distinguishable, surrounds the groups, and these again with Maidenhair Ferns, the whole having a fresh and charming effect.

Among the plants in the Orchid-houses, many noteworthy things appear, and especially two specimens of *Cymbidium Lowianum*, with five spikes each, one with 110 flowers, and the other 108. The *Lycastes* and *Cymbidiums* grow to great proportions, which Mr. Gilks, the gardener, attributes in a great measure to the use of "Jensen's Fish Potash Manure" when the plants are actively growing. Apart from this, the *Lycastes* at Glenthorne are potted in soil of about the same nature as that in which *Hycacinths* are usually potted. This kind of fish manure has been given to most growing Orchids in Mr. Borwick's collection for some years, and with increasing success. Doubtless many who have tried the substance have erred by continuing its use after the growths of the plants were fully made up. In a cool frame in front of one of the Orchid-houses stood a large batch of *Sophranitis grandiflora* in remarkably healthy condition, the pans in which the plants were growing being almost hidden by the growths. *J. O'B.*

ORCHIDS AT CHRITON, BRACKENHAM.

Orchids are numerous and well grown by H. C. Marks, Esq., at Chriton, Brackham, Kent. In the several houses devoted to them a correspondent states there are now in flower *Lycaste Skinneri Mesurensiana*, with fourteen flowers; *Cypripedium Leeanum superbum* has about twenty-four flowers; *Dendrobium nobile nobilior* is a fine plant, good sized flowers, and well flowered; the plants of *D. Wardianum* are nearly all of the giganteum type, and are well done by Mr. Cross, the gardener; *Odontoglossums* are equally well grown, and have a house to themselves; *Oncidium Kramrianum* is one of the largest as well as darkest flowers, and is a very striking object. *Oncidium varicosum Rogersii*, the true variety, is another beautiful Orchid. Our correspondent kindly sent a long list of Orchids grown or in flower in Mr. Marks' garden, but as it is wholly destitute of critical remarks, we must demur to its insertion, although it shows that the selection of species and varieties is an excellent one.

PLANTS AND THEIR CULTURE.

MISCELLANEOUS ITEMS OF THE STOVE.—Cuttings of varieties of *Coleus* may be taken and inserted singly or several together in light sandy soil, and when rooted the old plants may be thrown away. *Poinsettias* in pots, &c., after flowering should be placed on their sides in an intermediate house, and receive no water. Seeds should now be sown of *Gloxinia*, *Begonia*, and *Impatiens sultani*, and the plants from this sowing will be of great use if well grown. A sowing of the *Torenia*s in variety may now be made; these plants are invaluable for filling baskets, or placing in the front of the stages, and they remain a long time in beauty if removed to a cooler house when full grown. Seeds of any kind of stove plants requiring a long time to germinate should be sown at once.

Amaryllis (*Hippeastrum*) seeds should be sown at this date. The bloom of the earliest *Amaryllis* will soon be over, and the bulbs should be repotted, very carefully watering them for a time, and giving them abundance of light to prevent the foliage getting drawn. A compost consisting of good yellow loam, a little leaf-mould, and good rotten manure, with a small quantity of coarse sand, should be used, and only a slight shift be given. If several bulbs are together in one pot, it is best to divide them, rather than over-pot. The soil round the bulbs should be made very firm, plenty of space for water being left. Cuttings of the useful *Euphorbia jacquinioides* should be put into the propagating bed as early as possible, the old stock plants being kept rather dry for a few days before removing the shoots; I find that doing this prevents the damping off of the cuttings. The cut surface of the cuttings should be allowed to get dry before inserting them. Well coloured young shoots of *Crotons*, if taken off now, make nice plants; and *Draenas* which have lost their lower leaves should have some moss placed round them near the bottom leaves, and be kept moist, when they may be taken off in a few weeks. When rooted and potted off, a little bottom-heat will push them on rapidly. The old stools will produce a number of young growths, which should be taken off and placed singly in small pots in bottom-heat; these will soon strike, and should be grown in bottom-heat for a few weeks. *Geo. Wright, Sign. House.*

FRUITS UNDER GLASS.

THE PINKERY. Thoroughly overhaul the different departments, washing the glass and woodwork with soap and water, and the brickwork with a wash of hot lime, in which a little flowers-of-sulphur is put, and give the annual coat of boiled linseed oil and lamp black to bottom heat and other hot water pipes, as a preservative against rust. Destroy with scalding water obnoxious insects and their haunts, these are spiders, crickets, cockroaches, and woodlice. Respecting bottom heat for Pines, there is nothing better than a bed of good Oak leaves and tan, although the renovation of the beds is attended with the risk of too great heating at first. It is this danger which has given rise to the modern system of hot water pipes with less tan or leaves over them, and which ensures to the grower the most complete control over the warmth furnished. Whichever system is adopted, a small quantity of the most decayed portion of the materials should be sifted out and removed, it being replaced by new, in order to secure a lasting heat ranging between 75° and 90°. If a point beyond 90° is reached, "cupping" and elongation of the leaves takes place, which are sure signs that the roots now having their feeders at the outside of the pots are suffering. By way of relief, the pots should be rocked backwards and forwards a few times, holding the plant firmly at the time, which will allow of the escape of some of the heat. The cavities thus formed, should be filled up again with a rake when the heat has subsided to a safe point.

Fruiting House.—Plunge any Queens showing, and those expected shortly to show, fruit at the warmest end of the bed, these being slightly more delicate, and taking less time to mature than the *Charlotte Rothschilds*, *Cayennes*, and other large fruits. Press a little turfy loam round the collars of the plants, to steady them; to any that are unduly dry, put some kind of mark, so that it may be known which are those that require more water later on. A practised hand will readily detect this by the weight when

handling them. The gentle check caused by replanting will at once cause many plants to show signs of flowering and root activity, and all such should receive copious supplies of warm guano-water, the strength of which may be increased from time to time. With the increase of light, let the humidity of the house increase, and afford the plants a dewing over daily, but beware of filling the axils of the leaves with water. Night temperature 70°, or a few degrees less in frosty or windy weather; day temperature may reach 90°, if a little air be put on early in the day. I prefer to give a little side ventilation, if the air pass over the hot-water pipes, and trust to evaporation by means of the laps of the glass, &c.

Succession-houses may be filled up with plants potted in September last, and treated similar to the above, excepting that a few degrees less warmth be given, especially at night, with a little freer ventilation during the day, to prevent the drawing of the leaves. In potting suckers, give ample drainage, and place the plant on a firm seat, with compost made firm with the potting stick. Rather than detach small suckers from stools, we prefer to await their further growth. Detached, newly potted suckers should be kept humid in an intermediate temperature till rooted. Take care of all approved old stools for stock purposes, discarding any of the narrow-leaved or deteriorated plants, for it is only the healthy suckers which will ever make good plants.

Pot Vines.—Any of these which are now thinned, may be safely urged onward with liquid manure, giving a temperature of 70° at night. Keep a little front ventilation on if the air can be passed over the pipes, and a day temperature of 80° to 90°, with a genial atmosphere. The early permanent Vines will now be in flower, and the house may be kept slightly drier, but do not remove any shoots during the setting of the blossoms. Shake the rods daily, and if Madresfield Court is amongst the Vines, save some of the falling pollen from the Black Hamburgs on a piece of clean paper, for the purpose of fertilising the former. In doing this, first draw the dry hand down the bunches of Madresfield to remove the globules always present. The variety is apt to produce seedless berries unless this be done, but the cracking of the berries is extremely rare when forced early. When the Grapes are sufficiently advanced, and the best placed as well as the best set bunches have been selected, all superfluous clusters should be removed, preparatory to thinning the berries. Ventilate as advised for pot Vines, and maintain a night temperature of 55°, and by day of 65° to 70°. Inside borders must be frequently examined, and if found necessary they should be watered previous to the flowering period with tepid water. The roots are not active enough as yet to take manure water. *W. Cramp, Madresfield Court.*

THE KITCHEN GARDEN.

SOILING OF SEEDS.—The uncertainty of the weather at this season of the year frequently delays the sowing of Peas and other seeds. Marrow Peas seldom grow satisfactorily when sown very early in the year, the cause being that moisture and low temperature suspend germination so long that decay ensues, and this is especially the case when the seed is old. If, however, the soil be in good condition, a sowing should be made of Telephone or Marvel, which will form a succession to the first-sown round Peas, and be ready for use early in July. From now onwards, sow the seed in well-prepared trenches, plenty of manure being put at the bottom of these. Peas sown in pots must be kept near to the glass in cold frames, airing the plants freely on fine days. Peas showing above-ground should be slightly protected with Spruce boughs, or have a few crumbs of earth drawn over them; and if slugs are troublesome, dust the rows frequently with lime, soot, and dry wood-ash. Put black threads over the rows, if birds are pecking the plants.

Beans.—A sowing of these should be made without delay, which may consist of Mazagan, Longpod, and Green Windsor. Bunyard's Prizetaker should be afforded a trial, it being a fine pod, and likely to become a favourite with gardeners. Sow the Windsor Beans in drills 2 feet apart, placing each Bean at 6 inches apart in the rows. If double rows are sown, they may be 3 feet apart. For this crop a somewhat strong soil in good heart is the best. *H. Markham, Menworth Castle, Morriston.*

EDITORIAL NOTICES.

Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor. Such communications should be written on one side only of the paper, and sent as early in the week as possible.

Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are also solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

MONDAY,	FEB. 17	Lilium auratum, and Greenhouse Plants, at Protheroe & Morris' Rooms.
TUESDAY,	FEB. 18	Roses, Greenhouse Plants, &c., at the City Auction Rooms, by Protheroe & Morris.
WEDNESDAY,	FEB. 19	Roses, Fruit Trees, Shrubs, Border Plants, &c., at Stevens' Rooms; Lilies, Greenhouse Plants, Seeds, &c., at Protheroe & Morris' Rooms.
THURSDAY,	FEB. 20	Imported and Established Orchids, Lilliums, &c., at Stevens' Rooms; Nursery Stock from Sample, at Protheroe & Morris' Rooms.
FRIDAY,	FEB. 21	Imported and Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—39°·3.

The annual meeting of the Society took place on Tuesday last, when the proceedings passed over harmoniously and pleasantly. The meeting was well attended, and no objections were raised to the balloting lists, so that Sir TREVOR LAWRENCE, D. MORRIS, and Rev. W. WILKS, remain as President, Treasurer, and Secretary respectively; while Messrs. E. A. HAMRO, MARTIN SMITH, and N. N. SHERWOOD become new Fellows of Council in place of Messrs. BOURNE, COLEMAN, and SMEE. Two of the new Councillors are not known to horticulturists, but let us hope will speedily become so. Mr. SHERWOOD is a real acquisition as a business man, familiar also with one very important branch of horticulture. Mr. COLEMAN'S resignation is a loss, but it is not surprising that the distance at which Mr. COLEMAN resides should render it difficult for him to attend. Mr. BOURNE, who hails from no further off than Covent Garden has, we believe, been replaced on the ground of infrequent attendance.

It will be seen that the balloting list emanated from the Council only, and that the Fellows did not exercise their right to nominate anyone on their own behalf. This circumstance suggests the propriety of the Council taking steps, every year, to remind the Fellows of their duties. As it is, the matter is forgotten till it is found that the proper time has passed. Due notice should be given, for it is not possible for the Fellows to remember the precise date at which it is necessary for them to exercise their privilege.

In his Presidential Address, Sir TREVOR pointed out the necessity of increased public support, alluded to the good work done at Chiswick, and at the several Conferences. As an instance of the value of the Chiswick trials, he instanced the reduction of the number of varieties and synonyms in the case of Tomatos from 100 to 30. Experience was not favourable to Chiswick as a place for holding meetings, as the public did not attend. The meetings at the Drill Hall were of a very interesting character, and would be continued in that by no means ideal building until more suitable premises could be found. The thanks of the Society were tendered to the several lecturers at the 3 o'clock meetings, and to the members of the several committees. The Scientific Committee, it was pointed out, comprised no fewer than seventeen Fellows of the Royal Society.

A well deserved tribute was bestowed on the Secretary and Treasurer for their labours on behalf of the Society, and allusion made to the losses sustained by the Society in the deaths of Rev. M. J. BERKELEY, Professor REICHENBACH, Mr. WILDSMITH, and others.

The Treasurer pointed out the privileges which each class of subscribers received in return for the subscription paid, alluded to the condition of the library, and to the improvements effected at Chiswick.

Baron SCHRODER, in a speech of some length, that was most attentively listened to by the company present, told them what in his idea the Royal Horticultural Society ought to be, and ridiculed the idea of it staying much longer at the Drill Hall. Two meetings, he said, had already been called to elicit opinion as to the manner in which money could be raised to build a hall for the Society; and his proposal, which seemed greatly favoured by those present, was, that the Fellows and the outside public should be invited to subscribe £30,000 to £40,000, the Press, the Fellows, and the trade, taking a leading part. The money so raised to be invested, as regards one half, in first-class securities, so as to bring in 3½ per cent.

The interest from the funded money would pay the ground rent; and two years after the completion of the building, repayment by means of bonds would commence. The Society would, in fact, become the tenants of the bondholders, paying for the accommodation afforded £400 a-year.

The scheme was highly approved of, and about £200 was subscribed in the room, the Baron heading the list with £1000. It was proposed that gardeners' charitable organisations and other horticultural societies should meet in the new hall, and secure offices there; also that the hall should, as far as was consistent, be put to various uses so as to secure an annual income.

The Baron was in earnest, and his speech not only interested his auditory, but stirred them to something very like enthusiasm. It must, however, before all things, be made clear that the Society, as such, is to be free from any entanglement such as worked such havoc at South Kensington, and this made sure by all means let us have our Horticultural Institute, and infuse a little cohesion among the horticultural units. As to site, the Baron stated that he knew of one, very central, where every city man would see it; but nothing further was divulged on that head. The advantages of the Hall to the City man who cared for Orchids and other plants—and many of them did care,—as a place where he could go and see flowers for such a small sum as the Society demanded was enlarged upon, and it was exceed-

ingly pleasant to hear Baron SCHRODER say how willing he would be to give his services on the committee, act as Trustee of the fund, and do his best to get money from his friends.

Dr. Hogg spoke in favour of the scheme, and was delighted that such a scheme had been unfolded. Other speakers followed in the same vein, and the prospects of securing a fitting home for the Society are decidedly bright.

ROYAL HORTICULTURAL SOCIETY.—Baron Schroder's proposal as to the erection of a suitable Hall for the Horticultural Society met with a warm reception, and in the course of a few minutes, after the meeting was over, and many gentlemen had left the Council room, spontaneous offerings amounting to £2600 were made towards its erection. The following gentlemen promised contributions to the fund:—Baron Schroder £1000, Messrs. F. Sander & Co. £200, Messrs. S. Courtauld, N. N. Sherwood, and H. J. Veitch, each £150; Messrs. P. Crowley, T. B. Haywood, Dr. Hogg, C. Mordaunt Matthews, and H. M. Pollett, each £100; Messrs. G. Deal, John Laing & Sons, G. Paul, H. J. Pearson, T. F. Rivers, and Rev. W. Wilks, £50 each; Messrs. J. Douglas, H. Cannell & Sons, Mr. John Treble, and Messrs. Sullivan, £25 each; Mr. George Bunyard and Mr. Charles Toope 10 guineas, and Mr. Cecil H. Hooper £5.

THE UNITED HORTICULTURAL PROVIDENT AND BENEFIT SOCIETY.—The annual general meeting of the members of this Society took place on the 10th instant, at the Caledonian Hotel, Mr. J. WIGNAR presiding, and there was a good attendance of members. The annual report of the committee stated that the progress of the society during the past year had been most satisfactory, that at the close of the year there were 301 subscribing members, and that this number had been increased to 312 by subsequent elections. The amount of sick pay disbursed during the year was £37 15s. 4d., a little more than in the previous year, and this amount had been divided between twenty members; the payments being covered by deductions from members' subscriptions according to the rules. At the present time there are four sick members on the fund, and one death had occurred during the year. The balance in favour of the Benefit Fund is £347 18s. 11d., an increase of £400 during the year. The balance in favour of the Benevolent Fund is £146 14s. 10d., and no call whatever has been made upon that fund during the year just closed. The Management Fund was also in a very satisfactory position, the total receipts from contributions of members and the annual subscriptions of honorary members for the year amounts to £127 15s. 10d.; the total expenditure under this fund is £106 2s. 8d., including payment to the secretary for the year, leaving a favourable balance of £21 13s. 17d. The treasurer's balance sheet, which is a compendium of the three funds, showed that the receipts from all sources, including a balance in hand of £141 13s. 7d. amounted to £923 19s. 17d., from this had to be deducted the payments to sick members as above; Management Fund £86 2s. 8d.; sum voted to secretary £20; purchase of £650 stock at a cost of £365 18s. 9d., brought the disbursements up to £789 3s. 2d., leaving a balance of £134 15s. 11d. to be carried forward to the ensuing year. The society has now invested in Nottingham Borough Corporation 3 per cent. stock the sum of £4000, and in 2½ Government stock the sum of £1250, making £5250 in all. It may be stated that the amount received as interest during the past year was £89 9s. 6d., and members' subscriptions amounted to £459 2s. In an admirable address—not the less to the purpose, or less effective, because it was written—the Chairman moved the adoption of the report and balance-sheet. The basis upon which the Society is founded, and the advantages it offers to members, were set forth in a very lucid and exhaustive manner. The Chairman stated that he had prepared it, not so much for the benefit of that particular meeting, as that it should go abroad to arrest the attention of the gardeners

ODONTOGLOSSUM PESCATOREI, WITH 130 FLOWERS.
